THE EDINBURGH ENCYCLOPÆDIA;

CONDUCTED BY

DAVID BREWSTER, LL.D.

F. R. S. LOND. AND EDIN. AND M. R. I. A.

WITH THE ASSISTANCE OF

GENTLEMEN EMINENT IN SCIENCE AND LITERATURE.

IN EIGHTEEN VOLUMES.

VOLUME V.

EDINBURGH:

PRINTED FOR WILLIAM BLACKWOOD; JOHN WAUGH, EDINBURGH; JOHN MURRAY; BALDWIN & CRADOCK; J. M. RICHARDSON, LONDON; AND THE OTHER PROPRIETORS.

M.DCCC.XXX.
Brown, John, (M. D.) a very extraordinary medical theorist, was born about the end of 1735, or the beginning of 1736, at the village of Lintlaws, or Preston, in the parish of Bunce, in Berwickshire. His father certainly moved in no higher rank than that of a day-labourer, and belonged to the class of dissenters known in Scotland by the name of Seceders,—a sect, at that time, remarkable for austerity of life and solemnity of demeanor. However contracted the notions of the elder Brown may have been on religious topics, he seemed to have been animated by a very laudable desire of communicating to his infant son all the information which his narrow finances could allow; and accordingly we find, that such attention had been paid to the improvement of the boy, as to have enabled him to read the whole of the Old Testament before he had attained his fifth year. His progress in his native language induced his father to send him to the grammar-school of Dunse, which was then taught by Mr Cruickshank, a gentleman whose name is recollected with grateful affection by those whose opportunities best enabled them to appreciate his worth. Scarcely had our author commenced his classical career, when he sustained a severe loss in the death of his father. This event, however, did not retard his mental improvement, for he continued under Mr Cruickshank's care until he was between nine and ten years of age. By that time he had attained the highest rank in the school, which is distinguished in Scotland by the title of Dux.

This may be considered the period at which young Brown's misfortunes commenced. The limited funds of his parents could no longer support the expense of retaining him at school, and he was doomed to be a weaver. As might have been anticipated, he did not long remain in this truly mechanical employment; the exact period is not ascertained, but it is sufficiently known, that he owed his change of situation to the liberality and favour of his old teacher, who having offered to give him gratuitous instruction, induced his mother and his step-father to forego his original destination, and to look up for him to the dignity of a seceding preacher. His progress in his studies, on resuming them, justified the high opinion which Mr Cruickshank had formed. He soon regained his lost ground; and, in the absence of the master, always presided and maintained order. It is probable that, between his twelfth and thirteenth year, the occurrence took place, which, in some measure, determined his future fate. He had been educated in all the severity of puritanism; but having on one occasion been tempted to "hear a sermon in the established church of Dunse," he was summoned to appear before a meeting of the seceding congregation; where he had every reason to expect a very severe censure: this his proud spirit could not easily brook, he immediately renounced his sect, and declared himself a member of the established church—an event which the seceding church may regret as long as it exists.

With his change of doctrine, a corresponding change in his hitherto habitual gloominess of manners took place; and some have asserted, that that freedom, with regard to religious concerns, which he afterwards strongly displayed, became very perceptible even at this period; indeed, the effect is what will be very generally produced on persons possessed of vivid but ill regulated feelings.

About his thirteenth year, his proficiency in literature was so considerable, as to induce Mr Cruickshank to appoint him usher to his school, in which situation he remained between five and six years.
During this time he devoted himself to the duties of his employment, and to his improvement in Greek and Roman literature:—It may be here remarked, that he distinguished himself among his companions, not only by his superiority in his studies, but also by his skill in almost every athletic exercise—wrestling, boxing, and running, were his favourite recreations.

On quitting the situation of usher to Mr Cruckshank, he went into the family of a neighbouring gentleman, as tutor to the children. There he did not long remain; but whether his removal was owing to the insolence of the gentleman with whom he lived, or to his adding “the stiffness of pedantry to the sourness of bigotry,” is a point at issue among his biographers: we strongly suspect that each of these causes may have had some effect, though bigotry probably had the least.

On leaving the family of which he had so recently become an inmate, he proceeded to Edinburgh, and attended the philosophical classes with success; he afterwards made some progress in his theological studies; but his attention was soon diverted from the latter to medical speculations, by his having accidentally translated a thesis, or inaugural dissertation, into Latin, which at once exceeded the expectations of his employer, and gave a new impulse to his genius.

Having resolved on altering the course of his life, he returned to Dunse, and resumed his labours as usher—the duties of this humble though important office, he performed from Martinmas 1758 to the same term in 1759. He then returned to Edinburgh, and a vacancy having occurred in the High School of that city, he became a candidate to fill it; but being destitute of a patron, he failed, as usual in all similar cases, and was left to struggle against adversity, with the embarrassments that appear almost incidental to talent.

Though disappointed, he did not despair, but applied with vigour to his medical studies; and, as a preliminary step, addressed a Latin letter (which is said to be pure and elegant) to the late venerable and acute Dr Monro, stating his necessities, and requesting the privilege of free admission into the Anatomical Theatre: So successful was this first application, that he was encouraged to address the remainder of the Professors of the University of Edinburgh;—it need scarcely be added, that their liberality equalled his highest expectations. We feel proud in thus recording an event, which we are also proud to add, has many parallels at the present time.

Thus encouraged by the favour of his teachers, John Brown entered on his medical career, and prosecuted it with an ardour that was amply compensated by his success. During his labours for two or three years, he supported himself by teaching the classics; but afterwards, finding himself qualified to promote the studies of the more advanced students, he abandoned his early occupation, and engaged in that profession which is technically phrased among the young men of the university “grinding.” As this is a profession little known beyond the precincts of the college of James the Sixth, it may be proper to give some account of its origin and history. It is well known, that among the multitude of young men who crowd to Edinburgh to receive medical instruction, there is a very abundant proportion whose literary attainments are remarkably humble; many of these young men, on being initiated into societies, and on learning that they can talk as well as wiser men, aspire to the highest dignity of the science. Not being possessed of Latin enough, either to write the inaugural dissertation, or to undergo the various examinations to which every candidate must be subjected, it becomes necessary to employ some one qualified to execute the first, and to afford such rapid instruction as may enable them to overcome the mighty difficulties which oppose their progress. Some young man, fitted by talent and experience to exercise this calling, engages in it, and is called a “grinder.” A name particularly expressive, when we consider its origin. It is but justice to add, that these grinding performers are sometimes employed by men of education and talent, who are indolent, and wish speedily to be familiarized with colloquial Latin.

Previous to Mr Brown’s engaging in this new profession, we have mentioned that he acted as a private teacher; and in that capacity he attended the family of the late Dr Cullen, who continued his patronage for as long a time as circumstances permitted. In 1761, Mr Brown became member of the Royal Medical Society of Edinburgh,—a society which can boast of having been upheld by the voluntary support of the students for upwards of seventy years, and of having enrolled the most distinguished medical philosophers among its members during that period.

Under the distinguished patronage of Cullen, Brown opened a boarding-house for the students of the university; the profits of which, with those of his profession, enabled him to marry. About this time he had the privilege of illustrating, every evening, the morning lecture of Dr Cullen, and for this purpose he was entrusted with the manuscript. But in spite of all these advantages, Mr Brown’s total want of economy, and of attention to those matters which claim the notice of every honest man, soon involved him in pecuniary difficulties, from which he never appears to have been ever after freed. A compromise with his creditors at this time relieved his most urgent necessities.

After these unfortunate events, he laboured very hard, in hopes of obtaining a professorship in one of the infant seminaries of North America, then belonging to Great Britain; but this expectation was disappointed. He subsequently ascribed his want of success to selfish motives on the part of Dr Cullen: but it does not appear to have been a well-founded suspicion. Soon afterwards, he was farther disappointed in his views towards the chair of the Theory of Medicine, to which the present Dr Gregory was then elected. This event, which he also ascribed to the unfair conduct of his old patron, was followed by his rejection on applying to become a member of the society which published the Edinburgh Medical Essays;
which completed the breach between the professor and his quondam friend. Without better information than can be easily obtained at present, we cannot pretend to decide how far Brown's allegations may be founded in truth, or if Dr Cullen had not some cogent reasons for having withheld his support on the occasions stated. It is not improbable that the irregularities of the former might have had their share in determining Dr Cullen's conduct, even if we adopt the very partial statement made by Brown's advocates: The whole of Mr Brown's speculations with respect to professorships having failed, he applied most diligently to grinding, and employed the manuscript of his "Elementa Medicina," as his text-book. His most sanguine expectations were exceeded by the progress which his opinions made among the students. Nor is it at all wonderful, when we consider the materials which compose the great body of medical students in the university of Edinburgh.

In the autumn of 1779, Brown took the degree of Doctor of Medicine at the University of St Andrew's, dreading lest his rupture with the professors of Edinburgh would thwart his wishes, had he attempted to realise them there. St Andrew's is celebrated for conferring degrees without residence, or even previous study, if the candidate be recommended by two physicians known to the university.

About this period, the contest between his partisans and those of his opponents, were carried to the highest possible pitch. The zeal of one party to convert, and the distaste of the other to be converted, produced all the effects consequent on such extreme absurdity. No man possessed of common understanding, would quarrel with another for differing with him on medical topics. But, strange to relate, many duels were fought to determine whether opium was a stimulant or a sedative.

Probably about this time Dr Brown discovered, that the medical practitioner, who devotes himself to the useful though unambitious pursuit of his profession, must anticipate no higher reward than the ephemeral applause which success, even in the hands of a blockhead, cannot fail to procure; while those who venture into the dangerous regions of medical speculation and controversy, may not only enjoy all the advantages that result to their less ambitious brethren, but have the further satisfaction of being regarded as the founders of systems equally vague, hypothetical, and untrue, as those of their predecessors. The foregoing conjecture is in some measure confirmed by the publication of the first edition of the "Elementa Medicina," in 1780.

The next five years do not appear to have been occupied by any remarkable event. In 1785, the Doctor instituted the masonic lodge of the Roman Eagle. His views have been variously stated; but it is scarcely fair to seek for motives, when we have some of considerable weight assigned in the obligation signed by all the members of this institution. During this period, as well as every other, Dr Brown's inattention to his concerns involved him in continued difficulties; and once, it is recorded by one willing to palliate every error, he was reduced to the necessity of concluding a course of lectures in prison, to which his imprudence had carried him. Borne down by this continued train of misfortune and misery, he left Edinburgh with a wife and eight children for London, there hoping to retrieve his lost opportunities of comfort. Soon after his arrival in the metropolis, he delivered three successive courses of lectures at the Devil's Tavern; but being scantily attended, his profits were small. He also received a small sum from Johnson of St Paul's Churchyard, for the translation of his "Elementa Medicina."

It seems that a paltry intrigue disappointed him with regard to a situation offered to him by the Great King of Prussia; and a still more paltry revenge cast him into the King's Bench prison. By some means, too, it is said, that on a former occasion he lost the appointment to the Professorship of Medicine in the University of Padua.

During this unfortunate man's confinement in the King's Bench, he was solicited, by an eminent London bookseller and four associates, to contrive some nostrum, for which his name would secure an extensive sale. The coadjutors never making any specific proposal as to the quantum of reward to be received by the Doctor, the business was dropped. It is said that their intention was as knavish as it was illiberal. Availing themselves of Brown's necessities, they intended to increase his difficulties so much as to render any sacrifice acceptable. Then the nostrum might be had on easy terms. The liberality of two gentlemen, Mr Miller, and Mr Madison of Charing-cross, averted this overhanging calamity; and, in the course of the year 1788, Dr Brown was restored to his family, in Golden-square. There he commenced a new set of speculations. He published a translation of his Elementa Medicina; he proposed a new edition of his Observations; a Treatise on the Gout, and on the Operation of Opium on the Human Constitution; a new edition of the Elementa, with additions; A Review of Medical Reviewers,—as the labours of the first year:—and, as those of the second, a volume of notes and illustrations of the Elementa; a second volume of Observations; and as much practice as he could get. In the midst of these anticipations of industry and of success, a stroke of apoplexy put an end to his life on the 7th October 1788, in the fifty-third year of his life.

That Brown was a very extraordinary man, cannot be doubted. His early acquisition of knowledge; his unwearied diligence, and acuteness of reasoning, point him out as a man fitted for a high sphere;—but his irritability, his intemperance, his want of religion, and of a due attention to the claims of his rising family, lessen the respect which his talents create. His faults appear in spite of the veil which affection has attempted to draw over them. None of his errors are more striking than his total want of prudence: his fate proves, very decidedly, the truth of Johnson's celebrated observation, "that nothing can supply the want of prudence; and that negligence and irregularity, long continued, will..."
make knowledge useless, wit ridiculous, and genius contemptible."

Dr Brown's style has been often the subject of debate among his admirers and opponents. It appears to us often perplexed, sometimes vigorous, but coarse: his arguments are ingenious, and acutely managed; but the dogmatism with which he decides questions that can only admit of probable reasoning, disgusts even those who may be disposed to be pleased. His classical acquirements were very great; but he seems to have studied the more perplexed authors as his models in composition.—a circumstance which has tended not a little to lessen the number of his admirers, particularly since it has been urged, with more vehemence than truth, that this obscurity is consistent with the purest models extant. Cicero, however, is no less remarkable for purity of style, than for perspicuity and simiplicity.

Upon the whole, we are disposed to think, that the panegyrist of our author have too highly extolled, and his opponents have too much viliied, his works; for although they undoubtedly do not promise that benefit to mankind which the former have anticipated, yet they have not produced such evil effects as were predicted by the latter. On the contrary, they have introduced somewhat more precision than formerly existed, into our medical reasonings, and have drawn the attention of physicians to many of those whimsical hypotheses which, under the sanction of illustrious names, had been generally admitted, from a want of examination.

Dr Brown's acknowledged works, are, his Observations, the Elementa Medicine, and the Translation of the latter. His unacknowledged works, including inaugural dissertations, and various tracts, are said to be very numerous.

We shall conclude this article with a brief sketch of the leading features of his doctrines, as given in the two works abovementioned.

The Brunonian Hypothesis may be reduced to the following principles—the application of which to every individual case, would exceed the limits of the present article.

1. Life, both of animals and vegetables, is constituted by three states, health, disease, and predisposition.

2. In each of these three states, animated beings are liable to be affected by certain external, or by certain internal causes, which produce the proper functions. These different agents are, 1st, Heat, food, wine, poisons, contagions, the blood, the secreted fluids, and air. 2d, Muscular contraction, sense, "the energy of the brain in thinking, and in exciting passion or emotion."—Death is consequent on the cessation of their agency on the living system.

3. The principle on which the phenomena of life depend, is called Excitability; the agents affecting this principle, are called the exciting powers; and the effect produced by the latter on the former, is named excitement.

4. The excitability differs in different individuals, and in the same individual at different times. Accordingly, the exciting powers will vary in their effects, in proportion to the vigour of the excitability.

5. Exciting powers should be also named stimuli. They are either general or local. The first are those which act on the excitability in such a manner as to produce excitement over the whole system. The second act only on the part to which they are applied.

6. Life is a forced state, and consequently its continuance in perfection depends on the due action of the stimuli on the excitability. Health, then, is maintained by the exertion of natural stimuli on the excitability.

7. But whenever they are unnatural, or act with too much energy, the excitability is exhausted, and the excitement becomes greater than it ought to be. This is a state to which Dr Brown gave the name of sthenic diathesis, which predisposes to sthenic disease. This diathesis, or predisposition, may be increased very considerably by injudicious management.

8. After excitement has been carried to its utmost pitch, it ends in indirect debility, which gives rise to asthenic diseases.

9. Indirect debility is induced by the excessive action of stimuli, or by their too great intensity. The excitability is then supposed to be exhausted.

10. Direct debility is, on the contrary, induced by a defect in the stimuli, or by their feeble action.

11. These two species of debility differ most essentially, and are sufficiently characterised. They exist in health as well as in disease. Indirect debility occurs in old age, and direct debility in youth or infancy.

12. Sleep is the effect of both kinds of debility, either separate or conjunctly.

13. Every power that acts on the living frame is stimulant. This principle is supposed not to be affected by any circumstances whatever.

14. Excitability exists in the medullary portion of the nerves and in the muscles. It sympathises in every part of the system. That is, different parts can never be in opposite states of excitement.

Dr Brown contrived two scales, the first of which he divided into 90 degrees, shewing the quantity of excitability given to every being at the commencement of its existence. The second "points out the ascending and descending progression which the exciting powers observe in acting on the excitability."

Such are the outlines of the system of Dr Brown. With all its ingenuity we must still hesitate in adopting it, until we can obtain something more than the blending of some truth with much conjectural hypothesis. We dislike the phraseology, and still more the arrogance, with which both the author and his followers have asserted their infallibility.

Still, however, it cannot be denied, that some of the conclusions have proved more useful than was at one time expected.

It, fortunately, is a matter of very little moment, how physicians theorise. Few, even the devoted disciples of Dr Brown, would follow the example of that gentleman, and venture on prescribing wine, high living, and opium, in gout. The use so liberally made by Brown and his proselytes of the term demonstration, as applied to the doctrines above
sketched, cannot fail to excite the ridicule of those
who, from having attended to the nature of medical
inquiries, have been convinced that doubt and ob-
scurity must overshadow every step of the physiolo-
gist and physician, until certain fundamental facts be
ascertained, which the present faculties of mankind
are not likely to develop. See Brown's Writings
and Life, by Dr Beddoes; and The Works of Dr
John Brown, an English divine of the
sixteenth century. He was first a schoolmaster, and
next a lecturer at Islington; and soon distinguished
himself by travelling through various parts of Eng-
land, and inveighing against the discipline and ordi-
nances of the established church. Being brought
before the bishop of Norwich, he was, in the year
1550, committed to the custody of the sherif of the
county; but, upon an acknowledgment of his of-
fence, he was released. This salutary chastisement,
however, soon lost its effect upon Brown's ardent
and captious spirit; he returned to his former ambus-
latory life; preached and wrote against the church
of England; and suffered frequent imprisonments, as
a punishment for his offences. At length his fol-
lowers assumed the name of Brownists; separated
from the church, and formed themselves into a
society, which refused to join with any other
Christian society in the public offices of religion.
Brown's restless and turbulent spirit soon made it
necessary for him to quit the kingdom; and having
settled at Middleburgh, in Zealand, in 1582, he and
his followers obtained leave of the States to worship
God in their own way, and to form a church accord-
ing to their own model. There he might have lived
and died unmolested; but opposition seems to have
been more congenial to his spirit. In a few years
he returned to England, and brought with him all his
former hostility to the church. Having been cited
to appear before the bishop of Peterborough, he re-
fused to comply; and the sentence of excommunica-
tion was pronounced upon him, as a punishment for
his contempt. It is said, that he was deeply affect-
ed with the solemnity of that censure; and having
some years afterwards renounced his principles of se-
paration, and returned to the communion of the
church, he was preferred to a rectory in Northam-
ptonshire. There, according to Fuller, he lived an
idle and dissolute life, neither beloved nor respected;
and having quarrelled with the constable of his pa-
rish about the payment of certain rates, he was, by
order of a justice of the peace, thrown into gaol,
where he died in the year 1630, in the 81st year of
his age, after having boasted that he had been com-
mitted to no fewer than thirty-two prisons, in some
of which he could not see his hand at noon-day.

The followers of this extraordinary man differed,
not in doctrine, but in discipline, from the church of
England; yet they carried their hostility to her so
far as to maintain, that her ministers were unlawfully
ordained, that her discipline was Popish, and that her
sacraments and institutions were invalid. Nay, they
not only renounced communion with her, but also
with all other religious societies, whose constitution
was different from their own. In the formation of
their churches, it was required that the members
should subscribe a confession of faith, and an obliga-
tion to conduct themselves according to certain spe-
cified rules. When they became too numerous to
meet in one place, they divided into separate societies
or congregations, each of which was accounted a
complete church, and enjoyed all the rights and privi-
leges competent to an ecclesiastical community. The
whole power of governing each congregation, of ad-
mitting and excluding members, and of deciding all
controversies, resided in the people; and each mem-
ber was allowed an equal share in the government,
and an equal right to order all matters for the good
of the whole society. No one church was entitled
to exercise jurisdiction over another; but each might
give the other counsel or admonition, when at any
time their conduct was deemed disorderly, or when
they departed from the fundamental truths of reli-
gion; and if the offending church did not receive the
admonition, the others were commanded to withdraw
from communion with them, and publicly disown
them as a church of Christ. It was the congrega-
tion, also, that elected the pastors, and other office-
bearers of the church, for the ministry of the word,
and for taking care of the poor; to which they were
appointed by fasting, and prayer, and imposition of
hands; but reserving always the power of dismissing
them from those offices, whenever they should think
such a change conducive to the spiritual benefit of the
community. For these pastors assumed no au-
thority over the congregation, nor differed in any re-
spect from their Christian brethren, except in the
privilege of discharging the duties of the ministerial
office. Neither was that office peculiar to them
alone; for any member of the congregation might
publicly teach and exhort; and many availed them-
selves of that privilege, when the discourse of the
ordinary pastor or teacher was finished. On the other
hand, the powers of the church-officers were confi-
ded within the narrow bounds of their respective con-
gregations. No pastor was permitted to preach, nor
to administer the sacraments, except in his own
church; and all set forms of prayer in public wor-
ship were strictly prohibited. In a word, every
church, or society of Christians, meeting in one place,
was, according to the Brownists, a body corporate,
having full power within itself to regulate all matters
for the good of the community. It would seem that
Brown had wished to form his church upon the mo-
del of the infant church, in the days of the apostles,
without considering the important changes, both ci-
vil and religious, which have taken place in the state
of the world since that time, and the influence which
these must necessarily have on all ecclesiastical esta-
blishments.

After continuing for a period of nearly one hun-
dred years, the Brownists gave birth to the Inde-
pendents, who adopted the greater part of their disci-
pline. See Neal's Hist. of the Puritans, vol. i. p. 328;

ndelphia, and order Endecandria. See Botany, p.
267.

BRUCE, ROBERT, King of Scotland, was born
Bruce, Robert.

on the 11th of July 1274. He was the son of Bruce, Lord of Annandale, and Martha, Countess of Carrick, and the grandson of Robert Bruce, the co-heir with Baliol for the Scottish throne. Exiled from his native country by the ambition of his father, he passed his youth at the court of England.

In expectation of obtaining a crown, the elder Bruce had enlisted under the banners of Edward, and carried arms against his countrymen. After the battle of Falkirk, he agreed to a conference with Sir William Wallace.* On the banks of the Carron, that undaunted warrior vented the indignant feelings of his generous spirit. He upbraided Bruce as the mean hireling of a foreign master, who, to gratify his ambition, had sacrificed the welfare and independence of his native land; and who, instead of courting the glorious distinction of delivering his country, or of falling in asserting her liberties, had cowardly deserted that post which his birth and fortune had entitled him to assume. These reproaches sunk deep into the heart of Bruce. They opened his eyes to the degeneracy of his conduct, and it is said that he died soon after of grief, occasioned by reflecting on his past meanness. He, however, bequeathed to his son the legacy of atonement, and exhorted him, with his dying breath, to revenge the injuries of his suffering country. Young Bruce was eminently qualified for becoming the champion of independence. Educated at the court of a warlike monarch, few could equal him in the exercise of arms; and with a mind intrepid and enterprising, he possessed a constitution capable of bearing the deprivations and hardships of a military life. The injunctins of his dying father were engraved on his heart; and the death of Wallace, leaving the Scottish patriots without a leader, opened the way for Bruce's exaltation to that arduous station. From that hour he thought only of delivering his country from oppression, and his whole soul was absorbed by the mighty attempt. Cumming, Lord of Badenoch, who had been Regent of Scotland in the name of Baliol, and who had often fought by the side of Wallace in resisting the tyranny of the English, was his only rival for the throne, and the chief bar to the success of his design; and he could not but perceive, that openly to assert his right to the crown in the face of such a powerful adversary, was only to involve his country in deeper misery, and to expose his cause to certain destruction. It was necessary, therefore, to secure the co-operation of Cumming in this great undertaking, and accordingly he entered into a compromise with that nobleman, by which he agreed to resign to him all his family estates, on condition that he would give him his utmost assistance and support in the execution of his design.† But the treachery of Cumming relieved him from his engagement; and, by exposing him to the suspicions of the King of England, hastened the accomplishment of his determined purpose. Bruce, being secretly informed of the hostile intentions of Edward, who had attempted to draw his brothers into his power, and had determined to free himself from future uneasiness, by extirpating the whole family, found means to elude his vigilance, and hastening to Scotland, assembled his friends in the castle of Lochmaben, and avowed to them his intention of assuming the crown. They all swore to live and die in his service—they acknowledged him as their sovereign, and immediately proceeded to take measures for restoring liberty to their country. Their safety and success imperiously demanded the death of Cumming. His treachery and his power rendered him obnoxious to their cause, and they could not expect that he would abandon the interests of Edward to support the pretensions of a rival. Though the circumstances attending his death have been disputed by historians, yet it is allowed by all that he fell by the hand of Bruce. This deed sealed the revolt of the patriots. The honour and the interest of Edward called loudly for vengeance; and the open violence with which it was executed, deprived them of all possibility of reconciliation. Bruce had now no alternative left but death or a crown; and he determined to persist, at every hazard, in his design, rather than expose himself to the ignominy of submission. He was enrobed at Scone, on the 27th of March 1306. But such a series of disasters succeeded, as had almost crushed his exertions and his hopes. His wife and daughter fell into the hands of the English, and he himself and a few followers, after having endured all the extremities of hunger and fatigue, were at last compelled to take refuge from the fury of their enemies in the island of Ralchrin.‡ Here he and his party were hospitably received, and provided

* Though this conference has been mentioned by all the Scotch writers, yet it has been represented by Lord Hailes as a story absurd in itself, and without any foundation in truth. Where its absurdity lies, we leave our readers to discover. With regard to its validity, we may observe, that his Lordship's remarks refer entirely to young Bruce, and consequently cannot here apply; and we may mention, that some historians not only affirm that the elder Bruce was in the battle of Falkirk, but that he was at the head of the Galloway men, his vassals, and that it was owing to his attacking the Scottish army in the rear, that the brave Wallace was compelled to retreat.

† Some historians have been inclined to suspect the truth of this, but we believe that when Bruce demanded of Cumming whether he would befriend him in his design, Cumming dropped some warm words, which occasioned his being wounded by Bruce. Guthrie's Hist. of Scot. vol. ii. p. 173. Others again deny that Bruce had any design of asserting his claim to the crown, and that the death of Cumming was the consequence of a hasty quarrel between these proud-spirited rivals. Hailes' Annals, vol. i. p. 292. This agreement, however, is mentioned both by Barbour, 17, and Fordun, xii. 5; and Hemingford seems also to insinuate treachery on the part of Cumming; for, when speaking of the conference between these noblemen, he says of Bruce, "Carpit improperare ei de seditione sua, quod cum accusaverat apud Regem Angliam, et suam conditionem deterioraverat in damnum ipsius." T. i. p. 219. We believe that the real nature of this fatal quarrel is unknown. In such circumstances, therefore, we thought it best to follow the common tradition.

‡ This island lies off the coast of Ireland, and it is said that Bruce here composed a Latin consolatory poem, of which two lines are only now extant.

"Ni me Scotiae libertas priscis moveret, Non tamquam peto orbis ob imperium."
BRUCE.

Bruce, Robert.

with every necessary; and here he so effectually concealed himself, that he was generally believed to be dead. Fearing, however, that such a report might discourage his adherents in Scotland, and induce them to submit to Edward, he resolved to make another effort for the recovery of his rights. Passing secretly over into Arran, he dispatched a faithful domestic into Carrick to discover how his ancient vassals stood affected to his cause. He himself, with his friends, soon after followed. Upon their landing, they immediately learnt that the whole country was in the possession of the English, and that there appeared no hope of assistance. Surrounded with dangers, Bruce hesitated for a moment upon what to resolve; but his valour and despair soon dispelled every consideration of danger.

"Here shall no peril that may be
Drive me e’eroms unto the sea;
Mine adventure here take will I,
Whether it be easy or angry."

BARBOUR, p. 91.

With three hundred followers, he surprised the English in their cantonments, took the castle of Turnberry, and put the garrison to the sword. From that day his party rapidly increased; and, after eight years of incessant warfare, attended by the most glorious successes, the decisive battle of Bannockburn blasted the hopes of Edward, and secured the independence of Scotland. Bruce was now firmly established upon the throne, and from being a wandering outcast, fighting for his very existence against the tyranny of Edward, he became a powerful monarch, carrying terror and desolation into the territories of his adversary. The remainder of his life was, in a great measure, spent in active warfare, but his offensive operations were too extensive to be completely successful; and his attempt upon Ireland was undertaken, not so much to harass his enemy, or to extend his power, as to gain a kingdom for his brother Edward, whose ambition, unable to brook the authority of a superior, would otherwise have enslaved his country in a civil war. Worn out, at length, with the fatigues and exertions of an eventful life, and after having concluded a peace with England, most advantageous and honourable to Scotland, and worthy of her long struggle for independence, Bruce died at Cardross, on the 7th of June, 1329, in the 55th year of his age, and the 24th of his reign. On his death-bed, he requested, that as he had often purposed to visit the Holy Land, his heart should be carried thither, and deposited at the sepulchre of our Saviour. Sir James Douglas, who had been long his companion in arms, and his faithful adherent through every variety of fortune, was chosen to fulfil the wishes of his dying master. But this mournful duty was never performed; for we are informed by Barbour, that Douglas, on his way to Jerusalem, landed in Spain, where he fell in battle against the Moors. The royal heart was brought back to Scotland, and buried in the church of Melrose.

Bruce was twice married; first to Isabella, daughter of Donald, Earl of Mar, by whom he had Marjory, married to Walter, the Stewart of Scotland, whose son, Robert II. was the first monarch of the line of Stuart. By his second wife, Elizabeth, daughter of Aymer de Burgh, Earl of Ulster, he had David II. who succeeded him, and two daughters.

As a warrior, Robert Bruce found no equal in the age in which he lived; and it is impossible, by any delineation of ours, to do justice to that undaunted valour which no dangers could dismay; to that energy of soul which rose superior to every misfortune; and to that unwearied perseverance which, under circumstances the most adverse and distressful, led him, with a steady step, to the accomplishment of his design. In Scotland, his name will ever be remembered with gratitude and admiration. From the many salutary regulations which he introduced into his government, he seems to have had a sincere affection for the liberties of his subjects; and, by a wise and vigorous administration, he curbed the irregularities of a people who had been long accustomed to anarchy, bloodshed, and plunder. See Guthrie’s Hist. of Scot. vol. ii. p. 193, &c. Hume’s Hist. of Eng. vol. ii. p. 333, &c.; Hume’s Annals of Scot.; and Barbour’s Life of Bruce.

BRUCE, James, one of the most enterprising of modern travellers, was born at Kinnaird, the residence of his family, in the county of Stirling, in Scotland, on the 14th day of December, 1730. Bruce’s family was ancient and respectable, and many of his ancestors had made a distinguished figure both in church and state. Of the early life of Bruce few particulars are known; though strongly formed, he did not promise, when a child, that athletic constitution and stature which he attained in manhood: and his temper, contrary to what he afterwards assumed, was gentle and quiet; as he advanced in life, it became bold, hasty, and impetuous, accompanied however with a manly openness, that showed a warm and generous heart.

When about twelve years of age, he was sent to the school at Harrow on the Hill, in the vicinity of London; where he is said to have made rapid progress in classical literature. He was particularly attentive in acquiring the accomplishments of fashionable life; he spent most of his leisure time in sports of the field, and attained great dexterity in shooting; a qualification which he turned to good account in the course of his hazardous travels. He was intended originally for the profession of the law; he does not appear to have been fond of this profession; and his copy of Heineccius’s Institutes, which is still in the possession of the family, is scribbled over with verses from the Italian poets. At last he relinquished the study of the law altogether, and turned his thoughts towards India; he was prevented however from carrying his intentions into execution, by forming an acquaintance with the family of a Mrs Allan, the widow of an eminent wine merchant, whose daughter he married; in consequence of this connection he settled in London, as a partner in the wine trade with Mrs Allan’s son. In a few months after their marriage, Mrs Bruce exhibited evident symptoms of consumption; and it was deemed necessary to try the mild climate of the south of France. She expired, however, at Paris; and such was the bigotry of the Roman Catholics at that time, that she was scarcely permitted.
to die in peace, and her distracted husband had to
steal for her a grave at midnight, that he might avoid
the unhallowed insults which bigotry thought it me-
ritorious to offer to the remains of a heretic.

Mr Bruce continued for some time in the wine
trade, and in the way of his business, travelled over
the most of Spain, Portugal, and the Netherlands.
When at Brussels he was involved in a quarrel with
a person who had behaved rudely in his presence, to a
young gentleman, whose appearance had prepossessed
Bruce in his favour. This quarrel was decided by
the sword; and Bruce having wounded his antagonist,
as it was thought mortally, was obliged to leave the
Netherlands. Having received accounts of his
father's death, who died at Edinburgh, in 1758, he re-
solved to return to England. Though he succeeded
to a respectable fortune, it was by no means adequate
to the demands of his ambition. As he possessed
great facility in acquiring languages, he began to de-
vote himself to the study of the Arabic and Ethiopic,
prompted at first in all probability, by mere curiosity;
but it is not unlikely that the world owes to this cir-
mumstance the fruits of his valuable travels. In
1761 Bruce withdrew from the wine trade, which he
had carried on for seven years, in company with his
brother-in-law. He now began to engage in politics,
and proposed the plan of an expedition against Fer-
rol, which was favourably received by the ministry,
and even resolved on, but never carried into execution.
Bruce being disappointed in his views, resolved to re-
turn to Scotland, and spend his time as a country
gentleman. Lord Halifax laughed at the idea, and
suggested Africa to him as a proper field for enter-
prise and discovery; and that he might go under the
protection of a public character, it was proposed to
send him as consul to Algiers. Bruce acceded to
these proposals, and left Britain in the end of June
1762. He passed through France and Italy, and
carried with him from the latter country an artist to
assist him in his drawings. His residence at Algiers
was rendered extremely uncomfortable, and he was
at last superseded by the influence of a party. He
obtained permission from the Dey to travel through
the interior provinces, from thence he passed into
Syria, visited Balbec and Palmyra, and at last pre-
pared for his great enterprise, the journey into Aby-
sinia, to explore the sources of the Nile. As he had
resolved to travel in the character of a physician, he
received books and instructions respecting the diseases
of the east from Dr Russel at Aleppo. He sailed
up the Nile a considerable way, and then joined the
caravan to Coseir on the Red Sea; from thence he
passed over to Jidda, and visited a considerable part of
the sea coast of Arabia. The journal which he kept
of the occurrences in Egypt and Arabia is extremely
interesting; but our limits prevent us from entering
into a detailed account. After furnishing himself
with numerous letters of recommendation, a precau-
tion which he never neglected, and to which he owed
his safety, he sailed for Massowah, the only practi-
cable entrance into Abyssinia. He was here exposed
to the greatest danger from the villany of the Naye,
and with difficulty escaped with his life. It is quite
impossible to give an account of his proceedings in
Abyssinia, of the honours which were conferred upon
him, of the strange occurrences which he records, or
of the difficulties which he encountered in prosecuting
his grand object, the discovery of the sources of the
Nile. He at last accomplished his object, and his
feelings on that occasion were of a very singular and
mixed character: at first he felt a degree of exulta-
tion that he had seen what he imagined no European
had ever seen before him, but instantly the most af-
flicting dejection overpowered his spirits when he
compared the small utility likely to result from his
labours, with the difficulties which he had already
experienced, and which he had again to encounter.
Abyssinia was at that time distracted by factions, and
involved in a civil war. With great difficulty he ob-
tained leave to return; and to avoid the danger which
he apprehended at Massowah, he resolved to return
by Sennaar. The dangers and difficulties which he
encountered in this route were almost unparalleled.
We have no hesitation in saying, that the whole of
his narrative, from the time that he entered Abyssinia,
till he reached Syene in Egypt, by the way of Sen-
naar, is the most interesting detail to be found in any
language. His constitution had been much impaired
by his residence in Abyssinia, and the Guinea Worm
which had entered his leg, having been broken in the
extracting, had almost cost him his life. He resided
for a considerable time after his return, in the south
of France, for the benefit of his health, and lived on
the most intimate footing with the celebrated Count
de Buffon, who acknowledges his obligations to him
for several important communications on the subject
of natural history. He at last settled in his native
country, and on his paternal inheritance. In 1776, he
married a daughter of Thomas Dundas, of Fingask,
Esq., by whom he had three children, two of whom,
a son and a daughter, are still living. After he set-
tled at Kinnaird, his time was chiefly spent in man-
ging his estate, in preparing his Travels for the press,
and other literary occupations. He retained to the
last his fondness for field sports. He was preparing
a second edition of his Travels, when death prevent-
ed the execution of his design. On Saturday, the
26th of April 1794, having entertained some com-
pany at Kinnaird, as he was going down stairs about
eight o'clock in the evening, to hand a lady into a
carriage, his foot slipped, and he fell down head-
long from about the sixth or seventh step from the
ground. He was taken up in a state of insensibility,
without any apparent contusion, and expired early
next morning.

Such was the end of this celebrated traveller, who
uniformly ascribes all his wonderful escapes to the
hand of Providence, by whose inscrutable decrees
he was thus summoned from the world. His stature
was six feet four inches; his person was large, and
well proportioned; and his strength correspondent
to his size and stature. He found no difficulty in
acquiring languages of any kind; he understood
French, Italian, Spanish, and Portuguese. Besides
Greek and Latin, which he read well, he knew the
Hebrew, Chaldee, and Syriac; he read and spoke
with ease, Arabic, Ethiopic, and Amharic: he was
a good practical astronomer, and his drawings are
admirable. No author ever experienced such un-
gentlemanlike treatment from reviewers and other
BRUCE.

petty assailants. A parcel of contemptible fools, who had never been out of sight of the smoke of London, had the audacity to aver that he never had been in Abyssinia, and that his book, from beginning to end, was a fabrication. Bruce's temper, which was naturally haughty, served to provoke these attacks; and his vanity, which was very considerable, afforded his enemies an opportunity of saying that he had magnified his exploits and his dangers at the expense of truth. These insinuations, however, gradually died away; and the progress of discovery, though not in the same field, served to confirm all his statements.

But a more serious attack has been made on him lately, by Lord Valentia, who pretends to have detected, by actual observation, not only his inaccuracies, but his falsehoods. This has encouraged some of the journals in which Bruce had been originally assailed, to renew the attack, and to assume credit for their discernment. Lord Valentia did not enter Abyssinia himself, but he dispatched Mr Salt, one of his attendants, whose attention seems to have been particularly employed in endeavouring to overturn the authority of Bruce. Mr Salt has been a second time in Abyssinia, but has not as yet favoured the world with his second thoughts on the subject. We are not afraid, however, to affirm, that no traveller, and no writer of any description, has done so much to confirm the accuracy of Bruce. We beg leave to direct the attention of our readers to the points on which he attacks the veracity of Bruce.

When Mr Salt's party had reached Hamhamou, they were stopt by a violent storm; upon which he observes, that Bruce was exposed to, a storm in the same place, "which, however, he describes, says he, with some exaggeration." Nothing can manifest a stronger propensity to carping and unfairness than this observation. How could Salt know that Bruce's description of the storm was exaggerated? Was it the identical storm which Bruce described that Mr. Salt witnessed? Or did the spirit of the storm appear to him to complain of misrepresentation? In fact, every step that he takes serves to confirm the minute accuracy of Bruce. When he arrives at Tubbo, he is forced to confess, "Bruce has well described this place," Bruce says, that between Shilhokeeb and Hamhamou, he first observed the dung of elephants. It is curious enough, that when Mr Salt comes to the same place, he makes exactly the same observation. Bruce, however, is by far the most accurate coprologist of the two; for he informs us, that the dung which he observed, was filled with the indgested branches of trees, which gives us some insight into the habits of the elephant; but Mr Salt passes on satisfied, with barely introducing his readers to this elegant phenomenon. He passes the tribe of the Hazorta, whose residence he admits to be admirably described by Bruce, and at last comes to the famous mountain of Taranta. He is very severe on Bruce for exaggerating the difficulties of the past, which he and his party cleared in a few hours, whilst Bruce's party took part of two days. He takes no notice, however, of Bruce's quadrant, which took eight men to carry it, whilst Mr Salt's principal box was carried, as he himself informs us, by a boy of thirteen years of age. Besides, Bruce tells us, that the asses turned and ran down the hill to a great distance, which caused a general halt till they were recovered. If Mr Salt had not been blinded by prejudice, he would have acknowledged that none of these causes of obstruction operated in his case; and that, therefore, the ascent of the mountain was comparatively easy. Besides, the road on the mountain was excessively bad in Bruce's time, which Mr Salt confesses was not the case when he passed it.

Mr Salt makes another sneer at Bruce, when he says, "we passed on without observing Troglodytial caves, or being disturbed by hyenas." What a pity that travellers have not better memories, or a little more foresight and consistency! He had said only a few pages before, "we passed a cave inhabited by a family of the natives." And he tells us, afterwards, that the usual mode of building in Abyssinia, is to choose a projecting rock, and after building two side walls, to lay on a roof level with the rock above, which gives the houses all the appearance of caves. He also confesses that many of the churches are more than half caves, the greater part of them being cut out of the solid rock. And as to the hyenas, he had not proceeded far till he tells us the whole party were kept awake by the barking of the dogs, on account of the near approach of these ravenous animals. Bruce describes admirably the appearance of Taranta, covered on the sides with that singular tree the koloukhi, and on the top with the berry-bearing cedar. Mr Salt confirms this description in particular, but falls infinitely short of the graphic style of his predecessor.

Let us now attend Mr Salt to a Brind feast, which excited the wonder and incredulity of the public so much on the publication of Bruce's book. Mr Salt denies expressly that the flesh is eaten while the animal is alive; and yet both he and Captain Rudland, who accompanied him, declare, that the flesh quivered all the time that they were eating it; and it is not easy to conceive how this could be the case if the animal was perfectly dead before it was cut up. Bruce says that it was not fashionable for people of distinction to feed themselves, but that they had persons employed to put the meat into their mouth; this Mr Salt denies. But Captain Rudland, who kept a separate journal, says expressly that they fed one another as boys do magpies in England; and that the Ras, by way of showing his attention, sometimes stuffed him till he was like to burst. Mr Salt declares it as his opinion, that the lascivious scenes which Bruce describes as taking place at the Brind feasts, had no existence but in his own imagination; and yet both he and Captain Rudland say, that they often heard such conversation, and saw such scenes, even in the presence of the Ras and his ladies, as decency would not permit them to describe. Notwithstanding Mr Salt's incessant carping at Bruce, he confesses that his account of the transactions in Abyssinia, whilst he was there, is true in the minutest particular; and he says that he shall never forget the astonishment expressed by the natives at the knowledge he displayed of their history. They looked upon him as a superior being when he exhi-
BRUCE.

bited Bruce's drawings of Gondar. All the persons whom Bruce mentions were well known; many of them were alive, and spoke of him to Mr Salt with great affection. They all agreed that he was a great favourite of the king of the Ituge and of Ozoro Esther. Mr Salt met with the person who was sent to recover Bruce's baggage when he was robbed in his first attempt to reach the sources of the Nile, and also with an old chiefman who was present at the curious hunting match at Tcherkin, when Bruce was on his way to Sennaar. All the persons whom Mr Salt conversed with, agreed in saying that Bruce had visited the sources of the Nile; but it seems they also all agreed in saying that he never was governor of Ras-el-Feel and on this account Mr Salt thinks he is authorised to say, Bruce has told a direct falsehood. We shall submit to our readers a specimen of Abyssinian evidence on this subject, and shall leave lawyers and logicians to draw the conclusion; only premising, that, even according to Bruce's own account, he never took possession of the government of Ras-el-Feel in person, but administered it by deputy.

"At Suez, March 1793," says Browne, in the preface to his Travels, "I met an Armenian merchant, who had formerly traded to Abyssinia, and seemed a man of intelligence. He told me that he was at Gondar when Bruce was there: and that Yakub (the name by which Bruce was known in Abyssinia) was universally talked of with praise. This merchant narrated, of his own accord, the story of shooting a wax candle through seven shields. He observed, that Bruce had been appointed governor of Ras-el-Feel, a province where Arikebe was spoken." "In Dar-Pur," continues the same traveller, "I met a Bergoo merchant, named Hadje Hamed, who had long resided at Sennaar, and was in Bruce's party from Gondar to Sennaar. He said that Yakub had been highly favoured in the Abyssinian court, and lived splendidly. He was often observing the stars, &c. Both my informers agreed that he had been governor of Ras-el-Feel." If this evidence does not overturn that which Mr Salt collected in Abyssinia on this subject, it at least completely neutralises it. If, as Browne's words seem to imply, the Armenian merchant mentioned, of his own accord, without being asked, that Bruce was governor of Ras-el-Feel, we may consider the question as decided in favour of Bruce.

We shall conclude this article in the words of that accurate and profound scholar, Dr. Vincent, who seems to have formed a very correct estimate of Bruce's character. "We ought not to be ungrateful to those who explore the desert for our information. Bruce may have offended from the warmth of his temper: he may have been misled by aspiring to knowledge and science which he had not sufficiently examined; but his work throughout bears internal marks of veracity, in all instances where he was not deceived himself; and his observations were the best which a man, furnished with such instruments, and struggling for his life, could obtain." See Bruce's Travels; Murray's Life of Bruce; Browne's Travels in Egypt; and Vincent's Peripaties of the Eryth. Sea, p. 93. (g)

BRUCEA, a genus of plants of the class Diccia, and order Tetrandra. See Botany, p. 335.

BRUCKER, JOHN JAMES, a learned German author, well known by his laborious and original researches into the history of philosophy, was born at Augsburg, in Swabia, on the 23rd of January 1696. He prosecuted his studies at the university of Jena, where he afterwards continued to reside, for a considerable period, in the capacity of a tutor or private teacher, and returned to his native city in the year 1720. After having attained to some eminence in the clerical profession in other parts, he was, at length, in 1740, appointed pastor of the church of St Ulric's, and senior minister of Augsburg, where he died in the month of November 1770.

Brucker was eminently distinguished by the extent, depth, and variety of his historical and literary attainments; by his indefatigable industry in research, and by the judgment he displayed in the application and arrangement of the knowledge he had acquired. Besides several useful works on subjects connected with ancient and modern literature and philosophy, he is principally known at home, and among foreigners, as the author of the Historia Critica Philosophiae, which was first published at Leipsic in 1742-44, in five volumes quarto, and afterwards, in 1767, and following years, in an enlarged and improved edition in six volumes. In this excellent work, the author gives a biographical sketch of the lives of the different philosophers respectively; reviews their writings, explains their various systems and doctrines, and verifies his narrative by means of a copious exhibition of authorities. These volumes, indeed, contain a biographical and critical account of the ancient and modern philosophers and their works, rather than a systematical history of the progress of science; nevertheless they certainly constitute a most valuable repertory of knowledge, in that particular department of literature, and have proved a highly useful book of reference to those who have since devoted themselves to philosophical researches.

An abridged translation of this work was published by Dr. Enfield, in two volumes quarto, London, 1790. Brucker also prepared an excerpt from his larger work, entitled, Institutiones Historiae Philosophiae, 1746, 1756. Denkmäldgung von dem Leben ausgezeichnet. Teutsch. d. 8ten. Jahrhund. Schnepfenthal, 1802. (z)

BRUGES, formerly a city of the Austrian Netherlands, and a bishop's see, now a city of the French empire, and capital of the Prefecture of the department of the Lys, is situated in a beautiful plain, about eight miles from the sea. It is a spacious and well built town, about a league and a half in circumference; but many of the houses are very old, which give it rather a sombre appearance. Its principal buildings are,—the stadhous, which stands in the great market-place, and has a tower of a very lofty and curious structure; it is square for a very considerable height, and, instead of being surmounted by a spire, another octagonal tower is placed upon it almost as high, which has, however, rather a surprising than a beautiful effect. The cathedral is a massive and ancient building, but many of its ornaments are disfigured by the most incongruous modern additions.
The church of Notre Dame is a very beautiful structure, and its lofty steeples serve as a sea-mark to the ships which frequent the port of Ostend. It contains two tombs of gilt copper, of extraordinary magnificence; and in the treasury are preserved the rich vestments of Thomas a Becket, adorned with precious stones. Besides these, Bruges has several hospitals and schools, where 800 poor children are maintained and educated; and no place in the low countries is more distinguished for the provision which it affords to widows and orphans.

Bruges formerly held the first place among the cities of the Netherlands; and, in the 13th and 14th centuries, was the greatest emporium in Europe. From the imperfection of navigation, a voyage between the Baltic and Mediterranean could not be performed in one season; Bruges was therefore selected as the most convenient station for establishing a magazine, about midway between the commercial cities of the North and those of Italy. Consequently, this city became the staple for the woollen and linen manufactures of the Netherlands, the naval stores and other commodities of the north, and for the Indian as well as domestic productions imported by Venice and the other Italian states. Consuls from every nation resided here, and seventeen palaces or houses are still shown as their ancient habitations. It carried on also a considerable trade with England; and it was declared, by a treaty, to be the only market of the Hans-towns in the Low Countries. The herring-fishery was prosecuted here to a great extent. Indeed, the inhabitants of Bruges were the first who made it an object of commercial speculation; and it was to this city that the Hollanders were indebted for their knowledge of curing their herring, and also for this branch of commerce, which was the first foundation of their maritime strength.

Bruges, now the first in commerce, soon became also the first in opulence and grandeur; and we are told by Guiccardini, that Joanna of Navarre, queen of France, having been some days in Bruges in 1501, was so struck with the splendid dress of the citizens, and the magnificence of their buildings, that she exclaimed, with envy and indignation, “I thought that I had been the only queen here, but I find that there are many hundreds more.” This city, however, which had risen so rapidly to such an eminence in the commercial world, and had flourished so long under the auspices of the Dukes of Burgundy, as suddenly declined. Its success had excited the envy of Antwerp and Amsterdam; and its sovereign, the Archduke Maximilian, against whom they had rebelled, and whom they had even arrested, assisted by these cities, blocked up the port of Sluys in 1487, which destroyed its principal communication with the ocean.

During this rebellion, which lasted for fourteen months, Amsterdam and Antwerp seized the opportunity of drawing its commerce to their own ports, and thus rose upon its ruins to be its rivals, and soon its superiors. Being thus reduced to great straits, and fearful of worse consequences, Bruges implored the clemency of its prince, when 56 citizens were condemned to death, a considerable number banished, and the city heavily fined. But from this blow it has never been able to recover. Much of its commerce was removed to Dort, and afterwards to Antwerp, where many of its principal merchants also retired; and the improvements in navigation had rendered its convenience as an emporium for merchandise less necessary. Much as it has fallen, however, from its former grandeur, it still retains a traffic equal to any city in Flanders. Besides its easy communication with Antwerp, Louvain, Mechlin, and Brussels, it communicates also, by means of navigable canals, with Ghent, Sluys, Ostend, Nieupoort, Furnes, and Dunkirk, &c.; and this communication is extended by the rivers Schelds, Scarpe, and Lys, as far as Tournay, Lille, Menin, and Douay. Its port is at the extremity of the canal which leads to Ostend, and is capable of containing 100 merchant-vessels; and, from the sluices which are constructed on the IJze canal between Bruges and the sea, at Lecke and Plessendal, which are defended by forts, vessels of 400 tons can easily approach the very centre of the city.

Bruges has various manufactures of broad says, serges, baize, and other woollen stuffs; also damasks, camlets, and fine linens,—which last are equal to those of Holland, and are sold in a market held every week under the arcades of the Hotel de Ville. Its laces pass for those of Mechlin, and are sold at the same price. Besides its manufactures, Bruges exports a considerable quantity of corn, and all kinds of seeds proper for making oil, particularly colza. Its imports are nearly the same with the other cities of Flanders and Brabant.

It was at Bruges, in 1480, that Philip the Good, Duke of Burgundy, instituted the illustrious order of the Golden Fleece, upon his marriage with Elizabeth, princess of Portugal. The property belonging to this order was called the Franç de Bruges, and contained 37 villages, which enjoyed considerable immunities. The fortifications of this city are very indifferently, and have never been able to stand a long siege. It was several times taken and retaken during Queen Anne's war, and was at last surrendered to the allies, December 30th, 1709. The French troops entered it on the 24th of July 1794, when the magistrates signed a formal submission to the republic of France.

Bruges has a prefect, a secretary-general, a receiver-general, a payer of the public money, and a director of the customs. It has also a chamber and tribunal of commerce. Population 25,000. North latitude, 51° 11' 30''; east longitude, 4° 5'. See Peuchet Dictionsaire, &c.; and Tyenna Almanach du Commerce, 1811. (p.)

BRUGULIERA, a genus of plants of the class Dodecandria, and order Monogynia. See Botany, p. 296.

BRUN, CHARLES LE, was an artist of such eminence, as to add lustre to the age of Louis XIV. He was born in 1619; and, as his father (who was a sculptor by profession) was descended from a Scotch family, it is probable that the name was originally written Brown. He was not an exception from the general rule, that great excellence in any of the arts, is the result of great industry, co-operating with strong genius. As early as the age of four, Le Brun is said to have found a substitute for the pencil, in the same expedient which supplied young
Pascal with the means of describing his diagrams,—the use of coals taken from the hearth. His first production, which obtained particular admiration, was a portrait of his grandfather, taken when he was not more than twelve. Fortunately, his genius did not want all the encouragement and aid which it deserved: After having studied with great success in the school of Vouet, in his 23rd year he was sent by the Chancellor Seguier to Italy, where he pursued his art during six years, under the inspection and the roof of Poussin. Though his genius led him to great designs, yet he was so well aware of the advantage of correctness in the minutest things, that he made the manners and costume of antiquity a particular study during the period of his education, which was happily prolonged till his 30th year. He now returned to Paris, where he was soon distinguished by a court the most polished in Europe, and a monarch who added to his other ambition, the more honourable emulation of the character of the most munificent patron of the fine arts. He was introduced to the king by Mazarin, and found a powerful friend in Colbert, to whom he was indebted for his appointment as the king's first painter, as well as for letters of nobility. These honours were conferred upon him in 1662. To the same minister he owed his appointment to the general direction of all the royal works. He was afterwards placed at the head of the academy of painting, which he greatly served, by his successful exertions, to procure the establishment of a new school at Rome, in which young artists, selected from his countrymen, might be gratuitously educated. In his old age, however, Le Brun experienced mortifications arising from causes not necessarily implied in age. Colbert was removed from the superintendence of the royal edifices. Louvois succeeded to the department, and it was natural that the new superintendent's enmity to Colbert should embrace all his favourites. If the king was not to be influenced so far as to withdraw his countenance from Le Brun, yet it was easy to torment a man of his character, by giving him a rival at the palace, in the person of Mignard, and by pointing the competition with all the vexations of a little and contemptible malice. Le Brun was not of a temperament to regard these attempts upon his quiet with philosophical indifference, or with cool disdain. They shook his tranquillity, and are thought to have hastened his dissolution; he died of a decline in 1690, in the 71st year of his age. Extreme jealousy of competition seems indeed to have been the great shade in his character, unless the imputation may be thought to have arisen not so much from an excess of jealousy in him beyond other professors of his art, as from his more unreserved expression of what he felt. Had he judged it necessary or decorous to make a secret of his feeling of jealousy, he would doubtless have suppressed the expression of satisfaction, after his visit to another and a formidable rival, Le Sueur, in his last illness, on which occasion he was heard to say, that death was going to take a great thorn out of his foot. The discredited report that he had procured his rival's death, by poison, is a proof, both of the prevailing opinion of his jealousy, and of the scandalous illiberality of his enemies. The merit of Le Brun, as a painter, was such, that few have had less cause for apprehension from competition. His genius, and the course of his studies, engaged him in lofty designs, in the execution of which, the historical propriety, good ordonnance, and just expression, are particularly admired. As a colourist, he is entitled to less praise; and in drapery and ornament, by departing from simplicity, he has betrayed considerable deficiency of taste. As a writer, he is well known by his two works, one on physiognomy, and the other on the passions, the latter of which contained figures, which have been much used as models for drawing. It is mentioned, in proof of his solicitude to unite correctness of execution with grandeur of design, that his figures were all drawn naked, and afterwards clothed; and it is related of him, that when he was employed about his great work, the battles of Alexander, he obtained models of Persian horses, drawn for the purpose at Aleppo. The other most celebrated productions of his pencil are, St John in the isle of Patmos, the carrying of the cross, the crucifixion, and the penitent magdalen. He has gained less reputation by his paintings in the great gallery at Versailles, which occupied him during fifteen years of his life, and in which he has exhibited, in allegory, the great events of the reign of Louis XIV. In this work the artist was instructed and trammelled by the courtier; and, if to say, materiem superat opus, is but restricted praise, it is all that could be required, in a labour that was rather imposed by interest than chosen by the judgment. See D'IArgenville Vies des Peintres. (J. M.)

BRUNDISI, or BRUNDIUM. See BRINDISI.

BRUNELLA, a genus of plants of the class Dodecandria, and order Pentagonia. See BOTANY, p. 257.

BRUNFELSIA, a genus of plants of the class Didynamia, and orde: Angiosperma. See BOTANY, p. 240.

BRUNIA, a genus of plants of the class Pentandria, and order Monogynia. See BOTANY, p. 135.

BRUNN, BRNN, BRNN, BRNO, or BRUNA, is a city of Moravia, and the capital of a circle of the same name. This town is agreeably and strongly situated, at the confluence of the rivers Schwarzwach and Surtawa, upon two mountains, the sides of which are well cultivated, and covered with vines. The town is long, and well built, and is remarkable for the beauty of its churches and public edifices. The principal of these is the palace of Dietrichstein; the fine church of the Jesuits; the convent of St Thomas, where there is a miraculous Madonna, pretended to have been painted by the Evangelist Luke; and the castle of Spielberg, which is built on an eminence near the town, and forms its principal defence. This castle is used also as a state prison, and if it were not a little commanded by the higher ground, it would be one of the finest fortresses in Europe. At the foot of the fortress stands two cloisters of nuns, and an hospital of the Knights of Malta. The Carthusian monastery of Konigsfeld is very near the city; and half way between Brunn and Rischaw, there is a monument of marble erected in honour of one of the emperors. The bas reliefs in bronze, represent him as conducting the plough. There are
Brunswick, and order Trigynia. See Botany, p. 216.

BRUNONIA, a genus of plants of the class Pentandria, and order Monogynia. See Botany, p. 175, and Brown's Prodromus Plant. Nov. Holl. &c. p. 589.

BRUNSVIGLA, a genus of plants of the class Hexandria, and order Monogynia. See Botany, p. 193.

BRUNSWICK, a city of the kingdom of Westphalia, and capital of the department of the Ocker, is situated in a very agreeable plain on the banks of the Ocker, which is navigable above the city as far as Wolfenbulte. It was formerly an imperial city, and one of the richest and most powerful of the Hanse towns: It maintained its liberty during many severe and tedious contests, until 1671, when it was subjugated by Rodolphus Augustus, Duke of Brunswick Wolfenbulte, who erected a citadel in the town to secure its subjection; and, from that time, it continued to be the residence of the reigning prince, until its annexation to the kingdom of Westphalia. The town has the form of nearly a square. It is strongly fortified, and extends about two miles in circumference. On the ramparts is a brass mortar, 105 feet long, and above 3 feet in diameter. It weighs 1800 quintals, and requires 52 lb. of powder for a charge; and can throw a ball of 780 lbs. weight to the distance of 32,000 toises. The houses are in general old, and built of wood; but the city has lately received considerable additions, and is daily acquiring fresh beauty. The principal public buildings are, the duke's palace, which contains a superb collection of natural history, of prints and pictures, and in the library are a number of scarce and curious bibles, and fragments of bibles, in various languages, amounting to nearly 1000 volumes; the cathedral, which contains the tombs of Duke Henry the Lion, and of several emperors and princes of the house of Guelf; the churches of St Nicholas, St Catherine, and St Andrew; the academy for martial exercises, where the students are instructed in every branch of science connected with military tactics; the armoury; the council house; Caroline college, erected by Duke Charles in 1745; two gymnasia, with a school for anatomy and surgery; and a college for the study of physic, instituted in 1757. It has also an orphan house, a large lazaretto, and an hospital. After Brunswick ceased to be a free, and became a fortified city, its commerce began to decline, and its population to diminish. The interruptions of trade, occasioned by frequent wars, and the insolvency of its garrison, soon drove many of its tradesmen to settle in the other free cities of Germany. About the middle of the last century, however, this city was again plentifully replenished with French refugees, who had been driven from their country by popish intolerance, and sought in Brunswick the freedom of religious worship. These were greatly encouraged by the reigning Duke, who granted them considerable privileges and immunities; and, under their direction, were established many valuable manufactures of woollen cloths, such as serges, barracans, flannels, rutteens, and camlets. Besides these, Brunswick has manufactures of silk, linen, steel, iron, paper, snuff, earthen-ware, and varnish, also bleaching yards for linen, and extensive breweries. Its manufacture of printed calices is one of the most flourishing, and the first of the kind in Germany, and its preparations of red alum, and sal ammoniac, are of a very superior quality. Strong beer, called mun, from the name of the inventor, Christian Mummer, is exported to various parts of Europe, and even to India; and many tons of succory root, prepared as coffee, are annually sent to Lubeck, and thence exported to Sweden and Russia.

In this city, many hundreds are employed in spinning woolen flax, and the invention of spinning wheels is ascribed to a statuary of Brunswick, called Jurgen, in 1530. They are furnished with the materials from the work-house, which was established for the purpose of providing employment for the poor, and are paid for their labour on the same terms as those employed by the manufacturer. Grown up persons perform this work at their own homes; but 200 children are daily employed in the house, where they are also instructed in reading and writing. The commerce of Brunswick is now very considerable, both in natural and artificial productions, as well as in foreign merchandise. Its fairs are crowded with strangers, from all the principal cities of Germany, who bring from Hamburgh the manufactures of England, with calicoes, velvets, silk ribbons, tresses, and point work of gold and silver; from Bremen and Lubeck various kinds of tanned leather, tallow, oil, wine, and foreign merchandise; linens from Silesia; from Leipsick and Saxony the productions of Italy, Switzerland and France; and from Berlin, Nuremberg, Augsburg, &c. the manufactures of their respective cities, which they either sell or exchange for other commodities. There is always a great traffic here for yarn and flax; and immense quantities of green thread are exported every year to Holland, which is bleached at Haerlem. During the fair the duties are very moderate, and many foreign merchants compound for a certain sum, by which means they are not obliged to disclose the amount of their sales, which is otherwise the only method of determining the duty. The two great fairs continue 18 days each, and begin, the one on the Sunday after Candlemas, and the other on the Sunday after St Laurence-day. Population 31,700. N. Lat. 52° 25'. E. Long. 10° 46'. See Peuchet Dictionnaire, &c. and Tyina Almanach du Commerce, 1811. (p)
BRUNSWICK, New, one of the four British provinces in North America, is bounded on the south-east by the Bay of Fundi, on the south by New England, on the north and west by Canada, and on the east by the Gulf of St Lawrence. The principal towns of this province are Fredericstown the capital, St Ann's, St Andrew's, and St John's; and it is watered by the rivers St John's, Magogadavicke, or Eastern River, Dickwasset, St Croix, Merrimich, Petitcodiac, Memramcook; all of which, excepting the three last, discharge themselves into Passamaquoddy Bay. In the St John's River the tides flow about 80 miles; and it is navigable for vessels of 50 tons about 60 miles, and for boats about 200 miles. The vast extent of country into which it opens, contains rich vales and cultivated meadows, while the higher grounds are generally covered with wood.

After the settlement of this province by the American loyalists in 1783, the inhabitants eagerly engaged in endeavouring to supply, with fish and lumber, the British possessions in the West Indies; and within the first ten years, they had built 93 square rigged vessels, and 71 sloops and schooners, which were principally employed in that trade. In the year 1793, however, this trade was greatly injured by the permission granted by proclamation to the United States of America, to supply the West India islands with every thing they wanted. The citizens of the United States being exempt from a duty of 2½ to 5 per cent. exacted in the West India islands from British subjects, and not being subject to the high rates of insurance on their vessels and cargoes, nor to the great advance in the wages of seamen, with which the inhabitants of New Brunswick had to struggle, were obviously enabled to engross a great part of the trade of that province. The American government, by granting a bounty of nearly 20 shillings per ton on all vessels employed in the cod fishery, have now engrossed the principal part of the cod-fishery in the bay of Fundi; and from the county of Charlotte, which is separated only from the United States by a navigable river, have been enabled to carry off annually, and to reship for the American market nearly three millions of feet of boards, cut in that part of New Brunswick, and also a large proportion of the fish, caught and cured by British subjects, in the bay of Passamaquoddy.

The sea-coast of New Brunswick abounds with cod and scale fish, and immense shoals of herring, shad, and salmon annually enter its rivers. The herrings are possessed of a greater degree of firmness than the common herrings, and are capable of being kept longer in a warm climate. They are caught in such abundance, that the quantity cured is limited only by the insufficient number of hands employed. The numerous harbours along the coast are conveniently situated for the cod-fishery, which may be carried on to any extent. Near the margin of the numerous rivers, creeks, and lakes, which intersect the province, the country is for the most part covered with inexhaustible forests, of pine, spruce, birch, maple, elm, fir, and other timber, proper for masts of any size, lumber, and ship-building. The smaller risers afford excellent situations for saw-mills; and from the melting of the snow in spring, every stream is rendered sufficiently deep to float down the masts and lumber of every description, which the inhabitants have cut and brought to its banks during the long and severe winters, when their agricultural pursuits are suspended.

In the interior of the province, the lands are generally excellent; and where they have been cultivated, they have proved very productive, owing to the small number of the inhabitants. Great advances have not yet been made in agriculture; but within a few years preceding 1804, there has remained, beyond the domestic supply, a considerable surplus in horses, salted provisions, and butter for exportation. The following table exhibits the trade of New Brunswick during the last seven years:

BRUSSELS, or Bruxelles, a city of France, formerly the capital of Brabant, and of the Austrian Netherlands, now the chief place of the prefecture of the department of the Dyle, is situated on the river Senne, in a fertile and picturesque country, about 27 miles S. of Antwerp, with which it communicates by a canal, and 177 N. by E. of Paris. It is a rich, handsome, and populous city, rising from the river to an eminence on the east, and unites the magnificence of Paris with the clearness of a Dutch town. Brussels is encompassed by a double brick wall, with seven gates, and about seven miles in circumference; and without the walls contains seven parishes, Ste. Gudule, Notre Dame de la Chapelle, St Geri, St Nicholas, Ste. Catherine, St Jacques de Cauverge, and Notre Dame de Finis-terre. It is surrounded with extensive suburbs, consisting of several villages, and joined to the city by a continuity of streets and buildings. The city is divided into eight sections. The older and lower streets are small and crooked, but the more modern ones are straight and wide. The houses are lofty and well built, and its public structures display both taste and magnificence. The ducal palace, where the governor used to reside, stands upon an eminence, with a large square before it, encircled with pillars of brass, on which are statues of several emperors and dukes of Brabant, as large as life. It was begun in 1300, by John II, duke of Brabant, and finished by the successors of Philip the Good in 1521. It then contained one of the most beautiful chapels in Europe, which was pulled down in 1777, to make room for the new square called Place Royale. This superb building is now converted into a central school for the department of the Dyle, to which is attached a public library, a botanical garden, and a collection of paintings. The school is divided into three classes. In the first are taught, drawing, natural history, and the Greek and Roman classics; in the second, ma-
Brussels.

thematics, physics, and chemistry; and in the third, universal grammar, the fine arts, history, and jurisprudence. The library was collected from the Belgic emigrants, and the libraries of the suppressed cloisters. It contains about 120,000 volumes, and some valuable MSS. Behind the palace, at the extremity of an extensive and beautiful park, well stocked with deer, stood a pleasure-house, built by order of Charles V., and where he resided six months previous to his abdicating the imperial throne. This fine park was nearly destroyed by the French soldiery and the Belgic sans-culottes, and would have been totally laid waste, had not the French general interposed, and prevented its total destruction. It has, however, been restored to its former beauty by the municipality of Brussels, at their own expense. In the great market-place, which is the most beautiful in the world, is the Hotel de Ville, begun in 1380, and finished in 1442. The building is Gothic, and has a most magnificent appearance. Its turret is an admirable piece of Gothic architecture, 364 feet in height, and surmounted by a statue of St Michael with the dragon, in copper gilt, 17 feet high. This statue turns upon a pivot, and acts as a vane. In one of the apartments of the Hotel de Ville were formerly held the meetings of the states of Brabant. It is handsomely ornamented; and in three other rooms is the history of the resignation of Charles V., so beautifully wrought in tapestry, that it may be mistaken for painting. This edifice is now appropriated to different tribunals, and one of the wings is converted into a prison. The church of St. Gudule is a very magnificent structure, situated in a high part of the city, and approached by a flight of steps. It contains no less than sixteen chapels, all of which are decorated with some very capital paintings. The chapel of Notre Dame is also a beautiful old building; and the church of the capuchins is the finest which that order possesses in Europe. But since the last conquest of Belgium, nearly one third of the churches have been shut up, and despoiled of their plate and pictures. Besides these, there are many palaces belonging to the nobility, in which are some of the most valuable paintings, by the best Flemish masters. Brussels has also 20 public fountains, embellished with statues, one of which is a child in brass, so admirably executed, that it has excited the notice of the first connoisseurs. The hospitals are well endowed, among which is a foundling hospital, and one for penitent courtesans; and also an hospital where strangers were maintained free of expense for three days. Brussels had once an imperial and royal academy of sciences and belles lettres, which was instituted by letters patent, the 16th of December 1772, and whose memoirs from 1777 to 1788, are published in 5 vols 4to; but, "like all other antient institutions," says a French writer, this society exists no longer.

The manufactures of this city have always held a distinguished place in the trade of Europe. Its laces and carpets have seldom been equalled, and never surpassed; and though of late years, many of its workmen have been dragged from their homes, to supply the waste of the French armies, yet these manufactures are still carried on to a considerable extent. All kinds of cotton and woollen stuffs are made here. Its camlets are superior, both in beauty and quality, to those of Leyden and England; and its silk stockings equal in fineness those of Paris, and, as they use only the silk of Piedmont, are far superior in quality. They manufacture also gold and silver lace, which can scarcely be distinguished from the finest of Lyons and Paris. Great quantities of this article are sent to India, and to every part of Europe; and the Brussels merchants have greatly the advantage over their competitors, since labour is here much cheaper, and since they are allowed, as an encouragement to industry, to export it free of duty. The considerable drawback, however, upon this manufacture is, that they must bring all their gold and silver ware from Paris, Amsterdam, and Lyons. It is, besides, several manufactories of potash; and its earthen ware is said to be even preferable to that of Delft or Rouen. But though Brussels may still surpass many of the cities of Europe in the beauty and quality of some of its manufactures, yet it has greatly fallen from its former eminence as a commercial city, and retains very little of that activity which characterised it while under the dominion of the Dukes of Brabant and the house of Austria. Its fair, which is held annually on the 8th of October, has now lost its most regular and wealthy visitors, the merchants of England; and the blockade of the Schelt, greatly hinders its communication with the eastern and western continents.

In 1521, the citizens of Brussels were divided into nine classes, called nations, who were formed of the principal artisans of the city. They are distinguished by the names of Notre Dame, St Gies, St Laurent, St Geri, St Jean, St Christophe, St Jaques, St Pierre, and St Nicholas, each nation having a chief or dean, with his assistant council. They were assembled by a bell, called the bell of the nations, to signify their consent, in the name of the city, to any subsidy demanded by the sovereign, or to any proposition of the burgomaster.

Besides the governor-general and council, the magistracy of Brussels formerly consisted of an amman, a burgomaster, seven echevins, two treasurers, a pensionary, three secretaries, three gressiers, and two receivers. These were elected by the governor from the descendants of seven patrician families, who according to Puteanus, a famous historian of the country, were anciently the lords of Brussels, viz. the families of Steenweghe, Skeews, Shreygh, Coudenberg, Serrelof, Sweerts, and Rodenbeck. It had also a deputy amman, an under burgomaster, nine counsellors chosen from the citizens, a superintendent of the canal, a receiver for the canal, and a gressier of the treasury. The second burgomaster, the counsellors, and the receivers, were named by the first burgomasters; and the offices of ammans, secretaries, and gressiers of the treasury, were perpetual. All matters relative to the citizens were cognizable before the magistracy, with the right of appeal to the superior council. Since its annexation to France, however, this form of government has been abolished. It has now a prefect, a secretary-general, a receiver general, a payer of the public treasure, and a director of the customs. It is the imperial court for the departments of Jemappes, the
Two Nethes, the Dyle, the Scheldt, and the Lys. It has also a court of criminal and special justice, with a chamber and tribunal of commerce.

The city of Brussels owes its origin to St Gery, bishop of Cambrai, who, in the beginning of the 7th century, built a chapel in a small island, formed by two branches of the Senne, and preached the gospel to the neighbouring peasants. Attracted by the pleasantness of the situation, and the piety of the venerable bishop, the peasants flocked from the surrounding country, and numerous huts soon arose along the banks of the river. These, in a short time, increased to a considerable village, to which they gave the name of Brussels, hermitage-bridge, and so early as the year 906, it had both a market and a castle. In 1044, it was first enclosed with a wall, and fortified with towers, of which some vestiges are still remaining; and, in 1379, it was greatly enlarged and walled round, in the manner in which it now appears. It became the residence of the Dukes of Brabant, and afterwards of the Austrian governors, who kept their court here with all the honours of a sovereign prince; and during the usurpation of Cromwell, this city was also the occasional residence of Charles II. of England, and his brother the Duke of York.

In 1695, it was bombarded by Marshal Villeroi, who advanced towards Brussels in hopes of compelling the allies to raise the siege of Namur, and poured in such a quantity of bombs and red-hot balls, that the city took fire, in which 4000 houses, and 14 beautiful churches, were consumed. After the battle of Ramillies, it was abandoned by the friends of Philip V. and the keys of the city were presented to the Duke of Marlborough, who took possession of it in the name of Charles III. King of Spain. It was again besieged in 1708, by Maximilian Emmanuel, Elector of Bavaria, who, after having been repulsed, was compelled to retire by the approach of the Duke of Marlborough. Marshal Saxe took Brussels in 1746, but it was restored at the peace of Aix-la-Chapelle, and continued under the Austrian government until the revolutionary war, when Dumourier entered it on the 14th of November 1792, soon after the battle of Jemappes. He, however, quitted it to the Austrians on the 23d of March in the following year, and left no traces of his hostile visit, except the universal defacing of the imperial ensigns. The French regained complete possession in the summer of 1794, and at the peace it was annexed to France. Population, 75,000; or, according to Tinsen's Statistical View of France, 66,279. E. Long. 4° 26', N. Lat. 50° 51'. See Bygge's Travels in the French Republic, p. 51; Trotter's Memoirs of Mr Fox, p. 110, 153; Shaw's Sketches of the History of the Netherlands; Holcroft's Travels from Hamburgh to Paris; Peuchet Dictionnaire, &c.; and Tynan Almanach du Commerce, 1811.

(p)

BRUTE is the name given, in common language, to all those classes of living creatures which are conceived to be destitute of reason, and particularly the beasts of the field. It is evidently derived from the Greek βρύο (whence βρυνα), to feed, which may be traced to the Hebrew זר, or to דב, (whence דב, food,) these animals having always been noted for their voracious tendency, prona et ventri obedientia.

In treating the article ANIMAL, we shortly adverted to the speculations of philosophers concerning the disputed boundaries between the imperfect modification of life peculiar to vegetables, and the higher principle of animation inherent in sensitive beings. The object of the following remarks is, by comparing the chief resemblances and diversities observable among the rational and irrational tribes, to ascertain the characteristic features of distinction which mark the degradation of the brutish below the intelligent nature.

On this point, two leading opinions have been maintained,—the one, that the capacities of brutes differ from those of man in degree only; the other, that they differ not merely in degree, but also in kind.

In some particulars, the faculties of the lower animals appear to be at least equal to the human. Many of them give proofs of the most acute sensibility in their perceptive organs, while, at the same time, they possess abilities for active exertion, which set the strength and patience of man at defiance. But these advantages can be claimed by a very limited proportion of the less perfect animals; and upon the whole, the pre-eminence of our race is such as scarcely to admit of a comparison with the other inhabitants of this globe.

Even this inconsiderable superiority of certain animals, in respect of hardiness, agility, muscular power, and organic acuteness, is much less discernible when we view man in that condition which is the least removed from that of brutes. The savage pursues a mode of life, which, though it exposes him to unceasing peril, brings all his corporeal powers into action; and, however little he may be indebted to the co-operation of his fellows, or to the adventitious benefits resulting from civilised life, he is able, under the most unfavourable combinations of circumstances, to assert his supremacy over all the families of birds and beasts which people his native woods, not only in consequence of the ascendancy of his reason, but even in the application of dexterity, force, and cunning; the only weapons which his winged and quadruped rivals are capable of wielding.

The brutes appear to be guided almost entirely by appetite and instinct. The gratification of their senses, if not the primary law of their existence, is at least the object which seems perpetually to occupy them. When they are left to themselves, this desire of sensitive indulgence rarely proceeds beyond the bounds which are consistent with the preservation of the individual, or the propagation of the species.—And whenever these ends are promoted by means which are not evidently subservient to enjoyment, or which presuppose an intuitive sagacity not referable either to sense or to reason, we ascribe the result to instinct. It is possible, however, and, indeed, it is highly probable, that in most, if not in all, the cases of what we denominate instinct, the animal is incited by sensation, or appetitive orgasm, as much as when we can discern the impulse by which it is actuated. And there seems to be great reason to suspect, not only that the senses of some animals are finer than
ours, but even that they possess additional senses, enabling them to discover certain qualities of alimentary substances, and certain changes in the state of the atmosphere, which are not discernible by human organs. But though, in a state of nature, all the actions of brute animals may, in general, be referred to instinctive impulse and sensual desire, they are evidently capable of profiting by experience, and of being moulded by tuition, so as to exercise powers which they never acquire in any degree of proficiency, till they become the subjects of instruction. Whether we consider them as learning by their own observation, or as being trained by discipline, we must allow that they are possessed of certain faculties analogous to those powers which render man susceptible of education. They could not be taught any of those feats which are sometimes exhibited, unless they retained in the memory the impressions made on their senses, and unless they were actuated by motives to exercise volition, or to submit to authority. Immemorable instances might be produced, of the tenacity with which they preserve trains of ideas, and of the facility and accuracy with which they can retrace a series of objects, even in an inverted order, as when a dog or a horse returns by a way along which he has passed only once, and at a distance of time which precedes the supposition of his being guided by the smell. A horse will, at the distance of many years, remember the precise spot where he has been frightened, though no vestige of the terrific object should remain. We have no certain means of determining how far Aristotle’s assertion is correct, that brutes are destitute of the power of reminiscence, or the voluntary effort to recover what has escaped the recollection. Dr Reid’s opinion, that they cannot measure time as men do, by days, months, or years, and that they have no distinct knowledge of the interval between things which they remember, must be received with some limitation. In some pastoral districts of this country, where the dogs are accustomed to follow their owners to church, it is a well attested fact, that some dogs have formed the habit of going every Sunday, even when divine service was not performed, and when, from the uniformity of the occupations going on in such scenes every day of the week, it is difficult to perceive what particular association could have influenced them, unless they had acquired the capacity of numbering the days of the week. But if brutes do possess this faculty, it is probably in a very imperfect degree; and we would require stronger testimony than that of Montaigne, to induce us to credit the story of the arithmetical oxen at Susa, every one of which, being in the daily practice of turning an hundred rounds of a wheel for drawing water, was so accustomed to this number, that no force could prevail on him to proceed beyond it. The thing will not, however, appear altogether inconceivable to those who have had opportunities of perceiving how well the most unwieldy animals, such as elephants, camels, and bears, may be taught to dance, and how many notes of a tune some birds can learn in a very short time;—facts which render it probable, that these creatures may, to a certain extent, form measures of duration, and acquire the ideas of number.

It is commonly supposed that brutes are void of imagination. How then are we to account for those appearances during their sleep which seem to indicate dreaming?

Quippe videbit eique fortas, cum membra jacentur
In somnis, ovulatur tenerum, spirareque saepius.
Venantumque canes in moli sape quiete
Jactant crura; tamen subito, vocesque repente
Mittunt, et cebros redicunt maribus auras.
Ut vestigia si teneant inventa ferarum, &c.

LUCR. I. fr.

The dreams of these animals, however, may be of such a kind, as not necessarily to imply the exercise of imagination; and probably they may be excited by some of the simpler processes of the association of ideas. They at least presuppose a faculty of conception.

Whether any of the inferior tribes of animals are capable of reasoning or not, has long been a subject of dispute. Most of the ancients admitted that the brutes possess this power; and it has sometimes been said, that the most familiar facts with regard to their docility, are specimens of ratiocination, or of deducing conclusions from the comparison of different ideas. When, for instance, a dog is taught to dance or tumble, he must be allured to obedience, and chastised for inattention. His choice, therefore, is supposed to be determined by such considerations as these: “If I obey, I shall be caressed and fed; if I disobey, I shall be beaten and starved. It is, therefore, better for me to obey.” It is a simpler and more satisfactory account of this matter, to say, that obedience is associated with an idea of pleasure, and that neglect, or disobedience, is inseparably combined with the idea of pain; or, in other words, that hope and fear unite their influence with such force as to supersede the necessity of logical deduction. But there is certainly a degree of reason displayed by some of the more sagacious brutes, in pursuing a series of means, with a view to attain some desirable end, and in varying the means employed, according to circumstances. None of them, however, give any unambiguous proofs of a capacity to investigate truth by a procedure similar to the reasoning, or induction, by which the human mind proceeds forward to discovery. Mr Locke ascribes this defect to their inability of “abstracting or making general ideas.” They can reason only in particular ideas, (according to his opinion,) and they have no use of any general signs for expressing universal ideas; nor is this owing to the inaptitude of their organs for framing articulate sounds. Many of them can be taught to utter such sounds, but never to apply words with intelligence; and in this incapacity of generalising and of communicating their thoughts by artificial signs, Mr Locke conceives the specific discrimination between them and the human race to consist.

Whatever disadvantages appear to be involved in the want or imperfection of the rational nature, are abundantly compensated by the substitution of in-
We are far from subscribing to this fanciful opinion, which ascribes the origin of the arts to the imitation of blind instincts; but we must admit, that mankind, in the ruder states of society, have in general attended with great respect to the operations of the brute creation, and have imagined that they were indebted to them for many essential advantages. It appears to have been from a conviction of the superior sagacity of some of these creatures, that the art of augury took its rise; and many of the examples of brutal intelligence recorded by Cicero, in his 2d Book De Nat. Deorum, &c., appeared to have been noted chiefly as arguments for the practice of divination. Hence, too, as was remarked by one of the ancients, "Bullae a Barbaris propter beneficium consccrata." Hence the absurdities of the Egyptian superstition, in defying bulls and cats, crocodiles and serpents:

We may remark, farther, concerning the instincts of the inferior animals, that one of the leading distinctions between man and them, consists in his capacity of learning lessons, not only from the experience of his own species, but from attending to the economy of other tribes; whereas these creatures appear to gain no advantages from their observation of the labours of man, or from considering the ways of any other creature.

It would appear, also, that though the generality of animals are capable of being taught several things in addition to those which instinct prompts them to perform, none of them ever improves upon the native instincts peculiar to the species; and whatever diversity of ability they may exhibit in other respects, none of them is more accomplished than the rest, in the practices which Nature has taught his race. It is manifest, likewise, that the proficiency which any individual of a species may have attained by instruction is of no avail to his posterity. He has no means of recording his experience, or of transmitting any of his acquisitions to future generations. The only signs which he knows how to apply, are such as express emotions universally intelligible, and being incapable of forming and interpreting arbitrary signs, he can convey no ideas except those which are already familiar to his associates.

From these premises, it is not to be concluded, as Des Cartes and Malebranche have done, that brutes are neither more nor less than machines, qui mangent sans plaisir, crent sans douleur, ne desirent rien, et ne crargent rien. Nor, on the other hand, can we admit the doctrine of Helvetius, that the superiority of man must be referred entirely to corporeal organisation, and to the operation of certain adventitious circumstances in his outward condition. Both these opinions have a tendency to degrade the human nature; for if, on the former supposition, the actions of brutes are explicable by principles of mere mechanism, it will not be easy to shew, that human beings are not also machines, seeing we must ascribe similar effects to similar causes; and if the whole difference between the mental faculties of man and the capacities of beasts, be the result of peculiarities in organic structure, and accidental advantages, here, too, we are reduced to the necessity of adopting a system of materialism. Both these doctrines, indeed, are purely hypothetical, and unsupported even by the evidence of probability. We may grant, however, that the conformation of the human body is peculiarly adapted for the exertions of intelligence and will, and in particular, that the distributions of the nerves and muscles of the hand, the eye, the ear, and the vocal organs, confer advantages on man, which raise him greatly above the rank of the other animals. It must also be allowed, that some accidental discoveries have contributed greatly to advance the arts, and to confirm the supremacy of man;—and among the physical advantages to which he is indebted, it is not the least conspicuous, that, from his power of subsisting on various kinds of food, and sustaining the extremes of heat and cold, he can accommodate himself to every climate on the face of the earth. But these circumstances are not, of themselves, sufficient to establish his claim to superiority, or to qualify him for the dignified place which he occupies in the scale of existence. He is informed by a nobler spirit, "which teacheth him more than the beasts of the earth, and maketh him wiser than the fowls of heaven."
us of the operations of intelligence, and the labours
of ingenuity. It might perhaps be thought that
they approach nearer to man in affection than in un-
derstanding; but the symptoms of their attachment
to one another are generally of a very different char-
acter from the indications of human kindness. The
breed of the dam for her brood operates only so
long as they require her assistance and protection,—
and from the moment when they become indepen-
dent, we see the creature which fostered her young
so tenderly, and sheltered them so vigilantly under
the covert of her wings, "hardening herself against
them as though they were not hers." How differ-
ent from that maternal fondness in the human species,
which no lapse of time can ever detach from those
who were once caressed as babes and sucklings! The
most permanent attachments of other animals appear
to be those which are acquired. Some of them are
highly susceptible of gratitude; and we would not
easily give credit to an account of a dog deserting
a master by whom he had been affectionately treated,
however great the extremity of danger by which he
might be threatened. A sense of shame, and a spi-
rit of emulation, are likewise deeply rooted in some
of them; and that they are subject to jealousy, has
been affirmed by many authors. "Animalia (says
Lud. Vives) quaedam zelotypia tanguntur, ut olores,
columca, galli, tauri, ob nutum commonius." Every
one who attends to the domestic animals must have
observed proofs of resentment and envy when
there is any appearance of too liberal a share of par-
tiality being bestowed on a new favourite. With
the exception of beasts of prey in their natural state,
all animals are eminently social; and some of them
are capable of combining in great bodies for the ac-
complishment of ends which could not be attained in
a state of separation. The beaver and the bee are
the most remarkable instances of such a union; but,
in addition to these instinctive associations, we ob-
serve attachments taking place occasionally among
creatures of very dissimilar characters and habits.
There appears, however, to be no evidence that brutes
are actuated by any moral impressions, or that they
can discern between what is good and evil in con-
duct. They may be incited by hope, or deterred by
the apprehension of punishment—they may be de-
pressed by disappointment and sorrow, or elevated by
gladness, as in the case of recognizing an ac-
quaintance after a considerable period of absence.
They express these feelings by sounds which are in-
telligible, but only to their own species; and they
seem to understand the various notes of sadness,
threatening, displeasure, commiseration, and endear-
ment, uttered by man and by other creatures. They
seem frequently to be moved with sympathy; and
though there is perhaps more fancy than nature in
Virgil's description, it is certain that some animals
are capable of mourning the death of men:

Post bellator opus, positis insignibus, Æthin;
It lauremns, guttisque humectat grandibus.

\[\text{En. xi.}\]

Upon the whole, however, we may conclude, that
the difference between the human and the brutal con-
stitution, is a difference of kind as well as of de-
De Animal. &c. (x)

BRUTON, or BRIGHTON, the name of a mar-
ket town in the county of Somerset, situated near
the head of the river Brew, over which there is a
stone bridge. The town is pleasantly situated and
well built. It consists chiefly of three streets, in
the centre of which is the market-place. In the
high-street is the market-house, which was built by
a subscription of the farmers who frequented the
town. Over the market-house is a spacious hall, in
which the quarter sessions for the eastern division
of the county are sometimes held. The church is a
handsome building, and has two quadrangular towers,
one at the north, and the other at the west aisle.
There is also a free school at Bruton, founded by
Edward IV., and a noble almshouse, endowed by
Hugh Saxey, Esq. auditor to Queen Elizabeth.
Its annual income is about L.2500. The old hex-
agonal market-cross, which was lately removed, was
supported by six pillars at the angles, and a large
one in the centre. It was 18 feet high, and was built
by John Ely, the last abbot of Bruton. The only
manufactures of the town are, a small one of stock-
ings and inferior kinds of woollen goods, and an-
other of silk throwing; which is performed by ma-
cinery. Number of houses 333. Population in 1801,
1631, of whom 180 were returned as employed in
trade and manufactures. See Maton's Tour through
the Western Counties, vol. ii.; and Collinson's His-
try of Somersetshire, vol. i. (x)

BRUTUS, LUCIUS JUNIUS, was a son of Marcus
Junius and Tarquinia, daughter of Tarquin the
Proud. His name was held in great veneration by
the Romans, who regarded him as the author of their
liberties, and founder of the Roman republic; and,
as commonly happens, this veneration, sided by anti-
quity, has caused too much of the marvellous to be
admitted into his history. Livy informs us, that
Brutus, having seen the chiefs of the city, and among
them his brother, cut off by the tyrant, resolved to
save himself if possible from the jealousy of Tarquin,
by allowing his property to be alienated without op-
position, and by assuming such a character of stupi-
dity, and even futility, as gained him the name of
Brutus among his countrymen. Notwithstanding
when Tarquin, alarmed at the portent of a serpent
in the palace, resolved to send confidential messengers
to consult the oracle at Delphos, Brutus was chosen
to accompany two of his sons on an errand which
was held of the greatest import, and in a voyage
which must have appeared at that time long and cri-
tical. It is added, that Brutus, in allusion to his dis-
 guise of his true character, made an offer to Apollo
of a staff of gold incrusted in a wooden tube; and
that when in reply to the enquiry of the Tarquins,
"which of them should reign in Rome?" a voice
issued from the cave, which declared, "that he should
have the supreme authority at Rome who should first
salute his mother with a kiss." Brutus, in order to
determine the accomplishment of the oracle upon
himself, fell to the earth as if by accident, and salu-
st that with a kiss. On their return to Rome, they found the king engaged in preparations for making war upon the Rutuli. During the siege of their principal town, Ardea, it happened, that the sons of Tarquin, and others of the royal house, being entertained at the quarters of Sextus Tarquinius, which disputed a question which implied little of modern refinement, each maintaining the superior excellency of his own wife. At length it was agreed that the whole party should mount their horses, and surprise the ladies as they might happen to be employed at the time. The result of the trial was, that Lucretia, the wife of Collatius, was declared to be the most deserving; and, that Sextus Tarquinius, whose passions were inflamed by the virtue which should have awed them, resolved that Lucretia should be their victim. Having, after a short interval, accomplished his villainous design, he left the insulted matron to her shame and her revenge. Having convoked her principal male relations and friends, she first acquainted them with her dishonour, and its author, and then plunged a dagger in her heart. That Brutus should have been present on such an occasion is not easily reconciled with his reputed fatuity, unless his friends might be supposed to be in a secret which yet remained a secret to the rest of the royal family, and to all Rome. Now, however, as if moved by inspiration, he threw off his disguise, and, in an animated strain of eloquence, engaged all who were present to bind themselves with him in a solemn oath to pursue the atrocious offender, and all the family with fire and sword, and to abolish the regal name in Rome. The body of Lucretia being then removed into the Forum of Constantia, (the town where Collatius resided,) Brutus reproved the lamentations of the friends of the deceased, and called upon the inhabitants to shew themselves men, and Romans, and take arms against the authors of the crime. The youth of the place soon crowded around him in arms. A garrison was appointed to defend the walls, and guard the gates, that none might pass out of them, and carry tidings of what was going on to Tarquin. From Constantia, Brutus, accompanied with a body of men, repaired to Rome, and in an oration of great pathos and force, called upon the people to punish the offenders, and expel the tyrant. The laborious and degrading employments in which Tarquin had long employed many of the citizens, treating them more like slaves than soldiers, furnished him also with a popular and persuasive topic of declamation. Intelligence of these commotions soon reached the camp before Ardea, and summoned Tarquin to Rome. Brutus foreseeing such a step, and prepared to turn it to the advantage of his enterprise, marched from Rome to Ardea by a different route, and arrived in the camp at about the same time that Tarquin appeared before the walls of Rome. The gates of the city were closed against him; and the army before Ardea were, in like manner, engaged to drive his sons out of the camp. Two of them followed their father into Etruria; but Sextus, the perpetrator of the outrage, having repaired to his province, was slain there by the Gabii, who hated him for his former rape and murders committed among them. The Comitia of Centuries were now assembled at Rome, and two consuls elected, Lucius Junius Brutus, and Lucius Tarquinius Collatinus, 244 years after the founding of the city. One of the first acts of Brutus, according to Livy, was, to engage his colleague, Collatinus, to resign the consulship, and go into voluntary banishment, for which counsel no other reason was alleged, than that he was a Tarquin, and that the people would never think their liberty secure while any one of his family and name was invested with high authority. The advice of Brutus, seconded by Lucretius, Lucretia’s father, and enforced by the voice of the principal men of the state, and of the Roman people, had all the force of a command from a power that was not to be resisted, and Collatinus retired to Lavinium. Still, however, there remained in Rome a royal faction, consisting principally of young men who had been the associates of the exiled princes, and whom the manners of a licentious court had ill prepared for submission to the rigorous administration of republican laws. In the number of the disaffected were included the two sons of Brutus; Titus, and Tiberius, whose mother was the sister of the Vitellii, principal partizans of royalty. The conspiracy having been detected, it was necessary that the offenders should suffer the punishment of traitors, and the nature of his office imposed upon Brutus, the duty of seeing the sentence carried into effect. In the presence of the consuls, and of the whole city, the conspirators were first scourged, and then beheaded by the axe of the licensors. The father was sunk in the patriot, and the repressions of nature were not heard in favour of malefactors, who, for the gratification of disorderly passions, would have deliberately sacrificed their father and their country to the fury of an enraged and sanguinary tyrant. Brutus, whose stern and inflexible virtue was beheld with admiration, even by primitive Romans, did not long survive the expulsion of the tyrant. He fell in the battle which was fought on the first invasion of the Tarquins, by the hand of Aruns, one of the king’s sons, who fell at the same time beneath the stroke of Brutus. The matrons of Rome honoured the avenger of their honour with a mourning of one entire year. See T. Livii, Historiarum, &c.; Dionysii His- tioe nass. et Plutarchi Opera. (J. M.)

BRUTUS, MARCUS JUNIUS. It was believed by many that Julius Caesar was the father of Brutus, and Caesar seems to have been of the same opinion. It is certain that he was criminally connected with Servilia, the sister of Cato, and mother of Brutus, about the time of his birth. His father, whether real or nominal, was put to death by Pompey, for his rigorous treatment of the city of Mutina. Marcus was educated, in all the learning and philosophy of the times, and applied himself to the study of eloquence with such success, that Cicero has given him a place in his list of noble orators. When the conflicting parties of Pompey and Caesar made the ultimate appeal to arms, Brutus espoused the cause of Pompey with his characteristic decision, not from partiality to the man, whom till that time he refused to salute in passing, but thinking his designs less dangerous to the integrity of the republic than those of his rival. When he arrived in Macedonia, and entered the camp of Pompey, he was received by that
powerful leader with expressions of respect bordering on deference. After the decisive battle of Pharsalia, he escaped from the camp of the conquered, and concealed himself among the reeds in a contiguous marsh, from which, on the return of night, he fled to Larissa. At this place he received a friendly invitation from Cæsar, who received him with open arms. He was appointed by the conqueror to the government of Gallia Cisalpina, of which trust he shewed himself worthy. He promoted the happiness of the people, and taught them to respect Cæsar as the author of their good fortunes. This, indeed, appears to have been, if not the most splendid, yet the most beneficial part of his public life. Soon after, the first praetorship of the city was conferred upon him by Cæsar; in which act he consulted his inclination, and disobeyed his judgment. Cassius, he said, has the better title to it; notwithstanding Brutus must have the first praetorship. Cæsar was, indeed, so much his friend, that he constantly refused to suspect him of any designs against his government and person. To those who warned him to beware of Brutus, he replied, laying his hand upon his breast, "Do not you think, then, that Brutus will wait till I have done with this poor body?" If this fact, which is recorded by Plutarch, may be admitted, Cæsar was not well acquainted with the character of Brutus. Principle, and not ambition, appears to have been the spring of all his actions. All Rome confessed, that he, and perhaps he alone, of all the conspirators, was actuated by the purest motives,—by hatred, not of the tyrant, but of tyranny. Servility, whoever practised it, and tyranny, in whatever hands, were regarded by him with contempt and indignation. When Cicero was making assiduous court to Octavius, Brutus, in a letter to Atticus, expressed such an opinion of him as he seemed to merit; it was plain, he said, that he took his measures, not for the liberty of his country, but only to obtain a gentle master; and, in a letter to Cicero himself, he accused him of having reared a greater and more inutterable tyranny than that which they had destroyed.

Cassius was offended at the appointment of Brutus to the first praetorship, and he only became reconciled to the latter that he might engage him to destroy Cæsar. It was, indeed, one of the greatest consequence to the conspirators that he should be enlisted in the number. His integrity and patriotism were unimpeached and undoubted; and not less respected by the Romans than Cato, he was much more beloved. Having entered into that fatal coalition, his abstraction, when wakening, and his uneasy slumber, shewed that the power of philosophy has a limit, and alarmed the fears of Portia his wife, and daughter of Cato. Her pride was also offended, that he had not imparted his secret, whatever it was, to her; and, to convince him of her power to preserve it; even under torture, she voluntarily penetrated her thigh with a small knife. Afterwards, however, it was plain, that, with whatever fortitude she might indure corporal pain, she could not sustain strong mental conflict with the aspect of tranquillity. On the morning of the assassination, the conspirators were employed in deciding causes with accustomed coolness, waiting the appearance of Cæsar; and, when an appeal was made by some person from the judgment of Brutus to Cæsar, Brutus, looking round on the assembly, said, Cæsar neither does nor shall hinder me from acting conformably to the laws. In the mean time, Portia, who was in her house at Rome, was agitated with such solicitude and terror, that, after many fruitless enquiries and repeated messages to discover what Brutus was doing in the Forum, she sunk down in a delirium in the midst of her attendants, and occasioned a rumour in the city, which soon reached the ears of Brutus, that Portia was dead. Almost at the same moment it was announced that Cæsar was approaching in a litter; and Brutus was too much the Roman to be diverted, by any consideration, from what he deemed his duty to his country.

Plutarch informs us, that when Cæsar saw the dagger of Brutus pointed against him, he covered his head with his robe, and resigned himself to the swords of his murderers; and that Brutus, in attempting to have his share in the sacrifice, received a wound in the hand from one of the weapons. The sequel proved, how greatly Brutus erred in advising, contrary to the opinion of his companions, that Antony should be spared. His great popularity, both in the city and army, added to his military talents, consular authority, and unprincipled ambition, rendered him scarcely less formidable in a free state than Cæsar himself. Brutus, confiding too much in conscious integrity, erred again in conceding to Antony that Cæsar's will should be read publicly, and that he should have the direction of Cæsar's funeral. The use which he made of the opportunity thus put into his hands, of exciting the multitude, was such, that Brutus and his party thought it prudent to retire from Rome to Antium. Cicero, who was in the interest of the senate, remained in the city, and opposed the whole weight of his authority and eloquence to the usurpation of Antony. Brutus also, courting popular favour, after the manner of the times, caused magnificent shows to be exhibited in Rome in his name, but in his absence.

The arrival of Octavius Cæsar at Rome, and the adroitness with which he appeared to manage Cicero, and win him to his interest, convinced Brutus that Italy afforded no means of serving the cause of freedom. At the maritime town of Elea he took leave of Portia, whose Roman fortitude was again subdued by the sight of a picture, which described the parting of Hecat and Andromache. Brutus sailed for Greece, where he began his preparations for the impending war.

A new triumvirate was now formed in Italy,—Cæsar, Antony, and Lepidus, having agreed to divide the empire betwixt them. To meet the rising storm, it was necessary that the two republican leaders, Brutus and Cassius, should unite. Smyrna was the place of their first interview; on which occasion, Brutus, knowing that Cassius had collected a vast treasure, by such means as are usual in war, but which himself, either from humanity, or the love of popularity, had refused to employ, desired Cassius to furnish him with the sinews of war, by dividing his treasure with him. The friends of Cassius remonstrated, but
he at length consented, that Brutus should take for his use the third part of what he had. Their next interview was at Sardis, where mutual dissatisfaction produced angry altercation, which was, however, amicably terminated. Cassius, being more of a practical man than Brutus, connived at offices which it was not safe to punish, and was less scrupulous of the means by which grand purposes were to be accomplished. Brutus did not refuse to profit by the exactions of Cassius; but, at the same time, insisted, that the mal practices of their partizans should not be suffered to pass with impunity. When the combined army was about to leave Asia, and pass over into Greece, to oppose the forces of the triumvirs, Brutus, sitting alone in his tent by a dim light, and at a late hour, the whole army sleeping around him, was surprised by the sudden appearance of a tremendous spectre at his side. He demanded, What art thou? God or man? and what is thy business with me? To which the phantom replied, I am thy evil genius, Brutus; thou shalt see me at Philippi. Cassius, who was of the Epicurean school, accounted for the appearance philosophically, by remarking, that when the body, as in the case of his friend, was exhausted with labour and vigilance, the regular functions of the mind are naturally suspended or disturbed. The day of decision was now fast approaching, and the plains of Philippi were the destined scene of conflict. Before the attack, Brutus and Cassius met on the plain betwixt the two armies, and there, it is said, expressed their common resolution, that if the day proved unfortunate, they would die as Cato died. Brutus commanded the right wing, which was opposed to Octavianus in the left, and there obtained a complete victory.

The attack of his soldiers was ardent but irregular; and while they pursued the flying enemy into his camp, and even proceeded to plunder, Cassius, chagrined, exposed, and routed, was obliged to retire with a small number to a hill that overlooked the plain. There, ignorant of the success of Brutus, and believing that the enemy were advancing to take him prisoner, he ordered his freedman, Pindarus, to strike off his head. Soon after, Brutus, who had hastened to his relief with a detachment of horse, entered his camp, and weeping over his lifeless trunk, pronounced him the last of the Romans. Tidings of the death of Cassius soon reached the camp of the triumvirs, and so animated their courage, that, notwithstanding the disasters of that day, they resolved to offer battle the ensuing morning. Brutus, however, declined the challenge, and directed his attention to securing in his interest the remainder of Cassius’ army. He now found that it had been easier to reprove his friend for connivance at injustice which he could not prevent, than it was to act up to the rigour of his own principles. Before he ventured upon a second engagement, he thought it necessary to promise his soldiers, that if they acquitted themselves to his satisfaction, he would give them up the cities of Lacedaemon and Thessalonica to plunder. In this interval of preparation, Caesar and Antony received certain intelligence, that their fleet, which was sailing from Italy with a large supply of soldiers, had been defeated by that of Brutus. As they also knew that this intelligence had not reached Brutus, they were anxious to bring on a second engagement before he should be informed of his naval success. Their offer of battle was accepted; the triumvirs were victorious; and Brutus, that he might not fall into the hands of his enemies, threw himself upon his sword. When Antony found the body, he ordered it to be enveloped in a rich robe; and he afterwards sent the ashes to his mother Servilia. Historians differ in their report of the time and circumstances of the death of Portia. According to some testimonies, she died before her husband; while others record, that being resolved not long to survive the tidings of his death, though her friends deprived her of every instrument of destruction, she accomplished her purpose by taking burning coals from the fire, and retaining them in her mouth till she was suffocated. See Plutarch's Lives, and Universal History. (J. M.)

BRYANT, Jacob, an eminent classical scholar, was born at Plymouth, where his father filled an office in the customs. He was educated at Eton and King's College, Cambridge, and gave early proofs of that proficiency in classical literature, which afterwards ranked him as one of the first scholars in Europe. His attainments were so conspicuous, that they recommended him to the attention of the Duke of Marlborough, who chose him for his secretary, and afterwards appointed him as tutor to his sons, whom he accompanied in this capacity to Eton. His friendship with the various branches of that illustrious family, for the honour of all parties, continued unabated till the latest period of his long life; and he was received on the footing of a highly valued friend, not of a humble dependent. Through the influence of the duke, he obtained a lucrative situation in the ordnance department, which enabled him to prosecute his studies without molestation; and to enjoy, what falls to the lot of few scholars, riches, friends, books, and leisure. He lived to the advanced age of 89, and may be said to have flourished during the greater part of the last century. He died at Cypenham near Windsor, where he had long resided, on the 14th of November 1804, of a mortification in his leg, in consequence of a hurt which he received from a chair, in reaching down a book from the shelves of his library.

The life of a scholar is seldom distinguished by any of those bustling incidents which attract the attention of the world; his researches are prosecuted in retirement; and he can explore with greatest advantage the hidden springs of human conduct, or reconcile most readily the anomalous features of human history, when withdrawn from the concerns and ordinary pursuits of the world. It is in his works that we are to trace the progress of those discoveries, which, in many instances, are more useful and interesting to society, than those of the far-famed traveller, or hardy navigator. Whether the speculations of Mr Bryant shall be generally viewed in this light, may perhaps be doubted. They are of too recondite a nature for popular use, but they will never fail to be interesting to the scholar, with all the licence of imagination which sometimes accompanies them. Mr
Bryant: Bryant was not of the number of those scholars who have too frequently issued from the English universities, whose minds are made the receptacle of mere vocables, or the measures of rhetorical quantities: he endeavoured to apply his great erudition to some useful purpose, and to benefit the world, whilst he indulged his propensity for literary and philological investigations.

His first work was entitled, "Observations and enquiries relating to various parts of ancient history, containing Dissertations on the wind Euroclydon, and on the island Melite: together with an account of Egypt in its most ancient state, and of the Shepherd Kings. This work was published in 1767. The account of the shepherd kings is extremely curious; and it is much to be regretted, that the deficiency of materials prevented him from prosecuting the subject so far as could be wished, whilst it compelled him to fill up many chasms with ingenious, but unauthorised conjectures. Indeed the excellencies and defects of Mr Bryant's works are to be ascribed to the same cause, viz. that fearlessness of discussion, which prompted him, on the one hand, to shoot beyond the timid investigations of his predecessors, and on the other, made him too little scrupulous in admitting his own conjectures, when facts were wanting to confirm his theory. It had been doubted whether Melite, the island on which St Paul was shipwrecked, is the modern Malta; because it is said Acts xxvii. 27, that Melite is situated in Adria, or the Adriatic. But Mr Bryant has shown, by conclusive evidence, that the name Adria was applied to almost all the sea lying between Sicily and Africa, and that, therefore, we ought not to argue on the restricted meaning which we now assign to that term.

His next and greatest work was the Analysis of Ancient Mythology, wherein an attempt is made to divest tradition of fable, and to reduce truth to its original purity. In this work it is difficult to say, whether the ingenuity, the learning, or the industry of the author are most conspicuous. At the same time, we admit that imagination has often supplied the place of facts, and confident assertion been substituted for authentic history. We scarcely know any work in our language whose defects and whose excellencies are so conspicuous, nor any to which we could allow so many abatements on the score of inconclusive reasoning, and yet have so much left to demand our unqualified admiration. It exhibits so many new views, and so many elucidations of obscure transactions, that no man who wishes to be acquainted with the more remote history of our species, can safely be ignorant of the Analysis of Ancient Mythology. It might naturally be expected, that a work containing such novel speculations, would excite much opposition, and much admiration. Accordingly we have seen several succeeding mythologists, who, preferring Mr Bryant's unauthorised speculations to the solid facts which he adduces, have carried his mode of reasoning to the utmost pitch of extravagance, so as to prejudice the sober-minded even against his most rational conclusions: whilst others, taking advantage of a few errors in point of fact, or a few slips in point of etymology, have endeavoured to throw discredit on his whole labours, and to represent every part of them as equally uncertain and unsatisfactory. Amongst the latter, Mr Richardson, author of the Persian Dictionary, in a dissertation prefixed to that work, has successfully exposed some of his etymological mistakes, with regard to words of eastern origin. This was, indeed, Mr Bryant's weak side, as he was very imperfectly acquainted with the oriental languages, and it is to be feared, had but a superficial knowledge of the Hebrew, and other ancient dialects of the East. He has a favourite theory with regard to the Amorans, the original inhabitants of Egypt, whose name, as well as desert, he derives from Ham. Nobody would have found fault with him, had he rested satisfied with the latter conclusion: but Richardson has stated an inexpressible objection to the derivation of the name: for though the Greeks and Latins used Ammon and Hammon indifferently, yet the Heli in Ham, is a radical, not mutable or omissible; and had the Greeks or Latins formed a word from it, it would have been Chammow, and not Ammon, even with the aspirate.

The memorials respecting the deluge, which Mr Bryant has collected from the mythology and history of various nations, are extremely curious and interesting. One of these is the Apamean Medal: (see that article,) his dissertation on this subject was severely attacked in the Gentleman's Magazine. Mr Bryant successfully repels this attack, in an essay, printed in the last edition of his works. The medal, indeed, is so very remarkable, that, were we absolutely certain as to its genuineness, we would have little hesitation in adopting Mr Bryant's conclusions.

Another of Mr Bryant's works, which made a great noise, and excited great opposition, was his observations on M. le Chevalier's description of the Trooad. In this work he endeavoured to show that the Trojan war had no foundation but in Homer's imagination: that no expedition was undertaken by the Greeks; and that no such city as Troy ever existed in Phrygia. In this notion he stood almost alone, though he was not without plausible arguments to support his opinion. But every thing connected with Troy has been so long consecrated by the concurring testimony of antiquity, and by the charms of Homer's muse, that it was deemed a kind of sacrilege to doubt the reality of this far-famed city, and its memorable siege. We have no wish to enter the list in this hazardous contest; as some apology, however, for the aberrations of exalted genius, we would suggest that the testimony of antiquity goes for nothing in this case, as the whole depends on the authority of Homer; and unless authors can be cited anterior to him, or coeval with him, or who did not derive their information from him, or some of his transcribers, the whole history of the war must rest on his authority; and if his authority were equal to his genius, the transactions which he records would stand in need of no other support. But certainly as the subject stands at present, were the alternative proposed to us, we would rather reject the whole as a fable, than receive the half as authentic history.

Mr Bryant published a vindication of Josephus's testimony to Christ, which Dr Priestley confessed had completely convinced him: though he did not show the same deference to a work which Mr Bry-
ant published against him, on the subject of philosophical necessity. Mr. Bryant also engaged in the Rowleian controversy, and wrote in favour of the genuineness of the poems. As these poems have generally been exploded as spurious, their supporters have of course obtained but little credit on the score of discernment, and yet Dr Symmons (see Cumberland's Review) still ventures to contend for their authenticity, and to produce plausible arguments in support of his opinion.

Mr. Bryant's talents and labours were always employed to promote the best interests of man, by supporting the great principles of religion. With this view, at the desire of Lady Pembroke, he wrote a treatise on the authenticity of the scriptures, and the truth of the Christian religion. He also published in 1794, Observations on the plagues inflicted upon the Egyptians; in which is shown the peculiarity of those judgments, and their correspondence with the rites and idolatry of that people, with a prelatory discourse concerning the Grecian colonies from Egypt. This is a curious and valuable work. He wrote a volume of dissertations on the prophecy of Balaam; the standing still of the sun in the time of Joshua; the story of Samson and of Jonah; and it is said that other writings to a considerable extent still remain in the hands of his executors.

Mr. Bryant was in his person of low stature, and delicately formed; he was remarkably temperate in his habits; and though he, for the most part, lived as a literary recluse, yet he was animated and sprightly in his conversation, with those friends whom he admitted to his intimacy. He was liberal of his money, affable in his manners, and piety and religion shed a lustre over all his actions. (g)

BUCCANEERS, an appellation originally given to the French settlers in the islands of St Domingo and Tortuga, who subsisted by hunting; but afterwards more generally applied to those daring adventurers, who, towards the close of the seventeenth century, infested the West Indian and American coasts.

The splendid advantages which the Spaniards had derived from their transatlantic possessions, had long inflamed the cupidty, and awakened the enterprise of the other maritime powers of Europe. The English, the French, and the Dutch, had sent out various expeditions, with the view of sharing in the same golden harvest, and had succeeded, if not in exploring new regions abounding in the precious metals, like Mexico and Peru, at least in forming establishments in some of the finest portions of the western hemisphere; where the fertile soil, profusely rewarding, without superseding the labour of culture, was likely to prove, in the end, more valuable than exhaustless mines. The Spaniards, naturally jealous of these intruders, were determined, as far as their arms or influence could extend, to oppose all other nations in their attempts to plant colonies in the New World, which they seemed willing to claim, on the right of discovery, as exclusively their own. But their power was too feeble to crush the spirit of enterprise which their example had roused. Successive hordes of adventurers, migrating from the various nations of Europe, were perpetually encroaching upon their dominions, both on the continent and in the islands of America; and while they were thus kept in constant warfare in defence of their territories, the seas were covered with pirates, eager to seize the galleons which wafted to the parent country the treasures of New Spain.

A colony of French, which had been established in St Christopher's island, was advancing rapidly in prosperity, when its progress was interrupted by repeated descents of the Spaniards upon the shores. The assailants succeeded so far as to compel the greater part of the colonists to abandon the island. Burning with revenge, they immediately joined the Dutch cruisers, who then annoyed the Spanish trade, and their resentment was soon gratified by the capture of several prizes of great value. Their success being reported in France, encouraged several merchants of Dieppe to fit out privateers to join their countrymen in that lucrative game. Prosperous in all their enterprises, they now found the island of St Christopher too distant as a depot for their spoils, and resolved to go in quest of some more convenient asylum, to which they might retire in security, as exigencies required. With this view they at first resorted to Hispaniola, whose numerous herds of wild cattle and other animals, afforded an unfailing supply of provisions for their ships, while its situation seemed to render it a convenient and a safe retreat. The Spaniards, aware of the advantages which it offered to the pirates, had already taken possession of the island, and had stationed there an officer named Alferex, with a company of twenty-five men. These, however, the adventurers easily expelled, and having rendered themselves masters of the island, began next to deliberate in what manner they might occupy it with most security and advantage. The neighbouring island of Tortuga, though considerably smaller, was in many respects even more inviting than Hispaniola; and it was resolved, by mutual consent, that while some remained on the larger island to be employed in hunting, for the use of their comrades, the animals with which it abounded, others should devote themselves to the culture of the soil in both islands; while the rest should continue to scour the seas, and should be supplied by those who remained at home with victuals, and every necessary provision: and all, in case of any imminent danger, were to unite in the common defence. The new settlers were not left long unmolested by their invertebrate and jealous enemies: Tortuga fell several times alternately into the hands of the Spaniards and the French, till at length the former were finally expelled. Though a considerable portion of Hispaniola was inhabited by Spaniards, the adventurers not only retained posses-
Under the name of the buccaneers.

The etymology of the word Buccaneer has been traced by Oxmelin, to a custom which prevailed among the original inhabitants of the Caribbean islands, of roasting their prisoners of war upon frames of clay, placed over very strong fires. These clay frames were called barbacoa; the place where they were erected notcan, and the operation buccaneer, to roast and smoke. What these savages did to their unfortunate prisoners, the hunters practised on the animals slain in the chase, and from that practice they derived their name.

Two classes of hunters.

Of these hunters, some were exclusively employed in the pursuit of wild beves, while others devoted themselves entirely to the chase of wild boars. Though the first of these classes alone were properly distinguished by the name Buccaneers, it was commonly given to both; and, indeed, the only difference between them seems to have consisted in the objects of their pursuit; for in their dress, their weapons, and their manners, they were exactly alike. In their rambling mode of life, the Buccaneers seem to have relinquished all the habits of Europeans, and to have acquired, in their general customs and manners, a striking resemblance to the wandering Arabs and Tartars. With them the chase was not the occasional amusement or occupation of a day, but the continued and serious business of whole months and years. They set out on their hunting expeditions in large bands, carrying along with them small tents of linen, which they pitched during their journey wherever they intended to pass the night. Having reached the place of their destination, they erected small sheds, which they thatched with leaves of the palm-tree; and their tents, spread beneath these sheds, were, during the whole of the hunting season, their only abodes. On these occasions, they possessed every thing in common, living in strict harmony, and prevented by no private jealousies or animosities from pursuing, with united zeal, the grand object of their association.

Each hunter was provided with a number of dogs, one or two of which were particularly trained for tracing the prey; and with a musket of a peculiar construction, manufactured in Europe expressly for their use. They were all, likewise, accompanied by their own servants, who shared the same fare, and generally engaged in the same employment with their masters, but were held, notwithstanding, in the most rigorous bondage, and frequently treated with extreme cruelty. During these expeditions, the life of the Buccaneers was laborious, and their fare but mean. When the hunt was finished, however, and they had returned home with their spoils, they indulged in every species of extravagance and licentiousness, till the want of money again compelled them to submit to the same privations and toils. The few and simple laws which these people had adopted, corresponded well with the rude and primitive state of their society. When two of them happened to quarrel, they referred to the rest of their comrades the cause of their dispute; and if their interference could not produce an accommodation, the affair was decided by duel. Their hunting pieces were the weapons which they made use of on these occasions; and, after measuring their ground, they drew lots for the privilege of taking the first aim. When one of them fell, a strict inquest was held upon his body; and if it was found that his adversary had taken any unfair advantage, he was immediately tied to a tree, and shot through the head.

Such was the state in which the Buccaneers continued to live for more than half a century after their first establishment in Tortuga and Hispaniola, which took place about the year 1632. Several circumstances then concurring to make them, as well as the other settlers in these islands, relinquish their usual employments, and attempt some new means of subsistence. The cattle and wild boars were now nearly exterminated; the assaults of the Spaniards had become more frequent and harassing; and, what was a still more formidable evil, the French government had created a West Indian Company, with peculiar privileges, to colonize the islands which the valour of the adventurers had won, and to establish there a regular trade. Thus deprived of all the advantages which their situation had hitherto afforded, they were still hesitating what new course they ought to pursue, when the splendid success of Pierre Le Grand, a Norman pirate, induced many of them to quit their habitations, and again to try their fortune in cruising against the Spaniards, by whom they had been so much annoyed. With a crew of only twenty-eight determined fellows, sworn to adhere in all extremities to their leader and to each other, Pierre had resolved to attack, in an open boat, the ship of the vice-admiral of the Spanish fleet, which then lay at anchor in the channel of Bahama. He set out about the dusk of evening on this daring exploit; and to render their attack more desperate, had directed holes to be made in the boat, that it might sink as soon as they had reached the enemy's ship. The Spaniards, who had not perceived their approach, were easily overpowered; the captain and officers were compelled to surrender; and Le Grand, detaining as many of the crew as were necessary to work and man the vessel, carried off his magnificent prize in triumph to France. This romantic adventure excited a general spirit of emulation among the Buccaneers of Tortuga, to whom it opened, at the same time, the most flattering prospects. So sanguine indeed were their hopes, and so eager their thirst for spoil, that, without waiting till they could procure proper vessels, they ventured forth in their canoes; and entering the port of the Havannah, carried off a number of boats laden with tobacco, and other articles of value. These prizes enabled them to fit out ships of considerable size, and to undertake voyages of greater length. In their next expedition they took several large vessels laden with plate; their success attracted crowds of new adventurers; and they became so formidable, that the Spaniards found it necessary to send out several large ships of war for the protection of their trade. These pirates, though afterwards joined by the turbulent and daring spirits of various nations, still retained the name of Buccaneers; and continued to be, for more than twenty years, the terror of every regular trader to the American shores. Even the legends of romance can scarce furnish any parallel to their exploits; and the
singular character of their society renders their history an anomalous in the annals of the world.

Drawn together by a common dislike to the restraints of regular society, independence and licentiousness were the leading features in the character of these adventurers. To act in concert, indeed, it was necessary that they should submit to some regulations; but these were dictated, not by the authority of a superior, but by some general feeling of propriety, or sense of expediency. They were generally divided into companies of thirty, forty, or fifty men, electing from themselves, as their captain, the person on whose conduct and valor they placed the greatest reliance. The authority of this captain was seldom acknowledged, except in the moment of battle, when his orders were most implicitly obeyed. Each individual of the crew was obliged to furnish a certain quantity of powder and balls, and to provide himself with a musket, a pair of pistols, and a cutlass or sabre. Having laid in a sufficient stock of provisions, and having determined, by mutual consent, in what place they should cruise, they next bound themselves to agree to certain articles, specified in a written contract, which each of them signed; nor was it ever known that the articles, which they had thus sanctioned, suffered the slightest violation. The purpose of these contracts was to regulate, with precision, the share of any prize to which they should be respectively entitled; and to make provision for those who should happen to be wounded or disabled during the cruise. If the boat, or vessel, in which they set out, was the common property of the crew, the first vessel which they captured was to be given to the captain, with a single share of the booty which it contained: if the captain had furnished the boat, he was not only entitled to the first ship which was taken, but likewise to a double share of its cargo. The surgeon was allowed a certain sum, generally 200 crowns, for his chest of medicines, besides one share of the prize. And whoever had the good fortune to discover a ship which was captured, received a reward of one hundred crowns. The remainder of the spoils was distributed in equal shares among the crew. Before this distribution, every man, placing his hand on a New Testament, solemnly swore that he had not appropriated or concealed any part of the plunder; and if any of them was convicted of perjury, a case which very rarely occurred, he was conveyed to some desert rocks, as a person unfit for society, and his portion of the prize was either divided among the rest of the company, or appropriated to some religious or charitable use. The loss of an eye entitled the sufferer to 100 crowns, or a slave: the loss of both eyes to 600 crowns, or six slaves. A person maimed of a right hand, or right leg, received a donation of 200 crowns, or two slaves: the loss of both hands, or both legs, was supposed equivalent to the loss of both eyes, and gave a claim to the same sum. If any one happened merely to be disabled in any of his limbs, he was entitled to the same compensation as if he had lost it entirely. So sacred were these claims held, that if they had not money enough to answer them, the whole company voluntarily undertook a fresh expedition, till they realized a sufficient sum to enable them to satisfy such honourable obligations. Their justice and fidelity extended even to those who had fallen in the common cause. Each of them, before setting sail, attached himself to a comrade, with whom he was to exchange every good office during the voyage; if either of them happened to be wounded, or fall sick, the other tended him with the most affectionate care; and a formal will was made between them, that if one of them should die on the expedition, his companion might inherit whatever he possessed. In the distribution of their plunder, the share which should have fallen to the deceased was faithfully assigned to his comrade; and if both of them had perished, their effects, with their portions of the spoil, were sent, without any diminution, to their nearest relations.

We form, in truth, a very unfair estimate of the character of the Buccaneers, when we regard them merely as a set of robbers, leagued together by an indiscriminate love of rapacity and violence. Their piratical adventures originated in a natural wish to retaliate the many and grievous injuries which they had suffered from the Spaniards, whom they always continued to regard as their only fair and lawful prey; though, in cases of extreme necessity, they were sometimes compelled to attack the ships of other nations. It may be difficult to vindicate, on any maxim of morality, an avowed system of plunder. Yet it is certain that this system appeared to themselves, at least, perfectly compatible with the laws of justice and religion; and the regularity of their devotions, and their confidence in the protection of heaven, would have done honour to the champions of the purest cause. They never partook of a repast without solemnly acknowledging their dependence on the Giver of all good. On the appearance of a ship which they meant to attack, they offered up a fervent prayer for success; and, when the conflict had terminated in their favour, their first care was to express their gratitude to the God of battles, for the victory which he had enabled them to gain. The character of the Buccaneers, however, was formed of inconsistencies: with all this appearance of religion, they indulged in the grossest vices, and were guilty of atrocities, the bare recital of which makes humanity shudder. Their vices arose naturally enough, indeed, out of their situation; for to spend with profusion, and to riot in the wildest excess, was exactly what might be expected of men, who had a constant resource in their favour, who spurned the restraints of regular society, who were inured to continual vicissitudes of privation and abundance, of hardship and ease; and whose occupation exposed them to the constant peril of their lives. Instances of their profusion are recorded, which appear hardly credible. It was no uncommon thing with them to spend two or three thousand crowns in one night. Their captains, on returning from a cruise, would sometimes buy whole pipes of wine, and breaking them up in the street, compel every person that passed to assist them in drinking it. One of them, who had returned from an expedition with three thousand dollars, was, in three months after, sold into slavery for a debt of forty shillings, which he had contracted in a tavern. In short, the maxim on which they uniformly acted was to enjoy the present moment, without regard to the future. Exposed as we are, said they, to such a variety of dangers, our life is totally different from that of other men. Why should we, who are alive to-day, and may be dead to-morrow, think of hoarding up? Our concern is to squander life away, rather than to preserve it. The reasoning
BUCCANEERS.

was natural, and their character would have been consistent had they made no pretence to religion. We may apply the same remark to the enormous cruelties which they committed against the Spaniards; for which the law of retaliation, though it affords no apology, would very naturally account; but which were altogether irreconcilable with the mild spirit of that religion, for which they professed a profound regard. If the ships which they captured contained a cargo that pleased them, they generally sent their crews on shore without farther injury; if the prize was of little value, they took revenge for their disappointment on the unfortunate mariners, whom they inhumanly butchered, or threw into the sea.

Having thus attempted a general delineation of the character and manners of these singular pirates, we shall now give a short and hasty narrative of the most remarkable of their romantic adventures. The first of their captains who distinguished himself, after Pierre le Grand, was Pierre Françoise, a native of Dunkirk. He had cruized, without success, before the Cape de la Vella, in the hope of intercepting some of the merchant vessels bound from Maracaibo to Campeachy, till his store of provisions was nearly exhausted, and his boat became so leaky as to be scarcely able to weather the sea. In this extremity he formed the desperate resolution of attacking the Spanish barks, which were then engaged in the pearl fishery, in the stream de la Hacha, near the river de la Plata. About a dozen of these barks used to sail annually from Cartagena, protected by an Armadilla, or war ship, mounting from 24 to 30 pieces of cannon, with a suitable crew. The command of this fleet was entrusted to a captain, into whose ship were brought every evening all the pearls which had been fished by the whole fleet during the day. With only twenty-six comrades, as resolute as himself, Pierre Franc attacked the captain's ship, which carried eight guns, and was manned with a crew of three-score well armed men. The Spaniards, after a stout resistance, were compelled to surrender. But the triumph of Pierre was of short duration; he was pursued by the Armadilla, and having lost his main-mast in a squall, was speedily overtaken. The pirates, now only 22 in number, defended themselves with the most obstinate valour; and though compelled at length to yield to such superior force, their enemies were fain to grant them honourable terms of surrender.

Equally daring and more varied were the adventures of Bartholomew, a Portuguese, who had fitted out, in Jamaica, at his own expense, a small brigate, carrying four guns, and 50 men. He was cruizing in this brigantine off Cape Corientes, in the island of Cuba, when he fell in with a large Spanish ship, mounting 20 guns, bound from Maracaibo for the Havannah. Undaunted by the superior strength of this vessel, Bartholomew immediately came up with it; and after an obstinate combat, he at length succeeded in making it his prize. Its cargo was extremely valuable; and the pirates were exulting in their success, when three large Spanish ships unexpectedly bore in sight, and seemed to give them chace. As their prize was heavily laden, it was impossible to escape; and their strength being too inferior to afford them any hope in resistance, they surrendered at discretion. Two days after this disaster, the ships were separated from each other by a furious tempest, which drove the pirates upon the shore of Campeachy. The inhabitants recognised Bartholomew, and immediately condemned him to be hanged. He had already been their prisoner on a former occasion, and found means to escape. Afraid, therefore, to bring him on shore, lest he should again elude their vengeance, they kept him, loaded with irons, in the ship in which he was taken, till they had prepared a gibbet for his public execution. Bartholomew, apprised of their intentions, resolved still to make an effort for his escape. Having by some means disengaged himself from his fetters, he fastened to his sides two empty jars, so closely corked as to be completely water-tight, and after murdering his centinels, committed himself to the waves. Though unaccustomed to swimming, the jars supported him till he had reached the shore, where he concealed himself in a thick forest, not far from the town. Here he remained for three days, subsisting upon wild herbs and roots, and afraid every moment of being taken by the Spaniards. He chose for his retreat the hollow of an old tree, from which he discovered his enemies searching for him through the forest; and when he thought himself safe from their pursuit, he sallied forth towards the shore, with a view of travelling to Golfo Triste, from which he was then about thirty leagues distant. Here he arrived after incredible hardships, and having found there some vessels of pirates, to whom he was known, he related to them his misfortunes, and requested them to furnish him with a boat, and 20 men, with whose assistance he engaged to seize the ship in which he had been detained as prisoner, and thus to have some revenge for his wrongs. His request being immediately granted, he came to the harbour of Campeachy by night, and springing on board of the vessel with his comrades, murdered the centinels and the rest of the crew, cut the cables by which she was moored, and before day light was out of view of the town. His triumph on this occasion, however, was as transient as the last; for, while sailing towards Jamaica with his prize, he was overtaken by a violent storm, which dashed the ship to pieces against the rocks of Pinos, and all his newly acquired treasure perished in the waves. Bartholomew, with his companions, reached Jamaica in a canoe; and he engaged in various other enterprises, but was unsuccessful in them all.

It would be endless to detail all the romantic exploits of these daring adventurers. In such terror did they keep the Spanish colonists, that they would no longer venture to sail from their harbours; but resigning all the advantages of their situation and connections, formed themselves into so many distinct and separate states. "This" says Raynal, "was the origin of that spirit of inactivity, which continues to this day." This inactivity, however, served only to open new temptations to the enterprise of the Buccaneers. No longer successful in their cruises, they determined to try what they could plunder on shore. The most fertile provinces of New Spain were pillaged and laid waste. Agriculture became as much neglected as navigation; and the dastardly Spaniards were as afraid to appear in the public roads, as to traverse the seas by which their various colonies were disjoined.

In this new species of excursions, Montbar, a gentleman of good family in Languedoc, was particularly distinguished. While yet a mere childly, he had acci-
BUCCANEERS.

Buccaneers.

dently received a circumstantial account of the enormities practised by the Spaniards in the conquest of the New World; and conceived against them an aversion, which taking possession of his whole mind, arose at length into a species of frenzy. When attending college, he happened to perform in a play, the part of a Frenchman quarrelling with a Spaniard; his imagination took fire, and he fell with such fury upon his companion, whom he mistook for a real Spaniard, that he would certainly have put him to death, had not the bystanders interposed, and convinced him of his delusion. He could think of nothing, in short, but the deeds of horror which the Spaniards had committed against the unoffending natives of their American provinces; and was inflamed with an irresistible ardour to avenge their innocent blood. With this resolution he sailed from his native country, in order to join the Buccaneers, whom he had heard represented as the most invertebrate enemies to the Spanish name. On his voyage to America, the ship in which he sailed fell in with a Spanish galleon, which was immediately boarded by the Frenchmen. Montbar, exulting in this opportunity of vengeance, rushed upon the enemy with the fury of a tyger, and hurrying twice from one end of the ship to the other, levelled all who dared to oppose him. He left to his companions the pleasure of dividing the rich booty which they had taken, contenting himself with the savage enjoyment of contemplating the dead bodies of the Spaniards, the first victims of the revenge which he had sworn against their nation. When his ship reached St Domingo, a party of Buccaneers came on board to barter fresh provisions for brandy. As an apology for the trifling value of the articles which they offered, they complained that the Spaniards had overrun the country, laid waste their settlements, and carried off whatever they could find of value. "Why," cried the indignant Montbar, "do you suffer such outrages to pass unreven- ged?" "Think not," replied they, "that we are so tame and dastardly. The Spaniards, who dare not attack us openly, took advantage of our absence while employed in the chase. We are now going to join some of our companions, who have been more in- jured than ourselves, and we shall take ample vengeance for all our wrongs." "Let me," said Montbar, "be your leader; the only pre-eminence I demand is to be the foremost in attack." The fury that flashed from his eyes, while he spoke these words, at once recommended him to the Buccaneers, as the most proper person to conduct them to re- venge, and his offer was cheerfully accepted. That very day they overtook the enemy, whom Montbar attacked with an impetuousity that astonished the bravest of his comrades; and the Spaniards, though far superior in numbers, were routed with prodigious slaughter. The triumph of Montbar was greatly heightened by the revolt of some Indians, whom the Spaniards had engaged in their service. While these men were galling the Buccaneers with their arrows, "What!" cried one of the Buccaneers, pointing to Montbar, "do you not perceive that God has sent you a champion to deliver you from the tyranny of the Spaniards, and will you yet fight in the cause of your tyrants?" The Indians paused for a moment, and seeing the heroism of Montbar, immediately joined his party, and turned their arrows against the Spaniards. The other achievements of Montbar were equally brilliant and successful. He received the name of Exterminator; to which dreadful dis- tinction he was well entitled by the numbers of Spaniards who were sacrificed, both by sea and land, to his restless and inatable hatred.

The Spaniards, being now obliged to confine them- selves within their settlements, the Buccaneers resolved to leave them no security in their persons. They began, therefore, to harass them by a new mode of warfare, uniting in formidable bands, and making incursions into the territories of their enemies. At the head of the first of these associations, or regiments of Buccaneers, was Francis L'Olonois, so called from the sands of Oloone, where he was born. From the abject state of a bondman, this man had raised himself, by his courage and conduct, to the command of two canoes, with 22 men. He was cruising with them, off the coast of Cuba, when an Armadilla mounting ten pieces of cannon, with a crew of eighty vigorous young fellows, was sent against him by the governor of the Havannah. At the sight of this vessel, the pirates opened to a creek, where they concealed their canoes among the trees. The frigate, without perceiving them, came to moor in the same creek, and the adventurers, having an opportunity of surveying it at leisure, resolved to attack it without delay. They rowed gently along the shore, under cover of the trees, and stationing themselves on both sides of the enemy's ship, began at break of day to fire upon it from their concealment. The Spaniards failed not to return the fire, without being able, however, to do any injury to their unseen foe. This unequal comb- at continued till noon; when the Spaniards, having lost the greater number of their men, suspended their firing, and prepared to retreat. L'Olonois immedi- ately pursued them with his canoes, and, after a faint resistance, the Spaniards surrendered. Their barbarous conqueror was proceeding to put all the wounded to death, when a negro slave, dreading the same fate, threw himself at his feet, and offered to make an important discovery if he would spare his life. Having obtained his promise to that effect, he declared that the governor of the Havannah had sent him on board the ship to serve as executioner to the Buccaneers, whom, in the confidence of their being taken, he had ordered to be hanged. Fired with rage at this discovery, L'Olonois ordered all the Spaniards to be brought before him, and struck off their heads, one after another, with his sabre. One alone was left alive to be sent to the governor of the Ha- vannah, with a letter from L'Olonois, in which he informed him of the fate of his frigate and its crew, threatening the same treatment to all the Spaniards who should fall into his hands, among whom he did not despair of yet numbering the governor him- self. L'Olonois was now master of an excellent ves- sel, but his crew was small, and his hopes of treasure had been disappointed. With a view of procuring both men and plunder, he sailed to the port of Mara- caibo, where he took, by surprise, a sloop laden with plate and other articles of value. With these prizes he returned to Tortuga, where he was received by the inhabitants with unbounded joy, and crowds of adventurers flocked around him, offering to follow his fortunes wherever he should lead. Among other admirers of his valour and success, was Michael de Basco, who had signalized himself by many daring exploits, and particularly of late, by taking, even
under the cannon of Porto Bello, a Spanish ship of
war, whose cargo was estimated at one million of
crowns. These two adventurers concerted an expedi-
tion against the Spanish towns in Terra Firma; and
having invited all the Buccaneers then in Tortuga
to join in this glorious enterprise, they soon
collected a force of 600 men. Michael, being
well acquainted with the places which they meant
to invade, was to have the command of this force by
land; and of the fleet, consisting of about eight ves-
sels, L'Olonois embarked as admiral, in a ship which
mounted ten guns. This armament, the largest which
the Buccaneers had ever been able to raise, had
scarcely set sail, when it fell in with and captured
two large Spanish ships, one of which, besides an
immense cargo of cocoa nuts, contained money and
jewels to the value of 50,000 crowns, and the other
furnished them with a large store of gunpowder, be-
sides muskets and arms of various descriptions.
Encouraged by these captures, which seemed to augur
well of the enterprise, they proceeded to the bay of
Venezuela, which runs up the country for about fifty
leagues. At the mouth of this bay, which is like-
wise called the lake of Maracaibo, are two small
islands, on one of which were erected a watch tower
and a fort, to guard the entrance against any hostile
fleet. The first achievement of the Buccaneers was
to carry this fort by storm, to spike the cannon, and
to put to the sword the whole garrison, consisting
of two hundred men. They next proceeded to Ma-
ricaibo, which they found deserted by the inhabitants,
who had retired with their effects to the small town
of Gibraltar on the other side of the bay.

The adventurers, on entering Maracaibo, found
its houses well supplied with provisions, and its cell-
ars stored with excellent wines. Fifteen days were
lost by the pirates in riot and debauchery, and the
Spaniards had improved the interval in fortifying
Gibraltar by powerful batteries along the shore, bar-
racing the highways, and protecting, by strong
entrenchments, every approach to the town. One
wallow path alone had been left open for the conve-
nience of the inhabitants, and that path, too, was
commanded by a battery. By these obstacles, how-
ever, formidable as they were, the intrepid adven-
turers were not to be discouraged. "Here," cried
L'Olonois to his comrades, "are the richest of the
Spaniards; we must take them and their treasure,
or perish in the attempt." When they had approach-
ed within pistol-shot of the entrenchments, whole
ranks of them were cut down by the artillery and
musketry, which the Spaniards levelled against them
with a cool and certain aim. But their danger only
roused them to more desperate efforts of courage;
and the last breath of the fallen was spent in animat-
ing their comrades to conquer, or to die gloriously
like them. Their perseverance was crowned with
victory; with the help of large branches which they
had carried with them on purpose, they forced the
entrenchments in several places; and, after a furious
battle, in which the Spaniards displayed unusual
valor, they at last became masters of the town.

Of a garrison of six hundred men, four hundred
were killed upon the spot, one hundred were wound-
ed, and scarcely a single officer survived the carnage
of that dreadful day.

The booty, though large, was insufficient to sat-
tify the rapacity of these unprincipled robbers, who
inflicted on many of their prisoners the cruelest tor-
tures, in order to extort from them a discovery of
the places in which they supposed their treasure to
be concealed. They remained four weeks in Gibral-
tar, during which time their numbers were consid-
érably diminished by a violent fever, occasioned chief-
ly by the putrefaction of dead bodies which they
had left unburied on the ground. At length, after
setting fire to the town, they returned to Maracaibo,
which would have shared the same fate, had not the
inhabitants agreed to pay them a ransom of thirty
thousand crowns. Not content, however, with this
sum, for which they themselves had stipulated, they
robbed the churches of their bells, images, and pictures,
for the pretended purpose of decorating a chapel
which they designed to build in Tortuga. When they
came to share the plunder which had accrued from this
expedition, they found it amount, in all, to 260,000
crowns in money, plate, and jewels; besides other
commodities, equivalent to at least 100,000 more.

With this bootie they returned to Tortuga, where
L'Olonois had not continued long when his neces-
saries again compelled him to undertake some new ad-
venture. He soon saw himself at the head of eight
hundred resolute fellows, ready for any daring enter-
prise. When they were out at sea, he disclosed to
them his intention of making a descent on the shores
of the lake Nicaragua, where they could not fail to
find such quantities of treasure as would amply compen-
sate for any hardships or perils they might encounter
in their undertaking. His fleet was forced into the
bay of Honduras by a current, which baffled all his
efforts to get out again to sea. It was therefore re-
solved to remain there during the rest of the season;
and, in the mean time, to plunder all the Spanish
towns and villages situated on the two shores of the
bay. L'Olonois, with about three hundred of his fol-
lowers, set out for the town of St Pedro. After a
feeble resistance, the town surrendered on condition
that the inhabitants should be allowed two hours to re-
tire. That short space of time they employed so well,
that the adventurers found but little left behind for
them to plunder. On his return to the rest of his
comrades, L'Olonois found them extremely dissatis-
fied with the result of their enterprise, and chagri-
ned at the state of inactivity in which the current
forced them to remain. Many of them even secretly
resolved to take the first opportunity of returning
to Tortuga; and when L'Olonois proposed to sail
to the river Guatemala, they openly abandoned him,
and under the direction of two of their captains,
steered their course towards home. Notwithstanding
this defection, L'Olonois proceeded on his enter-
prise; and arrived at the mouth of the Nicaragua.
Here he was immediately discovered by the Indians,
who, in conjunction with the Spaniards, suddenly
fell on the small band of adventurers, and put most
of them to the sword. L'Olonois, with a handful of
his followers, escaped into their boats, but were
only reserved for more dreadful misfortunes. Com-
pelled by want of provisions to land on the shores
of Darien Straits, they were seized by the Indians,
who, exasperated by their depredations, tore L'Olo-
oois limb from limb; threw his members, yet quiver-
ing, into a fire, and scattered his bones in the air.

By far the most celebrated, however, of all these
adventurers, was a Welshman, named Morgan, gene-
 rally distinguished by the title of Sir Henry Morgan.
Disliking the occupation of his father, who was a wealthy yeoman, Morgan had eloped from home, while yet a boy, and had engaged himself on board a ship bound for the island of Barbadoes. As soon as he reached that place, his master sold him into bondage; and during his servitude, Morgan heard much of the adventures of the Buccaneers, whom he resolved to join as soon as he should recover his liberty. With this view he repaired to Jamaica, the rendezvous of the English pirates; and finding there two vessels ready to sail on a cruise, he offered his services to one of the captains, and was willingly received. After distinguishing himself in several voyages, he proposed to some of his companions that they should conjointly purchase and equip a vessel for themselves, to which proposal they at once agreed, and unanimously appointed Morgan their captain. On his first cruise, he took several valuable prizes, which he carried into Jamaica. Mansvelt, an old experienced adventurer, was then employed in equipping a considerable fleet, with a design of making a descent upon the continent, and pillaging some of its richest towns. The distinguishing success of Morgan recommended him to Mansvelt as a most desirable coadjutor, and he accordingly appointed him his vice-admiral in his projected expedition.

With a force amounting to five hundred men, they proceeded first to the island of St Catherine's, and demolished all its fortifications, except one small castle, which they garrisoned with a hundred of their own men, along with the slaves whom they had taken from the Spaniards. After this conquest, they again set sail, and proceeded to the town of Nata. The governor of Panama having been apprised of their design, they returned to St Catherine's, which they found in the same state in which they had left it. Mansvelt, fully aware of the advantages of this island, as a place of shelter and rendezvous to the pirates, applied to the governor of Jamaica for a force sufficient for its protection. With this request, however, the governor declined to comply; and, in a short time after, the island was retaken by the Spaniards.

The death of Mansvelt having now left Morgan the principal hero among the pirates, he proclaimed his design of making another descent on the Spanish territories, and soon saw himself at the head of seven hundred men. His first expedition was directed against Port-au-Prince, a village in the island of St Cuba, whose extensive commerce, carried on through the medium of the other towns in the island, seemed to promise a booty as rich, as its conquest would be easy. Warned of his design, the inhabitants of Port-au-Prince concealed their treasure, and conveyed their moveable effects to a place of safety.—They next prepared for the reception of their invaders, by mustering all the inhabitants capable of bearing arms, barricading the highways, and placing several parties in ambush, each supported by some pieces of artillery. The adventurers, finding the roads impracticable, made a path for themselves through the woods, and thus escaping the ambuscades, came to a plain before the town, where the Spaniards were drawn up in order of battle. A sharp conflict ensued, in which the Spaniards were completely routed, and most of them either left dead on the field, or overtaken and slain in their flight.—

Those within the town defended themselves with obstinate valour, but were at length compelled to surrender. When the adventurers saw themselves masters of the towns, they shut up all the inhabitants in the churches, ransacked every house for plunder, and laid waste all the country round.

Morgan next resolved to attack Portobello, a A.D. 1668. strongly fortified town in the province of Costa Rica. His plan of operations was so well concerted, and so ably executed, that he came upon the city by surprise, and took it almost without opposition. But the most respectable of this inhabitants had retired within the castle, where they were determined to defend themselves to the last extremity. In order to reduce them with greater facility, he compelled the women and the priests, many of whom he had taken prisoners, to fix the scaling ladders to the walls, persuaded that the gallantry and superstition of the Spaniards would prevent them from firing upon these objects of their affection and veneration. The governor, however, seeing through the device, desired his soldiers to fire upon all who should attempt to fix a ladder against the walls; and it was not till many of these unhappy persons, as well as of their tyrants, had perished in the assault, that the castle was stormed, and all the Spaniards, except the governor, threw themselves at the mercy of the conquerors. That valiant man resolutely rejected every condition of surrender which they could propose, and, in spite of the tears and entreaties of his wife and daughters, resolved rather to die as a hero, than purchase his life by submission to ruffians.

The adventurers having thus obtained possession of the whole town and its forts, spent some days in collecting all the plunder they could find; and in torturing, with ingenious cruelty, their wretched prisoners, to extort from them a discovery of their hidden treasures. Having loaded his ships with all the booty he could procure, Morgan next compelled the inhabitants to ransom their city from the flames, by the enormous sum of 100,000 crowns; and with this treasure he prepared to return to Jamaica. Before he set sail, a messenger came to his fleet from the governor of Panama, who requested to know by what kind of arms the adventurers were enabled to achieve such splendid exploits. Morgan received the messenger politely, and sent him back to his master with a musket and a few balls, as a specimen of the arms which he employed. The governor, pleased with this mark of civility which he did not expect, charged his messenger with a beautiful emerald ring, as a present to Morgan; and with a letter, expressing his regret that such valour as his should not be employed in a more honourable cause. "Carry my thanks to your master," said Morgan, "for his obliging present; and inform him, that, as I sent a specimen of our arms to gratify his curiosity, he shall soon have the additional satisfaction of seeing in Panama with what address we can use them."

Morgan next proceeded to Maracaibo, which he took without much difficulty; and the spoil of which, the sum he exacted for its ransom, was estimated at 250,000 crowns. On his return to Jamaica, he was received with great joy by the inhabitants; and new adventurers crowded to him in such numbers, that he soon collected a force of 1000 men. With those he sailed to the island of St Catherine's, which he was anxious to wrest out of the hands of the Spaniards, and to retain as a place of rendezvous,
of shelter, and of refreshment to the adventurers, who might happen to be cruising in the neighbourhood. The island was sufficiently strong to baffle the assaults of a much greater army than that of the Buccaneers; yet they obtained possession of it almost without an effort, through the treachery, or the cowardice of the governor, who, on their first appearance, sent privately to Morgan, to concert measures how he might surrender, without sacrificing his reputation as an officer, and the governor of such an important place. It was agreed between them, that Morgan should attack by night a fort at some distance; and that the governor, sallying out for its defence, should be suddenly attacked in the rear, and taken prisoner, after which the fort would immediately surrender. To render the deception more complete, a smart firing was to be kept up on both sides, but so directed as to do no mischief to either army. The farce was admirably conducted. The Spaniards, without being really exposed to any danger, appeared to have fought with great valour; and the Buccaneers, to secure the possession of the island, demolished its fortifications; and loading their vessels with a prodigious quantity of warlike stores, steered their course towards the river Chagre, for the purpose of invading the city of Panama. The entrance of this river was defended by a fort, apparently impregnable, built upon a steep rock, which projected into the sea. The governor of this castle was a man of extraordinary abilities and valour, and his garrison was worthy of such a commander. The assaults of the Buccaneers were repelled with such effect, that they would probably have been obliged to raise the siege, had not an accident of a very strange nature disconcerted the Spaniards, and reduced them to the necessity of surrendering at discretion. An arrow had pierced the body of one of the Buccaneers, who, with astonishing resolution, pulled it out, and winding a little cotton around it, shot it from his musket back into the castle. The cotton, kindled by the powder, alighted upon the thatch of some houses within the fort, which immediately caught fire; and the flame communicated to a powder magazine, whose tremendous explosion spread ruin and consternation among the Spaniards. In addition to this misfortune, their brave commander was killed, while performing prodigies of valour; and the besiegers, taking advantage of this double calamity, made themselves masters of the place. Morgan sailed up the river in his boats, till he came to Cruces, where it ceases to be navigable. He was still five leagues distant from Panama, on his march towards which, he was met by a considerable body of troops, whom he soon put to flight, and, without farther resistance, entered the city, which was now abandoned. Amazing quantities of treasure were found concealed in wells and caves; and the parties, which were sent to scour the country, returned with much valuable spoil from the neighbouring forests. Not content with this, however, they exercised the most dreadful tortures on the prisoners who had fallen into their hands, in order to oblige them to discover the places where their riches were concealed; and the Spaniards seemed now to be expiating, by their sufferings, the massacres and cruelties of which their ancestors had been guilty in the conquest of those very regions, and in the acquisi-

Buccaneers.

-of shelter, and of refreshment to the adventurers, who might happen to be cruising in the neighbourhood. The island was sufficiently strong to baffle the assaults of a much greater army than that of the Buccaneers; yet they obtained possession of it almost without an effort, through the treachery, or the cowardice of the governor, who, on their first appearance, sent privately to Morgan, to concert measures how he might surrender, without sacrificing his reputation as an officer, and the governor of such an important place. It was agreed between them, that Morgan should attack by night a fort at some distance; and that the governor, sallying out for its defence, should be suddenly attacked in the rear, and taken prisoner, after which the fort would immediately surrender. To render the deception more complete, a smart firing was to be kept up on both sides, but so directed as to do no mischief to either army. The farce was admirably conducted. The Spaniards, without being really exposed to any danger, appeared to have fought with great valour; and the Buccaneers, to secure the possession of the island, demolished its fortifications; and loading their vessels with a prodigious quantity of warlike stores, steered their course towards the river Chagre, for the purpose of invading the city of Panama. The entrance of this river was defended by a fort, apparently impregnable, built upon a steep rock, which projected into the sea. The governor of this castle was a man of extraordinary abilities and valour, and his garrison was worthy of such a commander. The assaults of the Buccaneers were repelled with such effect, that they would probably have been obliged to raise the siege, had not an accident of a very strange nature disconcerted the Spaniards, and reduced them to the necessity of surrendering at discretion. An arrow had pierced the body of one of the Buccaneers, who, with astonishing resolution, pulled it out, and winding a little cotton around it, shot it from his musket back into the castle. The cotton, kindled by the powder, alighted upon the thatch of some houses within the fort, which immediately caught fire; and the flame communicated to a powder magazine, whose tremendous explosion spread ruin and consternation among the Spaniards. In addition to this misfortune, their brave commander was killed, while performing prodigies of valour; and the besiegers, taking advantage of this double calamity, made themselves masters of the place. Morgan sailed up the river in his boats, till he came to Cruces, where it ceases to be navigable. He was still five leagues distant from Panama, on his march towards which, he was met by a considerable body of troops, whom he soon put to flight, and, without farther resistance, entered the city, which was now abandoned. Amazing quantities of treasure were found concealed in wells and caves; and the parties, which were sent to scour the country, returned with much valuable spoil from the neighbouring forests. Not content with this, however, they exercised the most dreadful tortures on the prisoners who had fallen into their hands, in order to oblige them to discover the places where their riches were concealed; and the Spaniards seemed now to be expiating, by their sufferings, the massacres and cruelties of which their ancestors had been guilty in the conquest of those very regions, and in the acquisi-
tion of those riches, which were now wrested from them by the same means.

Among the captives taken by the adventurers on this occasion, one lady attracted particular attention. She was a native of Spain, and the wife of an opulent merchant, whose business had some time before called him to Peru. She was still in the bloom of youth; her raven tresses waved over her ivory brow, "like shadows o'er the winter snow;" her cheeks, naturally ruddy, were heightened by a tropical sun into a warmer glow; and her fine black eyes, dazzling with uncommon lustre, gave animation to the noblest countenance that ever the hand of nature delineated, or poets' fancy conceived. The interest which her unhappy situation excited, was heightened into admiration by her elevated men; and her whole deportment indicated a soul incapable of being degraded from its native rank by any reverse of condition, or any depth of misery. Even the heart of Morgan, unused as it was to the tender emotions, did homage to this dignified beauty. He felt for her a kind of affection, for which he could not well account; and the natural impetuosity of his temper was checked by an involuntary respect, which her dignity inspired. He assigned her a separate house, with a retinue of servants, whom he directed to treat with a regard adequate to her former rank. He visited her frequently; he was daily more charmed with her beauty and her conversation; he felt the respect which she had at first inspired, growing into a passion that could no longer be resisted. One of her servants, to whom he disclosed his secret, was employed to learn the true form of him by the lady, and to prepare her for compliance with his desires. At length he ventured to throw out some hints of his attachment, and to usurp some freedoms, which her delicacy could not brook. "Morgan," said she, with overawing composure, "your treatment of me, since I became your captive, has given me a high opinion of your benevolence; do not, I entreat you, compel me to change that opinion, by attempting to take an ungenerous advantage of my present misfortunes." He retired abashed; but his disappointment only gave new ardour to his passion. Next day he renewed his visit; avowed his design in still more offensive terms; and, chagrined by the lady's determined rejection of his proposals, grasped her with violence, and was proceeding to force her to compliance with his brutal desires. For this emergency the lady was prepared; and displaying a dagger, which she had concealed in her bosom, "Infamous man!" cried she, "urge me no farther. This dagger shall be my protection from your insults. I can bear to die, but shall never be dishonoured." Morgan, perceiving her resolution unalterable, desisted from his attempts, and left her in despair. His pride, mortified by her obstinacy, now converted his passion into deep-rooted hatred; and with the meanness inseparable from ignorance and vulgarity, he revenged with brutal cruelty that inviolable virtue, which a more generous heart would, in similar circumstances, have been inclined to idolize. He deprived her of her attendants; confined her in an unwholesome cellar; and, to give some plausible apology for this unaccountable change in his conduct towards a lady for whom all were interested, pretend-
ed that he detected her in a correspondence with his
enemies. But his persecution only gave new fortitude to this Spanish Lucretia; and his comrades, impatient of their delay in a place where they could find no more plunder, urged him to depart. Unable longer to withstand their remonstrances, he set fire to Panama; released his prisoners for an immense ransom; and came to the mouth of the Chagnewith the richest booty which any party of Buccaneers had ever acquired. He contributed to have the most valuable part of the spoils conveyed on board his own ship, with which he set sail for Jamaica, before dawn of the day appointed for the general distribution, without having given any warning to the rest of his fleet.

After this treacherous act, no expedition of consequence was undertaken by the Buccaneers, till they were conducted by Van Horn, on an enterprise of great daring and importance. This man had served all his life among the French. Himself a stranger to fear, he would allow no symptom of it to appear among his crew. In the heat of engagement, he ranged about his ship, keenly observing all his men; and if any of them betrayed the slightest alarm, he immediately put him to death. This dreadful discipline, while it effectually deterred the faint-hearted from his service, rendered him the idol of the brave. With those whom he approved, he was always ready to share the plunder which he acquired; thus heightening, by his frank liberality, the admiration which his intrepidity naturally commanded. On his former expeditions, which were chiefly confined to cruising, he sailed in a frigate, which was his own property. In his new designs, which required a greater force to carry them into execution, he was assisted by Grammont, Godfrey, Jonque, and Lawrence de Graff, whose exploits had gained them distinguished renown. Twelve hundred Buccaneers joined themselves, on this occasion, to these celebrated captains, and sailed in six vessels for Vera Cruz. They landed, under cover of night, about three leagues from the town, for which they instantly marched without being discovered. By break of day they were in complete possession of the place; and the greater part of the citizens were kept prisoners in the churches, to which they had fled for shelter. At the door of each church was laid a train of gunpowder, to blow up the building; and a Buccaneer stood by, with a lighted match, ready to set fire to it on the least appearance of insurrection. Thus the city was pillaged without resistance; and, after three days, the citizens confined in the churches, who had tasted neither meat nor drink during all that time, agreed to ransom their lives and liberties for 10,000,000 livres, equivalent to L. 437,500 sterling. Half of the money was paid the same day. The other half was levying in the internal parts of the country, when a large body of troops appeared on an eminence; a fleet of seventeen ships at the same time, approaching the harbour. The Buccaneers thinking it prudent to retreat, carried off with them 1500 slaves, as an indemnity for that part of the ransom which remained unpaid. They sailed boldly through the midst of the Spanish fleet, which allowed them to pass without firing a single gun; happy to be so easily rid of such dangerous enemies.

About a year after the return of these adventurers from the Gulf of Mexico, the French and Eng-lish pirates, without any communication with each other, projected an expedition against the country of Peru. Four thousand men embarked in this enterprise; and, had their courage been directed by a skilful commander, they would have wrested from the Spaniards that important country. Instead of acting in concert, they formed themselves into small parties, and, after plundering many rich towns, they continued for some years in the country, giving themselves up, as usual, to riot and debauchery. Many of them fell victims to their excess. Of those who survived, some were shipwrecked on their return, in the Straits of Magellan, and at Cape Horn; and some, who attempted to march by land to the Northern Sea, either lost their lives or their plunder, by falling into ambuscades which were laid for them by the Spaniards. In short, the French and English colonies gained little by this expedition, which had lasted four years, and which had deprived them of their bravest inhabitants.

While these adventurers were ravaging the shores of the Southern Sea, another band of Buccaneers, commanded by Grammont, was committing similar outrages in the North. Campeachy was the object of their attack; where an incident happened, too honourable to the English character to be here omitted. The citadel, after holding out for some time, was abandoned by its defenders. One gun alone continued to annoy the assailants, which, on storming the fort, they found to be served by an English officer, who had determined to expose himself to any danger rather than basely relinquish his post. Grammont knew how to appreciate such courage; he received this brave officer with every mark of distinction, granted him his liberty, with all his effects, and complimented him, besides, with some valuable presents. The conquerors of Campeachy spent two months in pillaging the city and the surrounding country. After burning the city, and demolishing the citadel, which the governor refused to ransom, they returned to St Domingo.

The next achievement of the Buccaneers was the A.D. 1637 capture of the city of Carthagena. Here their bravery was crowned with the most brilliant success, though tarnished with the most atrocious cruelties. Returning home with an immense plunder, they fell in with a fleet of Dutch and English ships, both those nations being then in alliance with Spain. Several of the pirates were taken or sunk, the rest made their escape to St Domingo. This was the last important expedition undertaken by the Buccaneers. The war, on account of the Prince of Orange, which separated the French and English nations; the successful efforts of both nations to engage these enterprising men in the cultivation of land; their prudence in entrusting the most distinguished of the Buccaneers with civil and military employments; and the protection which they both successively engaged to afford the Spanish settlements, concurred to put an end to the society of Buccaneers, certainly the most extraordinary which history records. See Raynal's History of the East and West Indies, vol. iii. Histoire des Avanturiers qui se sont signalés dans les Indes, par Alexandre Olivier Oexmelin. BUCHOREST. See Bucharest.

BUCENTAUR, the name of the splendid state vessel in which the Venetians perform the annual ceremony of wedding the sea. See Venice.

BUCHAN, a district in the north of Scotland, lying partly in the county of Aberdeen, and partly in the county of Banff. The Bullers of Buchan are great hollows in a rock projecting into the sea, on the coast of Buchan. These hollows, which are open at the top, are about 30 fathoms deep, and 50 in diameter. They have three entrances, through which fishing-boats sail without apprehension.

BUCHANAN, George, a celebrated scholar, of whom any country might be proud, and whose name is peculiarly dear to Scotland. Of the very early part of his life we know wonderfully little; and the little that we do know, is not unmixed with conjecture. He was born in the parish of Killearn, and county of Stirling, about the beginning of February, in the year 1506. His father occupied the farm of Mid-Cowen, or the Moss; but through his premature death, and the contemporaneous insolvency of the grandfather, the family, consisting of five sons and three daughters, were left in extreme poverty. The mother, being a woman of spirit and management, made a successful struggle with the difficulties of her situation, and contrived to rear her numerous offspring in a decent and respectable manner. We have it from tradition, that George got the rudiments of that literature in which he ultimately became so eminent, at the public school of Killearn, which was two miles distant from his native place; and we have it from authority not much superior to tradition. (Mackenzie’s Lives of Scotch Writers), that he afterwards went, whether from choice or from necessity we are not informed, to prosecute his youthful studies in the school of Dumfarton. His maternal uncle, James Heriot, perceiving the superiority of his talents, paid him the attention of a kind and liberal patron, and sent him, when he was about fourteen years of age, to the university of Paris, where he improved his knowledge of Latin, acquired the Greek language by his own unaided exertions, and first began to shew and cultivate his poetical powers. He had not been two years at Paris, when his uncle died, and left him in a state of great destitution, the misery of which was aggravated by a severe distemper, induced, it is probable, by disappointment and mortification. This unfortunate event obliged him to return to Scotland. After devoting a considerable time to the restoration of his health, he entered the army, in which he continued for a year, engaged in active and dangerous warfare with England, mingling with enthusiasm in military operations, and preparing himself for giving those animated descriptions of gallantry and fortitude which are to be met with in his History of Scotland. The first campaign, however, in which he served as a soldier, was extremely inglorious; and while no honour was acquired, the hardships which he had to suffer so much affected his constitution, that he was for several months confined to bed. As soon as he had completed his eighteenth year, he went to the university of St Andrews. There he received the degree of Bachelor of Arts, in the year 1525, at which time he was a pauper or exhibitioner. He soon after went a second time to Paris, where he became a student in the Scottish college. There he obtained various degrees of merit; and, in the year 1529, secured, by competition, the procuratorship of the German nation, which was one of the four classes into which the students were divided, and comprehended those from Scotland. But what was of still greater consequence, he there imbibed the spirit and sentiments of the Reformers, which by that time had made considerable progress on the Continent. At the expiry of two years, he was appointed a professor in the college of St Barbe. In that situation, he taught grammar for three years, without receiving, however, any remuneration that was at all adequate to the extent or value of his labours. Indeed, it appears from his elegies, and from the writings of other authors, that the teachers of humanity were at that time in a most wretched condition in point of emolument, and that Buchanan, in this case, experienced only what was common to all who held that honourable and useful office. In the year 1532, he became tutor to Gilbert Kennedy, Earl of Cassilis, to whom he inscribed his first work, a Translation of Linacre’s Rudiments of Latin Grammar, and whose conduct in after life reflected no small credit on the abilities and virtue of his preceptor. With this young nobleman, Buchanan returned to Scotland in 1537. Having spent some time in his native country, during which he quarrelled with the Franciscan friars, in consequence of a satirical poem, entitled Somnium, he determined to go back to France, and betake himself to his former employment; but James V. retained him as preceptor to his natural son James Stuart, who died in the year 1548. The Franciscans, whom Buchanan had deeply offended, and whose favour he shewed no inclination to regain, endeavoured to make the king his enemy; but so far were they from succeeding in this attempt, that James, who had no reason to love them, only instigated the poet to make fresh attacks upon their principles and character. In his Franciscanus, he exposed their ignorance, their irreligion, and their vices, in a strain of such appropriate and masterly ridicule, and in language so powerful and captivating, as to render him, ever after, the object of their unqualified hatred and resentment. Very soon, indeed, they tried to sacrifice him to their vengeance, by comprehending him in the general arrest to which many Luthers were then subjected, and giving him over to trial and punishment for his alleged heresies. But he had some friends at court by whom he was warned of his danger; and, though Cardinal Beaton was his active and zealous enemy, he fortunately escaped from the apartment in which he had been confined, and succeeded in getting to London, where he was protected from the hostility of the Papists by Sir John Rainsford, to whom he has gratefully inscribed a small poem. In London, however, he did not remain long. His spirit was too proud to brook the necessity under which his indigence had laid him, of practising literary mendicity; and his love of freedom was too ardent to admit of much attachment to a country in which the monarch was a capricious, unprincipled, and cruel
Buchanan's mind, as it declaims boldly against priest-
craft and tyranny, and inculcates, throughout, the
love of civil and religious liberty.

While in Bourdeaux, Buchanan wrote various o-
ther poems, and particularly devoted one to the laud-
able purpose of securing the substantial patronage of
Olivier, chancellor of the kingdom, to the college
of Guienne. In this he succeeded, and then inscrib-
ed an elegant tribute of gratitude to the chancellor
for his liberality. He also addressed a Sapphicide
to the youth of Bourdeaux, in order to recommend
them to the study of the liberal arts; and in this al-
so, he appears to have attained his object. Having
to the best instructions, united the most brilliant and
winning example, he at once stimulated to the pur-
suit, and promoted the acquirement, of elegant lit-
erature.

After residing for three years at Bourdeaux, Bu-
chanan went to Paris, where he officiated as a regent
in the college of Cardinal le Moine till the year 1547.
It appears from one of his elegies, that for a con-
siderable time he was dreadfully afflicted with the gout.
The elegy, however, in which he records the fact,
shews that the disease had not impaired the vigour of
his imagination. His associates in this new situa-
tion, were worthy of being connected with him; and
it has been remarked, that humanity was taught
in the same college, at the same period, by three of
the most learned men in the world,—Turnebus, Bu-
chanan, and Muretus. From Paris he went to Co-
imbra, where the king of Portugal had lately estab-
lished a university; and there he had for his col-
leagues, Govea, to whose friendship he had been
formerly indebted,—Gelida, Tevius, and many other
celebrated scholars. Govea, however, dying unex-
pectedly in 1548, and the protection which he had
hitherto afforded to his learned coadjutors being of
cause withdrawn, they were most bitterly persecu-
ted by the Portuguese. Buchanan, in particular,
was marked out for a victim. The most foolish and
unjust accusations were preferred against him. Two
individuals formally deposed to his being iminsic to
the Romish faith. It was known that he had writ-
ten a poem in ridicule of the Franciscans, and, be-
sides some unchristian notions concerning the Eucha-
rist, he had been guilty of a crime no less heinous
than that of eating flesh in Lent. In these circum-
stances, it was wonderful that the Inquisition, be-
fore which he had been brought, permitted him to
escape with his life. The termination, however, of
that harassing trial to which he had been subjected
for a year and a half by the inquisitors, was neither
severe nor unfortunate. He was sentenced to be
confined in a monastery, that he might enjoy the
privilege of being edified by monks, much more igno-
rant of religion than destitute of kindness. Un-
der their tuition, he continued for several months,
and it was during that period that he commenced
his beautiful version of the Psalms of David—a task
which some allege was imposed upon him as a pe-
nance by his ghostly instructors, but which, it is
more probable, he imposed upon himself, for the
purpose of solacing his pious spirit amidst the evils
of his condition. Whatever was his motive for be-
ginning this work, it is certain that he has accom-
Buchanan.

As soon as Buchanan regained his freedom, he determined to set out for France, to which country he seems to have cherished a warm and constant attachment, and solicited the king for a sum of money sufficient to defray the expense of his journey. The king was unwilling to part with him; and, in order to induce him to prolong his stay, bestowed upon him a small supply, and made him a promise of future and suitable preferment. The supply being little, and the promise of very doubtful performance, he embarked at Lisbon, and arrived safe in England. There, however, he did not long remain. The aspect of political affairs was very discouraging; and though he might have received such promotion as would have pleased other men, yet at that time his affection was so strongly placed on France, that he almost immediately (1553) departed for that favourite land. The French nation were fond of him, and considered him in some measure as their own; and the warmth and extent of his attachment to them may be seen in a poem written by him on this occasion, entitled *Advenit in Galliam*, in which he praises the country for every thing that is beautiful in nature, liberal in art, refined in manners, and great in arms. Soon after his return to Paris, he was made a regent in the college of Boncourt. In the year 1555, he became preceptor to Timoleon de Cosse, son of the celebrated Comte de Brissac, who at that time was invested with the government of the French dominions in Italy. Marshal de Brissac was a great warrior, but of liberal sentiments, and fond of the society of learned men. Buchanan resided in his family for five years, conducting himself with his accustomed propriety, and at once instructing the son in the elements of literature, and assisting the father with his counsel, and delighting him with his conversation. A civil war breaking out in France, Buchanan returned in haste to his native country. There he was employed at court (1562) as classical tutor to Queen Mary, who was then in her twentieth year; and we find, by a letter of Randolph's, that he read with her, every afternoon, a portion of Livy; a circumstance which places in a very respectable light the attainments of that accomplished but imprudent and unfortunate princess.

Buchanan arrived in Scotland just about the time (1566) when the reformed religion had triumphed over Popery, and obtained the sanction of parliamentary enactment. To that religion he had all along been secretly attached; and though his attachment was founded on a rational conviction of its superiority and truth, he himself acknowledged that he was much confirmed in his principles by the treatment which he had received from the grey friars. He accordingly professed himself an adherent of the new doctrines. His accession to the number of the reformed was considered as of sufficient importance to merit their best regards; and by the Earl of Murray, who was not only one of them, but a patron of learning and of learned men, he was appointed principal of St Leonard's college in St Andrew's. In consequence of holding this office, he was obliged to prelect on theology; and it is recorded, that his prelections were those of a man who had studied his subject, and that they displayed the characteristic ability of their author. He had not been long in Scotland, when he thought of publishing a correct edition of his various poetical works. His version of the *Psalms* being now completed, he put it into the hands of the celebrated printer Henry Stephens, who kept the manuscript so long beside him, that he has been accused of a design to claim it as his own, in the event of Buchanan's death. This accusation, however, does not appear to have been well founded. The work at length appeared, and excited universal admiration. Several attempts were made to give a Latin version, or rather paraphrase of the *Book of Psalms*; but though some of these, particularly that of Arthur Johnston, possess great merit, and in certain points may be considered as equal, if not superior, to the production of Buchanan, it is the general and established opinion, that, on the whole, he is quite unrivalled. Even of *Johnston's Psalms*, we seldom hear; but *Buchanan's Psalms* are known to, and spoken of by, every scholar in Europe. This elegant work the author inscribed, in a poetical dedication no less elegant, to Mary, whose studies he was probably superintending at the time. The queen rewarded him for his merits and for his compliments, by conferring on him the temporalities of the abbey of Crossraguel, which were very considerable. He also published a collection of satires, entitled *Fratres Fraterrimi*, which had been composed at various periods, and were chiefly directed against the doctrines of the Popish church, and the licentiousness of the Popish priests. By these effusions of wit and ridicule, he certainly promoted the cause of the Reformation. The abettors of that cause were encouraged by the efforts of such an able friend; and its adversaries were put to silence and to shame, by a weapon which the very nature of their superstition, and the notorious practices of their clergy, made it impossible for them to resist. In the year 1567, he published another collection, containing *Elegiae, Silva, Hendecasyllabi*.

As Principal of St Leonard's College, Buchanan was regarded with the highest reverence and esteem: in proof of which, various marks of honour were conferred upon him. He was also repeatedly a member of the General Assembly. Of that court, in 1567, he had, though a layman, been chosen moderator; and he was formerly one of the commissioners appointed for revising the Book of Discipline. But Buchanan was now to appear in a new character, and to take an active and decided part in the politics of his country, which at that period were in a very disordered and critical state. The first transaction in which he engaged, was one of a nature equally extraordinary and delicate. Elizabeth having required delegates to be sent from Scotland for the purpose of conferring with respect to the conduct and situation of Mary, who was then a prisoner in England; and Murray, the Regent, with other distinguished persons, having gone on that embassy, Buchanan was one of several who were
appointed to accompany them as assistants. He became a powerful co-adjustor, by composing a work, in which he endeavoured to detect and expose the wicked actions of the Scottish Queen. This work was submitted to the commissioners during their conference at Westminster, (1568), and was afterwards circulated most industriously through the kingdom by Elizabeth and her ministers. This part of Buchanan's conduct has been severely condemned by Chalmers, Stuart, and other writers of the same stamp, who have broadly accused him of the foulest and most aggravated ingratitude to Queen Mary. The benefits conferred upon him by that princess have been much exaggerated, in order to render his alleged misconduct the more glaring and unpardonable. One thing is certain, that he was not patronized or promoted beyond his real merit and his professional services. But even allowing the greater part of what has been asserted on that point to be true, the charge of ingratitude is not necessarily substantiated. Buchanan, doubtless, was placed in circumstances which must have been painful to an ingenious mind, and which it is to be presumed were painful to his. There was a contest between private feeling and public duty; and had Buchanan been a man of narrow views, or sentimental imbecility, he would have preferred the claims of the former to the obligations of the latter: but as he thought vigorously, and felt nobly, he merged what he owed to an individual in what he owed to his native country; and that he might do a service to the cause of humanity, and religion, and freedom, (for all these were believed to have been violated by the queen), he was contented to lie under the suspicions and to suffer the obloquy to which his patriotism might expose him. It should not be forgotten, that he did not abandon his queen till she had openly renounced those principles and virtues, by the exercise of which alone, she could justly expect his allegiance and support. When Murray, to whom he was strongly attached, was assassinated (1570) by Hamilton of Bothwellhaugh, Buchanan, feeling the keenest indignation against the family of the assassin, and suspecting that their bloody purposes were not yet fully executed, wrote an admonitory letter on the subject, "Direct to the true Lords, Mantenaris of the King's Graces Authoritie." During the same year, he wrote a satirical tract in the Scottish dialect, entitled, "The Chameleon," in which he exposed, with great success, the unsteadiness of Secretary Maitland's political principles and conduct. This production, however, was suppressed at the time, by the vigilance of the secretary, and indeed was not printed till the beginning of last century. Very soon after the death of Murray, Buchanan was nominated to be one of the preceptors for conducting the education of the young king, who was then only four years of age. This very delicate and important office, he executed with his characteristic talent and integrity, communicating to his royal pupil the classical knowledge which he was so well able to impart; instilling into his mind those sentiments which became his station and his destiny; and fearlessly subjecting him to that discipline which the prospect of a crown generally renders more necessary than agreeable. James, who in some respects profited considerably by Buchanan's tuition, long remembered the commanding aspect and authoritative manner of his preceptor; but that monarch did not realise the anticipations which Buchanan had fondly cherished of his reign, and permitted the liberal and enlightened sentiments which had been inoculated upon him with the utmost solicitude, to be superseded by an inordinate love of prerogative, or impaired by a sily resentment against his preceptor for his treatment of his unworthy mother. At the same time that Buchanan became preceptor to the king, he was made a director of the chancery; and, in 1570, he was invested with the office of keeper of the privy seal, in room of Lord Maitland, which office he appears to have held so late as the 1580. While Buchanan acted the part of a politician and a statesman, he continued to act also as a scholar; for we find him occupied, by special appointment, in composing suitable grammars for the use of schools, which then laboured under great defects in that important particular. He afterwards employed his pen in drawing up a memorial respecting the reformation of the University of St Andrews, in pursuance of a commission granted by the parliament in 1578, for reforming all universities and colleges within the realm. About this time, it is evident, that Buchanan stood uncommonly high in the estimation, not only of his own country, but of the world at large. He corresponded with the most eminent literary characters of the age. He was applied to by the King of Navarre, and other zealous Protestants on the continent, to promote the reformation, by using his influence with the monarch and people of Scotland. And some distinguished critics abroad solicited him for contributions to their editions and illustrations of the ancient classics—a department of literature to which he had not paid much attention, but in which his natural sagacity, and his extensive learning, certainly qualified him to excel.

His correspondence, it is evident, was very extensive, but unfortunately a very inconsiderable proportion of it has been preserved. A small volume is all that remains, to which there is no prospect of any augmentation. Notwithstanding the many avocations which consumed so much of his time, and the infirm and precarious state of his health, Buchanan had found leisure to compose a treatise of political philosophy, under the title "De Jure Regni apud Scotorum Dialogus." It was published in 1579, and dedicated to the young King, his pupil. The subject, as announced in the title, is local and limited; but, as discussed in the body of the work, embraces the general maxims and principles of government, which the author lays down with much precision, and expatiates upon with much eloquence. This book excited a great deal of attention, and procured for Buchanan high applause from the friends of liberty, and most bitter hostility from the abettors of popery and despotism. When Buchanan reached the 74th year of his age, he drew up a short account of his life. It is characterized by elegance, simplicity, modesty, and candour.

The last work which he completed was his History of Scotland. It issued from the press in the
Buchara. year 1582. With this admirable production, every
scholar is acquainted. Of its classical merits, no
doubt can be entertained. Some, who must be con-
sidered as among the most competent judges, have
not scrupled to prefer it to the elegant productions
of Livy. As a history, it has some faults, but these
are far more than counterbalanced by its excellencies;
and although the author's political leanings, and his
occasional attachment to fable, have subjected his
authority to a degree of doubt and suspicion; yet
the more his material facts have been investigated,
the more reason has appeared for confiding in his
correctness and veracity.

A short time before his death, Buchanan was vi-
sited by some learned friends, and they found him
employed in teaching the hornbook to a young man
in his service! They held some conversation with
him, chiefly respecting his History, which was then
in the press, and which they thought contained some
dangerous passages. In the course of conversation,
he exhibited that firm regard to truth, and that un-
daunted boldness in stating it, by which he had been
long distinguished. He expired on the 28th of Sep-
tember 1582, in the 77th year of his age, and was
interred in the burying ground of the Grey-friars.
For more particular information concerning this ce-
lebrated character, the reader may consult Bucha-
nan's Life, written by Himself, and the various
publications referred to at the end of Dr Irving's
Memoirs of the Life and Writings of Buchanan,—
very a able and interesting work, and much less
known than it deserves. (r)

BUCHARA, BOKHARA, or BOGAR, a city of
Asia, in Great Bucharia, from which that country
derives its name, is situated on the river Sogd, about
100 miles west from Samarcand. It stands on a ri-
sing ground, and is surrounded with a slender wall of
earth. It is large and populous, and divided into
three quarters: The Khan, with his Tartar court,
habits the one; the officers of the court, and other
servants of the prince, another; and the third, which
is by far the most extensive, is occupied by the citi-
zens, merchants, and other inhabitants. This last is
also subdivided in such a manner, that every trade has
its particular department. The houses are low,
and composed chiefly of mud; but the mosques,
baths, and other public buildings are of brick, and
well built. This city was anciently distinguished for
its arts and sciences; and it is even maintained by
some, that it received its name from this circumstance:
Buchara signifying, in the Mogul language, learned;
and Bucharia, the country of the learned. Its uni-
versity was frequented by students from every part
of the Mahometan dominions, where they were in-
structed in every branch of literature; but particu-
larly in the theology of the Moslems. From the si-
tuation of Buchara, it soon rose to be the chief em-
porium of commerce in this country. It was the
resort of merchants from India, Persia, Turkey, Rus-
sia, and Poland; and its warehouses were filled with
Oriental and European merchandise. But since the
subjection of Buchara by the Upbeck Tartars, it
has greatly fallen from its ancient opulence. Its com-
merce has languished under the oppression of its ru-
lers; and it is now visited by few foreign merchants,
on account of the extraordinary extortions to which Bucharest
they are exposed from the Khan and his officers. Its
manufactures are soap, cotton-yarn, and calico, which,
with the produce of the surrounding country, as
cotton, lamb-furs, down, rice, and cattle, they ex-
port to Persia, and receive in return, velvet, silk,
sashes, cloth, indigo, coral, and cochineal. But its
cine linens, for which it was so famous in the tenth
century, are now unknown. During the invasion of
this country by Zengis Khan, Buchara, which was
then strongly fortified, endured a protracted siege of
nearly twelve months, which so exasperated the Mo-
gul, that, after its surrender, he set fire to the city,
which, being chiefly constructed of wood, was redu-
ced to ashes, and nothing of it was left, but the sul-
tan's palace and a few houses, that were built of
stone. After continuing some time in this desolate
state, Zengis ordered it to be rebuilt a little before
his death. It is now the residence of the Khan of
Buchara, who is a despotic prince, but whose power,
however, reaches but a little way without the city.

BUCHAREST, BUCHOAREST, or BUCAREST,
a town of European Turkey, in the province of Wal-
lachia, is situated on the river Damboriza, and is the
residence of the Hospodar, or prince of Wallachia,
and the see of a Greek archbishop. It shows at a
distance numerous cupolas, and a vast extent of
buildings; but it consists merely of a collection of
villages, without plan or regularity. The houses
are very mean in general. The best of them are built
of stone, and covered with wooden tiles; and when
Mr Chissul visited Wallachia in 1702, the greater
number were under ground like cellars, and covered
at the top with straw, or bark of trees. The gar-
dens are very wide, and enclosed with entire trunks
of oak, set closely together. The streets are paved
transversely with planks of wood, about ten yards
long, and as many inches thick, and appear like one
continued bridge throughout the whole extent of
the city. The planks are often badly fastened, and much
decayed, which renders walking very disagreeable
and tedious. This town is said to contain 400 con-
vents and churches; the principal of which are, the
patriarchal church adjoining the palace of the arch-
bishop. It has four cupolas, and stands on an emi-
nence, commanding a pleasant view of the city. The
church of St George, the patron saint of Wallachia,
is built in the best modern Greek style. Its portico
is supported by short spiral columns, with an imita-
tion of Corinthian capitals; and the interior walls
are spread over with fresco paintings of saints, par-
ticularly of the equestrians, St George and St De-
metrius, as large as life. The palace of the Hospo-
dar has a very mean appearance. It is low, and
built of wood, with slated towers over the gate-
ways; and stands in a court, which also contains a
church, and a range of barracks. The meaness of
this establishment is easily accounted for, by the fre-
cquent changes of its inhabitants, who are little anxi-
ous about present conveniences and splendour du-
ring their short and precarious government, provided
they can amass enough of wealth from their tempo-
BUCHARIA, or Bokharia, a country of Asia, and part of Independent Tartary, is bounded on the north by the river Sirr and the mountains of Argun; on the west by Kharism, Chorsan, and the desert of Margiana; on the south by the Gaur and Hindoo Koh mountains, which separate it from Persia and Hindostan; and by the chain of Belur Tag, which separates it from little Bucharia, on the east. It lies between 35° and 43° of N. Lat. and 69° and 73° of E. Long, and is supposed to comprehend the Sogdiana and Bactria of the ancients, with their dependencies. The northern part of it, also, corresponds with the Maweralnahr of the Arabians, which signifies the country beyond the river, and is the same with the ancient Transoxiana. Bucharia contains the kingdoms of Samarcand, Balk, and Bucharia properly so called; each having a town of the same name, except Bucharia, whose capital is Buchara, from which the country takes its name. There are, however, other divisions, many of which, though included in these kingdoms, are subject to separate governments. Towards the north, are the provinces of Fergana, Osrushna, and Sogd; towards the east, Vaah, Kotlan, and Kilan; and on the south, Gaur, and Tokareston. Of these, Fergana is subject to the Krgyzes, and Gaur to the king of Cundahar. This country presents an agreeable variety of hill and dale. The mountains are lofty and extensive, and the plains are plentifully watered by the Amu and the Squir, with their tributary streams. The Amu, or Jihon, the ancient Osus, has its source in the Belur mountains, and directs its course towards the south-west passes by Badakshan and Termed, after receiving numerous streams from the mountains of Ak-Tau, on the north, and Hindoo Koh on the south. When it leaves the latter city, it turns towards the north-west, and being joined by the Dehash, Sogd, Morgab, and Kizil Dara, it falls into the sea of Aral, after a course of nearly 900 miles. The Squir, or Sash, sometimes called the Sihon, rises in the mountains of Terek Daban, or northern part of the Belur chain, and taking nearly the same direction as the Amu, washes the cities of Andegan, and then traversing the desert of Burzuk, it falls into the eastern side of the Aral. During its course, which is about 350 miles, it receives many tributary rivers; and it is supposed by some that it is joined by the great river Sarau from the north; but so imperfect is the geography of this country, that the direct course of that river is yet unknown. Great Bucharia is the best cultivated and most populous region of Independent Tartary. It is inhabited by three distinct nations; the Buchars, who were its original inhabitants; the Moguls, who established themselves here under Zagata, the second son of Zengis Khan; and the Usbeck Tartars, who are now its actual masters.

The Buchars are a quiet and inoffensive race, composing the principal population of the towns and cities, and employing themselves entirely in trade and commerce. They never interfere with war, but content themselves with conscientiously paying the taxes for its support; on which account they are despised by the Tartars, and treated as a debased and pusillanimous people. They are, however, far superior to the Tartars in manners and appearance. They are, in general, tall, elegant, and well made, with black hair, and an open lively countenance. The women are also well shaped, with fine complexions and beautiful features. Their garments correspond with their peaceful dispositions; a long calico robe, reaching to the calf of their leg, over which they wear a vest of quilted silk, and tied round the middle with a silk girdle or sash; trousers, with light boots like Persian buskins, and a turban, or round cloth bonnet, bordered with fur, constitute their dress in summer. In winter, they are covered with a long cloth gown, lined and trimmed with fur. The robes of the women are full and loose; their bonnets small and coloured; and their hair hangs in long tresses, and is decorated with ribbons and jewels. The Usbeck and Mogul Tartars, on the other hand, are clothed for war. Their dress is short, and adapted for exercise. They are the most robust and warlike of all the Tartars, and are continually engaged in hostilities with the Persians. The dart, the arrow, and the spear, were formerly most formidable weapons in their hands, but they are now accustomed to the use of fire arms. They, however, still wear coats of mail, and sometimes a shield, to defend themselves from the sabre. Their wives are equally brave and hardy. They often follow their husbands to the field of battle, and undauntedly mix in the slaughter. Their food consists of boiled rice and horse-flesh, and their usual beverage is _kumis_ and _aral_, which are both extracted from mares milk. The summer is spent in predatory excursions, or in wandering over the country, pitching their tents wherever the herbage is most luxuriant; and in winter, they retire to the towns and cities. Such of them as are employed in agriculture, live in villages and hamlets. The Tartars are governed by khans, whose power is despotic. The chief of these are the khan of Balk on the south, and the khans of Samarcand and Buchara on the north. The authority of the latter, however, was, according to Hasaway, confined, in 1741, to
The inhabitants of this country have been highly extolled for their hospitality and generosity; and such is their disposition in these respects, that no opportunity is omitted of performing kind offices to strangers, and every peasant keeps a portion of his cottage, however small, for the reception of a guest. "I happened once to be in Sogd," says Ibn Haukal, an Arabian traveller, "and there I saw a certain palace, or great building, the doors of which were fastened back with nails against the walls. I asked the reason of this, and they informed me that it was a hundred years and more since these doors were shut; all that time they had continued open day and night; strangers might arrive there at the most unseasonable hours, and in any numbers, for the master of the house had provided every thing necessary, both for the men and for their beasts; and he appeared with a delighted and joyful countenance when the guests tarried awhile;—and you cannot see any town or stage, or even desert, in Mawer-alnahr, without a convenient inn or stage-house for the accommodation of travellers, with every thing necessary." This flattering description, however, does not at all correspond with the accounts which we have of its present state; and we are afraid that it must be confined to an early part of its history, while one sovereign possessed the sole dominion of the country, and before the liberty of its inhabitants was extinguished, and their industry paralysed by the oppression of their conquerors. The Mahometan Tartars who possess Bucharia, have little to distinguish them from the most savage tribes. War and plunder are their chief employments, and slavery is practised among them in all its horrors. Expeditions are often undertaken for the sole purpose of procuring slaves, which they either keep in their service, or sell to their neighbours; and this commerce is carried to such a length, that they will frequently rob another of their children to sell them, or even dispose of their own. If they are weary of their wives, they sell them, without ceremony, to the highest bidder, and do the same with their daughters, particularly if they are beautiful. In short, they are indolent, perfidious, and cruel.

The climate of Great Bucharia is excellent, and preferable to any in the same latitude; the heats of summer being tempered by the breezes from the mountains with which it is surrounded, and whose lofty tops are continually covered with snow. The soil is equally favourable, and capable of producing every species of grain and fruits in the richest abundance. According to Ibn Haukal, the districts of Bucharia and Sogd constitute the most delightful country in the world; and from the Kohendiz, or ancient castle of the city of Buchara, such a scene of luxuriant and beautiful verdure presents itself on every side, that the spectator would imagine that the green of the earth was united to the azure of the heavens. "The walls and buildings and cultivated plains of Bucharia," says the same Arabian, "extending above thirteen farsang by twelve, and the Sogd for eight days journey, is all delightful country, affording fine prospects, and full of gardens, and orchards, and villages, corn fields, and villas, and running streams, reservoirs and fountains, both on the right hand and on the left. You pass from corn-fields into rich meadows and pasture-lands, and the fruits of Sogd are the finest in the world."

Nature has refused nothing to this fine country that can render it a most agreeable place of residence. The valleys are exceedingly fertile in all kinds of fruits and herbs; the rivers are abundantly stocked with excellent fish; and wood, which is in general such a scarce article throughout Great Tartary, is here as common as in most other countries. "In one word," says Bentick, "it is the richest soil in all Northern Asia; but few of its advantages can be appreciated by its Tartarian inhabitants, whose idleness is so excessive, that they would rather undertake a pillaging excursion into the territories of their neighbours, than bestow a moderate portion of their labour on the cultivation of those gifts which nature has so liberally conferred upon them. In some parts, however, rice and other grains are cultivated to a considerable extent, but agriculture in general is here very imperfectly understood. From this circumstance, very little corn is produced in Bucharia. The most fertile parts of the country being always in pasture, upon which they rear an immense quantity of sheep and horses; and, according to Pallas, 10,000 horses, and 60,000 sheep, from this country, are annually sold at Orenburg, in Russia. Most of the mountains of Bucharia abound with the richest mines. Those of Badakshan, in the province of Balk, produce baly ruby, lapis lazuli, amianthis, and the precious metals; those of Fer-gana, vitriol, iron, copper, quick-silver, gold, and turkois. The inhabitants, however, have neither perseverance nor industry sufficient to profit by them, but content themselves with gathering the grains of gold and the precious stones which have been washed down by the torrents from the mountains when the snow melts in the beginning of summer.

Commerce is chiefly confined to the Buchars, who have always been considered as a trading people. They carry on a considerable traffic with China, Russia, Tibet, the Calmucks, and Mongales; and their caravans travel through the whole continent of Asia. Commerce, however, is very much shackled by the tyranny of the khans and their officers; and what is still more detrimental to it, their caravans are continually exposed to the attacks of the wandering Tartars. But notwithstanding these impediments, they find their way to most of the capitals of the neighbouring kingdoms. They have several establishments in the southern provinces of Russia, with which they maintain a constant communication, and not only furnish them with their own products, but also with the merchandize of the eastern countries with which they trade. They send thither gold and silver, chiefly in Persian coins and Indian rupees; gold dust, precious stones, lapis lazuli, cotton stuffs, half silks, nitre, sal-ammoniac,
rhubarb, and great droves of sheep and horses; for which they receive in return, cloth, leather, hardware, beads, indigo, cochineal, and furniture for their horses. To Pekin they carry large cornelians of a beautiful red colour, rough diamonds and other kinds of jewels, also gold dust and musk; which they exchange for fox and beaver skins, sable and other furs, damasks, cotton, and European cloths. They buy also tea, tobacco, and great quantities of earthen ware. The towns of Bucharia are also frequented by the merchants of Russia, Persia, India, and the northern provinces of China; but the merchandise which they bring there is very considerable, and they sometimes even remain two years before it is disposed of. Persian coins are current in this country, and the highest piece of money that is struck in Bucharia, is the tanga, equal nearly to a crown of our money. It is of very fine silver, round, having the name of the khan on the one side, and on the reverse the name of the country, with the year of the hegira. The other coins are small brass pieces of different values.

The early history of this country is involved in great obscurity and uncertainty, particularly for some centuries after its subjugation by the Scythians; and for an account of the transactions in which it was engaged before that period, we refer our readers to the articles Bactria and Sogdiana. The Scythians first took possession of Bucharia about 1200 years before the Christian era; and their kings held the dominion of this country during the reigns of the Roman Emperors Adrian, Antoninus Pius, and Valerian. They were, however, expelled in their turn, by a division of the Huns, who, being driven from their native seats in the north, by the arms of the Sicupi and the policy of the Chinese, sought in the western world for some remote country, inaccessible to the power of their inveterate enemies: (See Huns.) Before the end of the first century, they had established their dominion in Sogdiana, where they still preserved their original appellation, with the epithet Ephthalites, or Nephthalites. By a long residence of twelve centuries in this mild and fertile country, and by their conversion to the religion of Islam, their manners had been softened, and their features insensibly improved; and the white Huns, as they were called, from the change of their complexions, had forgot the servitude and the pastoral life of their ancestors. Their king lived in all the splendour, and enjoyed all the authority of an eastern monarch, and his power extended from the Persian Gulf to the borders of India and Turkistan. Wealthy and populous cities pervaded the whole of Maweralnahr, and supplied him with a powerful army; and their bravery and discipline established him the first of the Moslem princes. But in the beginning of the thirteenth century, the pride and cruelty of Sultan Mohammed hastened his downfall, and the destruction of his country. A caravan of three ambassadors, and one hundred and fifty merchants, had been dispatched by the great Zengis, Emperor of the Moguls, to establish a friendly and commercial intercourse with the sovereign of Bucharia. His offer was rejected with scorn, and his caravan arrested and murdered at Otrar, by the command of Mohammed. Zengis knew the strength and discipline of his enemy; and it was not till after a demand and denial of justice, that he determined to revenge the insult offered to his person and to his subjects. Seven hundred thousand Moguls advanced to the reduction of Bucharia, and encountered on the plains of Turkestan the army of Mohammed, consisting of 400,000 Moslems. The first battle was suspended by the night; but the Moslems were routed, with the loss of 160,000 soldiers. The native fierceness of the Moguls was exasperated by the pretence of justice, and the incensed Zengis indulged the rapine of his followers. The strongest cities were unable to withstand their fury. They overran and desolated a tract of many hundred miles, adorned with the habitations and labours of the Bukharians; and the country received the name and the dominion of Zagatai, the second son of the Emperor Zengis.

For more than a century, the successors of this prince reigned in Bucharia; but the extinction of the royal line, and the domestic feuds of the emirs, offered their country an easy conquest to the khan of Cashgar, who, with an army of Calmucks, soon established his dominion in Maweralnahr. His success, however, was but of short duration. Tamerlane had appeared at the head of the Bukharian emirs, and, after expelling the Calmucks from his country, was invested, in a general diet, with the imperial command, and seated on the throne of Zagatai. In secure possession of a great empire, Tamerlane disdained the repose of peace; and though he laboured to cultivate and adorn the country of his birth, yet the restless energies of his mind found their suitable employment only in desolating and subduing the nations of the earth. He soon united to his empire the countries of Kharism and Candahar, and turning towards Persia; he did not stop until he had reduced twenty-seven kingdoms to his authority, and established Samarcand the first capital of the world. Indulging in a short repose from the toils of conquest, he employed his riches in the building of palaces and temples, and he displayed his magnificence and power to the ambassadors of Tartary, India, Egypt, Arabia, Persia, and Spain. But China was still unsubdued; and the aged monarch, with a select army of 200,000 veteran soldiers, again unfurled his standard for the invasion of that distant kingdom. The severity of winter could not retard his departure. He passed the Sihon on the ice, and after marching 300 miles from his capital, pitched his camp for the last time in the neighbourhood of Otrar. A fever, with which he had been seized on his journey, was accelerated by cold and fatigue, and the conqueror and scourge of Asia expired in his tent, in the seventieth year of his age. His death arrested the expedition; China was saved; and with his life expired the glory of Samarcand. His children were unable to uphold such a mighty empire. They soon became the enemies of each other, and the oppressors rather than the protectors of the people; and before the end of a century, the descendants of Tamerlane were expelled from Bucharia by the Usbeck Tartars, who, in 1494, founded a powerful monarchy in that country. Successive princes wielded the sceptre from 1494 to 1659, when this extensive and fertile kingdom was soon after broken into several governments, under nu-
Bucharia.

The principal cities of Bucharia are: Samarcand, Buchara, Balh, Badakshan, Omskusha, Kotlan, Termed, Anderab, and Gaur. See Peucctet Dictionnaire, &c.; Pinkerton's Geography, vol. ii. p. 408; Re-
cueil de Voyages au Nord, tom. x. p. 127; and Gib-

BUCHARIA, (Litteral,) a country of Asia, formerly called the kingdom of Cashgar, and suppos-
ed to be the Sereis of Ptolemy, and the Seuthia ex-
tra Ismaum of the ancients. It received the name of
"Little," not from its being less extensive than Great
Bucharia, but from its being much inferior to that
country, both with regard to its soil, its climate, its
population, and the number of its cities. It is almost
surrounded with mountains and deserts. On the west,
it is separated from Great Bucharia by the moun-
tains of Belur; on the north, from Songoria and
the Calmuck Tartars by the Altaian mountains; on
the east, from the empire of China and the Elities
of Kostor by the desert of Cobi; and from Tibet,
the south, by the mountains of Mus Tag. It ex-
tends about 1000 British miles in length, and its
greatest breadth is nearly 500; being comprehended
between 36 and 44 degrees of north latitude, and 70
and 88 degrees of east longitude. This country,
when visited by Coez, was divided into two king-
doms; that of Cashgar on the west, and Chialash on
the east; but these states compose only the northern
and western parts of Little Bucharia; and the sou-
thern parts contain several large provinces, such as
Koten and Karia, the former of which is represented
by Strahlemberg as an independent kingdom. Wha-
ever is said, however, concerning the geography of
this part of Asia, must be received with very great
allowance; for neither its extent, its divisions, nor its
population, nor even the names of its cities, and the
sources and course of its rivers, have ever been as-
certained with any degree of accuracy. Its principal
rivers are: Yarkand, which is represented as issuing
from Loch-nor Lake, and passing through the de-
serts, nearly in a straight line of not less than 500
English miles, and supplying several branches, as the
Koten, Orankashi, &c.; the Chaidu, which proceeds
from the same lake; and the Karia, which has its
source in a lake in the desert of Sultus.

From the general elevation of the land, and its
lofty mountains, rising from the midst of sandy de-
serts, this country resembles a sea interspersed with
rocks and islands; and though the climate is much
colder in winter than might be expected from its la-
titude, yet, in summer, the heat is so concentrated by
the surrounding mountains, that out of doors it can
scarcely be endured. The soil is in general barren,
though interspersed with some fertile vallies, which
produce cotton, hemp, flax, vines, and various kinds
of fruits; and the mountains are rich in gold and sil-
ver mines, but both the Calmucks and Buchars are
equally ignorant of the method of working them, and
content themselves with gathering the gold dust which
is washed down by the rivers, and with which they
carry on a trade with India, China, and Siberia. This
country also abounds with diamonds and other pre-
cious stones, but as the inhabitants have not the art
of cutting or polishing them, they are sold in their
rough state. The Calmucks, who wander about this
country, live in tents, and almost entirely upon the
produce of their cattle (See CAlMUKS); and the
Buchars, who compose the greatest part of its popu-
lation, inhabit the cities, and employ themselves in
trade and merchandise. These differ very little from
the inhabitants of Great Bucharia. Their manners,
their dress, and their appearance, are nearly the same,
except that the former are rather of a darker hue, ar-
sing probably from the reflected heat of the sandy
deserts; and the women wear a greater profusion of
ornaments, and dye their nails with henna. Their
habitations are generally built of stone; and their
furniture consists chiefly of trunks plated with iron
which are ranged along the walls, and covered, dur-
ding the day, with mattresses, which at night are re-
moved and used as beds. They use neither tables nor
chairs, but sit cross-legged on the ground, and eat
their meat, which is placed upon a cloth, with their
fingers or wooden ladles. Their food consists chie-
vely of small cakes, composed of minced meat, which
will keep a long time, and of which they make a ve-
ry palatable soup during their long journeys in the
deserts; and their principal beverage is tea, which
they prepare with milk, butter, and salt. Though
the prevailing religion of the country is Mahometan-
ism, yet the Calmucks, who are represented as plun-
ged in the grossest idolatry, allow the greatest tol-
eration; and no person suffers on account of his op-
inions. The Buchars, however, are very superstitious.
Both sexes carry about with them prayers written by
their priests, which they keep in a small purse in the
form of relics. In sickness, the occupation of the
physician is merely to read to the patient a sentence
from some book, to breath on him several times, and
to wave across his face a sharp-edged knife, which is
supposed to cut the root of the disorder. When dead,
the priest lays the Koran on his breast, and recites
some prayers, immediately before the body is interred.
Though polygamy is considered by the Buchars as un-
lawful, yet it very generally prevails. Their wives are
purchased from the father, so that daughters are in
this country a real treasure. All intercourse, however,
between the betrothed couple is prohibited from the
signing of the contract to the celebration of the mar-
rriage; and they are even forbidden to see one an-
other during the performance of the ceremony. The
Buchars are rather a polite and benevolent people,
never intermeddling with the affairs of war or con-
quest, but paying quietly the annual tribute demand-
ed of them by their conquerors. Their principal
commercial intercourse is with China, where they car-
y gold-dust, musk, rough diamonds, and precious
stones, which they exchange for tea, tobacco, and Eu-
ropean cloths. They also export these articles to Per-
sia, and sometimes as far as Tobolsk in Siberia. The
only coin they have is the Kopel, which is made of
copper, and weighs about a third of an ounce; but
all considerable sums are paid in gold or silver, which
they weigh, after the manner of the Chinese and
their other neighbours.

Little Bucharia, in ancient times, was the coun-
try of the "Seres;" but very little is known of its

Rivers.

Bucharia.

history, until its conquest by Zengis Khan, who bequeathed it, along with Great Bucharia, to his son Zagatai; and it continued to follow the fortunes of that country till 1683, when it was conquered by the Calkumites. Under the dominion of their Contais, or Great Khan, the dependencies of Bucharia had extended over the provinces of Turfan and Hami, and east of the desert of Cobi as far as the great wall of China. Of this country they remained in quiet possession until 1715, when the jealousy of the Chinese, and the animosity of the Mongales, were raised by the discovery of a gold mine at the foot of the mountains which separate the territories of the two kingdoms. The Contais had dispatched a body of 10,000 Calkumites to seize upon this treasure; but, being attacked by the Mongales and Chinese, were completely routed, and pursued into the deserts, which they, however, repassed, by certain fertile valleys, scattered among the mountains, which till then had been entirely unknown to their enemies. The Chinese emperor, wishing to profit by his success, sent a powerful army, well furnished with artillery, under the command of his son, attended by a Jesuit of Pekin, well skilled in the science of fortification and gunnery. This prince passed the deserts by the same route which the Calkumites had taken in their flight, and entered the extensive plains of Turfan and Hami; but, being unwilling to risk his army in such an open country, against the cavalry of the Contais, who had advanced to meet him, he contented himself with erecting a chain of forts, which he supplied with cannon and infantry. Under the protection of their forts, the Chinese kept possession of these provinces, without the Calkumites being able to bring them to an engagement. The Contais, who now saw that it would be impossible to drive out the Chinese without the aid of cannon, with which his subjects were entirely unacquainted, was compelled to have recourse to Russia. He offered, in 1720, to pay an annual tribute to that power, upon condition that it would supply him with an army of 10,000 regular troops, well equipped, with cannon, to enable him to meet the Mongales and Chinese; but Peter the Great, who was at that time engaged in a war with Sweden, and also prosecuting his plans of conquest on the side of Persia, was prevented from accepting such advantageous proposals. The Chinese, consequently, remained masters of these provinces, with all the territories of the Contais, east of the desert of Cobi, towards the frontiers of China. The Calkumites, irritated by their losses, became the most determined and dangerous enemies of the Chinese empire; and though its monarch had made repeated visits into Mongolia to overawe their restless neighbours by a display of superior power, yet they continued their hostile ravages whenever an opportunity could be found of harassing their enemies, until they were completely subdued by Kiang Long in 1759, who thus extended the limits of his empire as far as the mountains of Belur.

The principal cities of Little Bucharia are, Cashgar, Yorkand, Koton Karia, Chialash, and Turfan. See Pinkerton's Geography, vol. ii. p. 252; Puchet Dictionnaire, &c.; Recueil de Voyages au Nord.

BUCKINGHAM. See BLEACHING.

BUCKINGHAM, the principal town of Buckinghamshire, is situated on the side and bottom of a hill, on the river Ouse, which winds round the three sides of the town, and is crossed by three stone bridges. The houses, which are chiefly of brick, are ill built, and many of them are thatched. The town consists of one long street, and the buildings are irregularly scattered over a large space of ground. The principal public edifices are, the church and the town hall. The former of these is erected upon the summit of an artificial mount, which was formerly the site of a castle. This elegant fabric, which was begun in 1777, and finished in 1781, at the expense of L.7000, is built of stone, and the beautiful square tower attached to its south-west end, is adorned with pinnacles and embrasures, and with a light tapering spire 150 feet high. The old church fell in 1776; its spire, which was the tallest in England, having been blown down so early as the year 1698. The inside of the church is fitted up like Portland chapel in London. The seats are all of oak wainscotting, and the altar-piece is a tolerably good copy of the transfiguration by Raphael. The area about the church is formed into a pleasant walk, planted with trees, and commanding a view of the serpentine course of the Ouse. The town-hall is a large brick building, surmounted with a gilt swan, which is the burgh arms. The principal floor is kept for the magistrates when they hold the parish court and sessions. The jail, which is built in the form of a castle, is appropriated chiefly for those who have committed offences in the town and parish. The free school, founded in 1540 by Isabel Denton, has been increased by several donations. All the business of the county was formerly transacted at Aylesbury, but, by a late act of parliament, the summer assizes were brought back to Buckingham in 1758. The inhabitants of Buckingham are principally employed in agriculture and in lace-making. The women, who are engaged in this manufacture, make from eighteen pence to two shillings a day; but the establishment of a lace-manufactory at Nottingham, where it is made by machinery, has considerably injured the retail trade in this place. The principal sort of lace which is made, is fine black and white thread lace. There are a few corn and paper mills upon the Ouse. In the time of Edward III., one of the staples for wool was fixed here; but the trade being removed to Calais, it soon declined; and, in the reign of Henry VIII., Buckingham was one of the decayed towns which was relieved by act of parliament. In the year 1724, no fewer than 138 houses were consumed by a dreadful fire, which occasioned a loss of L.40,000. Number of houses, 581. Population, 2605; of whom 313 were returned as employed in trade and manufactures. See Wil-
BUCKINGHAMSHIRE.

The Chiltern Hills and their appendages, occupy the southern parts of Buckinghamshire, which is elevated, healthy, and pleasant. These eminences are principally composed of chalk, intermixed with flints; and, as the soil is very shallow, with a chalk bottom, the flints are regarded as necessary for keeping the surface moist, and protecting the grain from the too powerful effect of the sun. On this account, the farmers do not attempt to clear the soil of these stones; but in many cases they are rather anxious to increase than diminish their number. The soil in this part of the county is very much inferior to that of the northern district, though it is extremely productive, from the attention which is paid to the cultivation and improvement of the land. The lightness of the soil calls forth the utmost activity on the part of the farmer. Every material that can be employed as manure, is carefully collected, and judiciously applied; and every improvement in agriculture is readily adopted. The extensive and prolific vale of Aylesbury occupies the centre of the county, and furnishes a rich pastureage to vast quantities of cattle. The dairy and grazing systems are chiefly followed in this part of the county, the amazing fertility of which was known in the days of Drayton, who mentions it in the following lines:

"Aylesbury's vale that walloweth in her wealth;
And (by her wholesome air continually in health)"

"Is lusty, firm, and fat, and holds her youthful strength."

The wonderful fertility of the soil about Aylesbury and Buckingham, where the meadows bring forth their produce almost without exertion, has generated among the farmers a remarkable degree of indolence and inactivity. They considered it as a disgrace to suffer a heap of manure to be seen at one end of their field.—to plough in straight lines,—to disturb an ant-hill on his pastures,—or to permit more water than falls from the heavens to pass over their meadows. The fine brooks and rivulets which flow through the meadows, are allowed to pursue their course unused; and, excepting in the neighbourhood of one or two of the paper-mills, there is scarcely an acre of land irrigated through the whole county. The northern parts of Buckinghamshire are diversified with gentle sand hills, which enter it from the county of Bedford.

The soil of this county is composed chiefly of rich loam, strong clay, chalk, and loam upon gravel. Wheat, barley, oats, beans, and safflower, are the principal articles of produce in the Chiltern district. Only a small part of the northern division of the county is arable. The great quantity of butter which is made annually on the pasture and meadow farms, is chiefly sold to the London dealers, who contract for it every half year. Eight pounds (sixteen ounces to a pound) is the average weight of butter produced weekly from each cow in summer; while six pounds is the average weight in winter. A mill churn, wrought by a horse, has been lately introduced into some of the dairies, to facilitate the operation of churning. In other dairies, a barrel churn is used, wrought by two men, who make from six to six score pounds of butter at one churning. The scum and butter-milk are employed for the purpose of fattening swine. Calves are suckled in great quantities in the neighbourhood of Medmenham and Great and Little Hampton; and, at the town of Aylesbury, and in its vicinity, the rearing of ducks for the supply of the London market is an object of great attention. By a restriction of food, and by other artificial means, the ducks are prevented from laying till the months of October and November; and, for some weeks previous to this period, they are fed with stimulating provisions; and when the eggs are ready, a hen is employed to sit, and is frequently obliged to continue in the nest till three successive broods are hatched. Exhausted with this duty, the animal often dies as soon as it is performed. When the young escape from the shell, they are nursed with particular care at the side of a fire; and by such artificial and unnatural means, ducklings are sent at Christmas to London, where they have sometimes been sold from fifteen shillings to a guinea a pair.

In the agricultural operations of Buckinghamshire, the labour of horses is preferred to that of oxen. The heavy quality of some parts of the soil, and the flintiness of other parts, have induced the farmer to decide in favour of the former. The swing and high wheel ploughs, drawn by four horses, two abreast, are principally in use in the southern parts of the county; while the loose-handle swing, and low wheel ploughs, wrought by five or six horses in a line, are generally employed in the northern division. The nature of the leases in Buckinghamshire is a very considerable obstruction to agricultural improvement. The tenants are confined to two or three crops and a fallow, and they are prohibited to grow clover and green food.

The manures chiefly employed in this county, are marl, peat-ash, yard and rabbit dung. Hair and hoofs are strewn with great advantage on the strong and cold soils; and the wheat and young clover are greatly invigorated by the application of soot and ashes.

The rents of farms vary, in general, from L. 60 to L. 250 a-year; a few rents are as high as L. 500, and two or three rent at L. 1000. The commons were estimated at 91,000 acres, but a very considerable proportion of these are now inclosed. The heaths of Iver, Fulmer, Stoke, and Wycombe, along with the other waste lands, do not exceed 600 acres. Great
quantity of fine beech trees are produced in the southern part of the county; and nearly the sixth part of the ground between the Thames and the road to Oxford is covered with that wood. Numerous plantations of Scotch fir are thriving on Wavendon heath, which is now the property of the Duke of Bedford, and which was inclosed in 1778. In the coppices of Whaddon-chase there are many fine oak and ash trees.

The principal manufactures of Buckinghamshire are lace and paper. Almost all the lower classes of females in the county are employed in lace-making; and there is scarcely a house in which there is not a lace-pillow, parchments, bobbins, gimps, pins, thread, and other requisites for that manufacture. It is said, that more lace is manufactured in the town and neighbourhood of Newport Pagnell than in all the rest of England. A market is held every Wednesday for the purpose of selling this article; and great quantities of it are disposed at the fairs, of which no fewer than six are held annually. The manufacture of paper is carried on to so great an extent in the neighbourhood of Wycombe, as in any other part of England. There are no fewer than fifteen corn and paper mills on the part of the small river Wycombe which passes through the parish. At Amersham, there is a cotton manufactory, established about twenty-two years ago, which employs above 100 persons, though a considerable part of the business is performed by machinery. Wooden articles, in the respective branches of round, hollow, and Tunbridge-ware, are manufactured at Chesham.

The antiquities of the county are not very numerous. Stony Stratford, or its immediate vicinity, has been regarded by several antiquaries as the Lactodorum of the Itinerary: Considering that the etymology of Lactodorum, in the British language, perfectly agrees with its present English name. * Camden supposes the particular spot occupied by the Roman station to have been at this town, through Dr Stukely places it at Old Stratford, and Dr Salmon at Calverton. The ancient church of Stewkely is of Saxon workmanship, and is mentioned by Dr Stukeley as the oldest and most entire he ever saw. The date of 1106 is said to have been observed on a stone by some workmen who were repairing the roof of the chancel. The cross, built upon the side of a high, steep, and chalky hill, near the hamlet of Whiteleaf, is supposed by Mr Wise to have been erected in the reign of Edward the Elder, in commemoration of a battle fought against the Danes. It is about 100 feet high, and 50 broad, tapering to 20.

In the neighbourhood of Wycombe, in a meadow on the grounds at Loakes, there was found, in 1724, a tesselated pavement, about nine feet square, with the figure of a wild beast in the centre. The borders are curiously ornamented with small square stones of different colours. The coins discovered along with it were those of Antoninus Pius and Marcus Aurelius. A Roman vessel was found on digging in the High Street of Wycombe; and several Roman coins have been found in the neighbourhood.

* Both of these are derived from the stones and fords across the rivers.

† For a full account of these, see the Description of the House and Garden of Stone, 8vo, 1797; and Br.ley and Britton's Antiquities of England and Wales, vol. i. p. 295.

The chief rivers of Buckinghamshire are the Thames and the Ouse. The Thames rises in the county of Hertford, near the borders of Buckinghamshire; and after flowing, from east to west, through the vale of Aylesbury, it is enlarged by the waters of several tributary streams, and enters the county of Oxford near the town of Thame. The Ouse enters Buckinghamshire on the western side, and, after passing Water Stratford, and Buckingham, it winds to the north through a rich tract of meadow land, and pursues its course to Stony Stratford, Newport Pagnell, and Olney. After turning suddenly to the east, it leaves the county near Brayfield.

The trade of this county has been greatly facilitated by the Grand Junction Canal, which enters it near Woolverton, and, after running eastward within a mile of Newport Pagnell, it flows to the south, and passes Fenny Stratford, Stoke Hammond, Linslade, and Ivinghoe, and enters Hertfordshire near Bulbourne. A cut, called the Navigable Feeder, has been made from the canal at Bulbourne to Wendover, and another from Old Stratford to Buckingham.

The county of Buckingham is about 45 miles long, 18 broad, and 138 in circumference. It contains about 518,400 acres of land, of which 352,000 are stated to be arable, and about 170,000 acres pasture, with about 5000 acres of waste ground fit for cultivation. The number of houses is 20,443, and the population 107,444. The number of males is 52,994, and the number of females 55,450; of whom 25,083 were returned as employed in agriculture, and 20,138 as engaged in trade, manufactures, and handicrafts.

There are 185 parishes in Buckinghamshire, and 15 market towns, viz. Buckingham and Aylesbury, the county towns, Amersham, Beaconsfield, Chesham, Colnebrook, Ivinghoe, Newport Pagnell, Olney, Risborough, Stony Stratford, Wendover, Wycombe, Winslow, and Great Marlow. It is divided into eight hundreds, viz. Ashenden, Aylesbury, Buckingham, Burnham, Cottesloe, Desborough, Newport, and Stoke. It sends fourteen members to parliament: two from the county, two from Buckingham, two from Aylesbury, two from High Wycombe, two from Amersham, two from Wendover, and two from Great Marlow. With the exception of six parishes belonging to the see of Canterbury, and four in the diocese of London, the whole of the county is in the diocese of Lincoln. It is in the Norfolk circuit, and pays twelve parts of the land-tax, and furnishes the militia with 560 men. The poor's rates have been augmented to 22s. in the pound.

The magnificent mansion and grounds of Stowe, the seat of the Marquis of Buckingham, form the principal ornament of the county. When viewed from a distance, they appear like a vast grove, interspersed with columns, obelisks, and towers, which seem to emerge from a luxuriant mass of foliage. The pleasure grounds occupy 400 acres; and the mansion contains a collection of the finest paintings, and a very choice and spacious library. The other prin-
BUCLEKER. See AMOUR.

BUCKET, JOHN BAPTISTE MICHAEL, a celebrated chemist, was born at Paris on the 18th of February 1746. After distinguishing himself in the course of his education at school, he was sent by his father, who was an advocate, to study the profession of the law. His attention, however, had not been long directed to this subject, when it was attracted to the study of the sciences, and his time was henceforth devoted to chemistry, medicine, and anatomy. Having attended the lectures of the most celebrated teachers, and spent a great part of his finances in the acquisition of knowledge, he resolved to become a candidate before the faculty of medicine, for a licence, free of expense, which is always given to the most deserving at the opening of every session. Though Bucquet was not the successful candidate, yet he never lost sight of the object of his ambition, and, by the assistance of his friends, he was soon enabled to defray all the expense of a regular licence, at the end of which the first place was assigned to him by the faculty. The lectures on chemistry and natural history, which he now began to deliver, were numerously attended. By his eloquence as a public speaker, and the interest which he contrived to throw upon every subject which came under his review, he attracted to his lectures all ranks of society, and widely extended his reputation as a philosopher.

In order to assist the students who attended his lectures, he published in 1771, in 2 vols. 12mo, his Introduction à l'étude des corps naturels tirés du regne mineral; and in 1773 appeared his Introduction à l'étude des corps tirés du regne vegetale.

In the year 1775, Bucquet was appointed to give lectures on Pharmacy, and upon the death of M. Roux, in 1776, the Faculty of Medicine unanimously appointed him professor of chemistry, and his first course of lectures was delivered in 1777.

Having now the command of a more extensive laboratory, our author directed his attention to his favourite study; and the results of his chemical researches were read before the Royal Academy of Sciences. His first memoir, entitled, *Experiences physico-chimiques sur l'air qui se degage des corps dans le temo de leur decomposition, &c.* was published in the 7th volume of the *Memoires des Savans Etrangers,* and contains a series of excellent experiments on the proportion and effects of fixed air. By working, however, with two small quantities, he fell into some mistakes respecting the specific gravity and the acidity of that gas. His second memoir, entitled *Memoire sur quelques circonstances qui accompagnent la dissolution du sel ammoniac par la chaux,* &c. was presented to the academy in 1773, and published in the ninth volume of the *Memoires des Savans Etrangers,* p. 563. In the same volume he has likewise published *Memoires sur plusieurs combinations salines de l'arsenic.* The celebrated Duke de la Rochefoucault and M. Bucquet made a number of joint experiments on the analysis of zeolite. They obtained from it a good deal of water, and the residue, formed with vitriolic acid and salt, arranged in small needles, from which they concluded that zeolite is not a volcanic product, and that it contains a particular earth analogous to magnesia. (See the Mem. Sav. Etrang. tom. ix.) The attention of M. Bucquet was next directed to the analysis of blood. His memoir upon this subject, which is said to be a model of precision, was read before the academy on the 11th of May, but has not yet been given to the public. These researches were followed by a series of experiments, made along with M. de la Planchon, on the best method of preparing the different kinds of ether, but particularly the muriatic and the nitrous. The memoir in which these experiments are detailed, has not yet been printed.

The talents of M. Bucquet were now joined to those of the celebrated Lavoisier, for the purpose of verifying the fundamental experiments of the animal kingdom. These distinguished chemists have settled a number of uncertain facts on the progress of heat, and on the nature of acids and gases. They repeated many experiments which required intense heat, and a very complicated apparatus; and the result of their labours was drawn up in 15 articles, which were presented to the Royal Academy of Sciences.

In the memoirs of the Royal Society for 1776, p. 377, M. Bucquet published an analysis of opium, and in the same volume he has given the abridgment of a memoir, which was afterwards published separately in an enlarged form, under the title of *Memoire sur le maniere dont les Animaux sont affectes par differens fluides aeroformes mephitiques et sur les moyens de remedier aux effets de ces fluides; precedee d'une histoire

† "I am told," says Mr. Pennant, "that the great small, or *Pomatia,* is found in the neighbouring woods, which is its most southern residence in this island. It is of exotic origin, and, according to tradition, was introduced by Sir Kenelm Digby, as a medicine for the use of his lady."
Buda.

Bucquet abrégé de ces differens fluides aéiformes ou gaz. 8vo. 1779.

During all these occupations, M. Bucquet found sufficient leisure for the practice of medicine. His reputation as a lecturer, induced many of the most opulent persons in Paris to employ him as a physician, and from constantly associating with that class of society, he acquired too great a predilection for the manners and luxuries of the great.

This mode of life contributed, probably, along with his severe application to study, and his extreme sensibility, both of body and mind, to bring upon him those bodily sufferings which emblittered the last years of his life. A dreadful depression of spirits, and an obstinate watchfulness, deprived him of that rest which was necessary to his exhausted frame; and he was frequently obliged to rise in the middle of the night, and fix his mind upon some particular subject, in order to withdraw it from the impulses of a vigorous imagination, which overwhelmed him with too rapid a succession of objects. In April 1779, he was attacked with the most alarming convulsions, and fainting fits, which greatly reduced his bodily strength; but, in spite of his extreme debility, his ardour for the sciences made him resolve to give his course of chemical lectures at the Faculty of Medicine. The heroism with which he fulfilled this resolution, is perhaps unparalleled in the history of science, and scenes more truly affecting were perhaps never witnessed, than those which occurred during the delivery of his last course of lectures. When the hour of lecture approached, the cries wrung from him by bodily pain gradually subsided; his countenance assumed a serene aspect; he tore himself from his bed, and repaired, with a tottering step, to his amphitheatre. In the course of his lecture his utterance was alternately hastened and interrupted, by the excruciating torments which he suffered, and he was often seen to press himself against the table of his laboratory, to smother the cries of an unsufferable agony, without ever losing sight of the subject of his lectures. His pupils listened to him with affection and admiration, and, with their eyes bathed in tears, they received the last words of a master whom they esteemed and loved. When this course of lectures was completed, a settled melancholy preyed upon the mind of Bucquet: he saw that his talents could no longer be exerted, and that the short period which he had to live must be a period of unexampled suffering. To relieve his bodily agonies, he often took a pint of opium, and more than a hundred grains of opium in a day, but he did not long sustain these violent excitements. He died on the 24th of January 1780. The principal seat of his disorder was in the colon, which was obstructed, shrivelled, and ulcerated. His stomach, and other intestines, were inflamed and softened by the effects of ather. (o)

Buda. See Botany, Part II, p. 46.

BUDA, the Aecinium of the Romans, the capital of the circle of Pest, and metropolis of Hungary, is beautifully situated on an eminence on the west bank of the Danube, about 125 miles south-east of Vienna, and 150 north-west of Belgrade. It is supposed to have received its name from Buda, the brother of Attila; this, however, seems only to be the Turkish

name, as it is called Offen by the inhabitants, and throughout Germany. On the opposite side of the river stands Pest, the Contra-Acinium of the Romans, which is connected with Buda by a bridge of boats across the Danube, above 300 yards in length, and consisting of 63 large pontoons. In statistical descriptions, they are in removal considered as one city, and are spoken of in the same way as we do of London and Westminster. The city of Buda has neither fortifications nor gates. The castle stands at the extremity of the hill towards the east, and commands the greatest part of the city. It is encompassed with a deep moat, and is defended by an old-fashioned tower, and other fortifications. The suburbs, or "Jews town," extends from the city to the Danube. The houses are mostly built of square stones, but the whole town has an ancient and sombre appearance. When Buda was the residence of the sovereign, in conjunction with Pest, it formed the largest and finest city of Hungary. But while it was under the dominion of the Turks, who possessed it above 150 years, its best buildings were suffered to fall into decay. Of the remains of these, the principal is the church of the Ascension of the Virgin Mary; and in their stead arose many mosques and minarets; several of which were, in their turn, destroyed in the last war by the German artillery. There is here a convent of Carmelite nuns, and several churches belonging to the Franciscans. It has also a considerable number of caravanseras and mosques, some of which are very elegant buildings; but the finest edifices of Buda are its warm baths, which vie with the most magnificent in Europe. These warm springs were considered by the Turks as the most valuable luxuries, which they found in Hungary; and several remains of baths, built in the Turkish fashion, are still to be traced. They were generally circular rooms, of considerable dimensions, with cupolas closely perforated, and studded over with small hemispherical glasses. The baths of Buda have been long famous, and in many cases are esteemed specific. The water is impregnated with sulphur, glan-bar, and iron; and the heat is 49 degrees by the thermometer of Réaumur. The chief public and private buildings, however, are in Pest, which, from being principally inhabited by foreign merchants, has more of the modern style in it, and of resemblance to other large towns. It is surrounded with a wall and moat, and contains the royal palace, which is a large and respectable edifice, a military hospital, six convents, and several churches. The university of Pest is the first school of learning in the kingdom. It was founded at Tyrnau in 1655, by Peter Pazmann, the primate of Hungary, who endowed it with 100,000 florins, and put it under the direction of the Jesuits. It was some time ago transferred to Pest, and, by the suppression of the Jesuits, and the confiscation of their property, its funds were increased to nearly half a million of florins. The original institution consisted only of schools for philosophy and theology; a school of law was added in 1697, and one for medicine in 1770, by the Empress Maria Theresa. The university at present is composed of 39 professors, besides assistants, independent of the theological classes; 6 for
BUDA.

Buda. or Carlowitz, in 1699. From that time it has remained under the dominion of the house of Austria. In 1784, the Emperor Joseph restored the seat of government from Pressburg to Buda, and at the same time removed to Vienna the ensigns of royalty, consisting of a crown, a sceptre, a robe, and a pair of stockings, said to have been worn by St Stephen. But the removal of these regalia out of the kingdom, contrary to an express law of the land, occasioned so much discontent and clamour, that they were returned, and are now secured in a vault at Buda.

From the public offices being transferred to Buda, this city acquired a great addition of wealthy inhabitants, by which the citizens were enabled to let their houses, and sell their wines and other produce to greater advantage; and as a mark of gratitude to the Emperor Joseph, whose measures had been so conducive to their interest in this respect, they requested permission to erect to him a statue. But the Emperor saw the mean and selfish spirit by which they were actuated, and made the following memorable reply: “When prejudices shall be eradicated; when true patriotism, and just ideas of the general good of the kingdom, shall be established; when each, in an equal proportion, shall with readiness contribute his share to the wants of the state, its safety and prosperity; when true enlightening knowledge, improved studies, simplicity in the teaching of the clergy, and the union of true ideas of religion with the laws of society; a solid justice; riches through increased population and improved agriculture; acknowledgment of the true interest of the landlord towards his peasants, and of those towards their landlord; when industry, manufactures, and the demand of them, and general unanimity amongst the provinces of the monarchy, shall be introduced, as I wish and hope, then I merit a statue: but not where the city, by my transferring thither the public offices, for a more easy inspection, obtains a greater consumption of its wines, and a higher rent of its houses.”

In the field of Rakosh, at a little distance from the city, on the eastern side of the river, the Hungarians used frequently to hold their diets; and here, also, the states formerly met on horseback and in arms to elect their king. At some of these assemblies, 80,000 have here pitched their tents; and the Hungarians still venerate the spot as the remembrance of their ancient freedom, and as an altar on which their forefathers had often sworn to defend their rights. According to Professor Hassel, Buda, in 1759, contained 21,665 inhabitants; and Pest, in 1792, 26,684; while, in the same year, M. De- man makes the population of Pest 31,000. N. Lat. 47° 29' 44", E. Long. 19° 10'. See M. De- man Tableau Geographique et Politique des Royaumes de Hongrie, &c. vol. i.; Hassel Tableau Statistique de l’Empire d’Autriche; Townson’s Travels in Hungary, p. 76; An Itinerary from London to Constantinople, p. 40, in Philip’s Collection of Voyages, &c. vol. i.; and Tynna Almanach du Commerce, 1811. BUDDHA. See Birman Empire, p. 531, 532; and Ceylon.

BUDISSIN, BAUTZEN, or Budissa, a city of Saxony; and capital of Upper Lusatia, is situated
BUENOS AYRES.

An extensive viceroyalty in South America, stretching from the Rio Desaguadero to the most northern settlements on the Paraguay, upwards of 1600 miles in length; and from the mouth of the Rio de la Plata to Chili, nearly 1000 in breadth. It has Amazonia on the north; Brasil and the Atlantic Ocean on the east; Patagonia on the south; and on the west, the Cordilleras, which separate it from Chili and Peru. Buenos Ayres was erected into a viceroyalty so late as 1778. It forms the most important part of the Spanish dominions in the New World, and is the channel through which the chief treasures of the other provinces pass to the mother country. It is divided into five provinces, viz. BUENOS AYRES or RIO DE LA PLATA, PARAGUAY, TUCUMAN, LOS CHARCAS OF POTOSI, and CUYO; and its minor subdivisions, beginning from the south, are—

Pampas, 

Tuyu, 

Buenos Ayres, 

Cordova, 

Cuyo and Mendoza, 

Charcas,

Asaugaro, 

Carabay, 

This country forms an extensive amphitheatre, shut in laterally by the Cordilleras of Brasil and Peru; towards the north, by a tract of mountainous country, branching from both these ranges; and on the south by a branch of the Cordilleras of Chili, stretching across the continent nearly to the Atlantic, "leaving towards the south-east," says Mr Wilcocke, the principal markets for these articles are in Holland, Italy, and Portugal. Glazed leather, fustians, gloves, paper, gunpowder, and iron, are also manufactured at Buenos Ayres. East Long. 14° 28', North Lat. 40° 2'. (w)

BUDEWS, BUDERGOVITZ, or Budovecium, a fortified town of Bohemia, in the circle of Bechin, situated on the river Malsha, which, after running round the town, discharges itself into the Moldau. The surrounding country is very fertile, and is enriched with several valuable mines of gold and silver. The rich silver mine of Rudolphstadt is in the vicinity of the town. This town enjoys the staple-rights of the salt which is brought from Austria, and which is here exposed to sale before it is carried farther. Pearls and precious stones are found in the river Moldau. The principal public buildings are the arsenal, and the magazines for the engineer and artillery corps. East Long. 14° 28', North Lat. 49° 2'. (w)

BUENOS AYRES.

Extent.

Divisions.

General aspect.

"the immense opening of the Rio de la Plata, as a wide and magnificent portal, proportioned to the grandeur, to the importance, and to the extent of the regions to which it gives access." These mountains are among the most remarkable in the world for height and riches. Those of the Brazilian ridge are the least elevated. They are generally covered with thick woods, interspersed with arid tracts, completely devoid of vegetation; but are rich both in mines of gold and diamonds. On the western boundary of the viceroyalty, the mountains assume an aspect of unrivalled sublimity. Their aspiring summits, which reach far above the clouds, are covered with eternal snows; and their rugged and naked sides afford no sustenance to the vegetable creation. But amidst these frozen and sterile regions, volcanoes of various dimensions diversify the scene, and mingle their fires with the snow. On the Peruvian chain, seven craters equal to Vesuvius and Etna, are constantly in a state of ignition; and sixteen have been enumerated along the Chilian Cordilleras. The mountains of secondary elevation are clothed with stately forests; intersected with deep glens, through which rush innumerable torrents, and, uniting their waters, form the immense rivers which flow towards the east, and swell the Paraguay and Parana. The intervening valleys with which these mountains are interspersed, though placed at a greater elevation above the level of the sea than even the tops of the Pyrenees, yet, from their sheltered situation, enjoy a temperate and favourable climate, and are covered with a luxuriant herbage. On the tops of some of these mountains, lies the only road of communication between the different provinces; and it is said, that, from the rarefaction of the air in these regions, the traveller can scarcely breathe, and is generally affected with nausea. Within these boundaries, the country is extremely level, and, with the exception of a few hills, not exceeding 500 feet above the level of their base, it is one immense ex-
tended plain, covered with lakes and innumerable rivers, many of which, though equal to some of the largest in Europe, flow unregarded and nameless, and are considered as merely tributary streams. Few of these, however, ever reach the ocean. They are either lost in the lakes, or descend into the level plains, where they stop, without taking any decided direction, and are soon absorbed, or insensibly evaporated.

The principal rivers of this viceregalty are the Paraguay, the Parana, the Uruguay, and the Rio de la Plata. The first of these rises about 134° south latitude, in the Sierra del Paraguay, and, bending its course towards the south, passes through the lake Xarayes, and after receiving the waters of the Cuyaba, Pilcomayo, and Vermejo, terminates at its junction with the Parana. It is navigable for goletas as high as the 16th degree; and though its channel is in general narrow, M. Azara found, that opposite Assumption, where its breadth is only 1382 Paris feet, 196,618 cubic toises of water passed every hour. Its periodical flood, which is occasioned by the overflowing of the lake Xarayes, commences about the end of February, and continues gradually to increase until the end of June, when it again diminishes with the same regularity. The Parana has its source in the mountains of Brazil, and descending by a rapid, but long and diversified course, is swelled by numerous tributary streams, among which is the Yguazu, or Curitiiba; receiving the Paraguay at Corrientes, it passes on to the south; and after being joined by the Salado and other rivers from the west, loses itself in the Rio de la Plata. The Uruguay rises in the mountains which stretch along the eastern coast of America, opposite the island of St Catherine’s, about the 26° of south latitude. Flowing to the west through a naked and desert region, it then takes a southerly direction, and traversing by a winding and irregular course the immense forests of Guaraná, where its stream is swelled by innumerable rivulets, it passes through a rich and romantic country, receiving the waters of the Tebicuary, Miriny, and Rio Negro, and near the 34th degree of latitude, unites with the Parana to form the Rio de la Plata. Though this river is not equal either to the Paraguay or the Parana in the length of its course, yet by the immense accumulation of waters which it receives from tributary streams, it surpasses both in the breadth of its channel; and about 690 miles above its confluence with the Parana, a ten-oared boat requires half an hour to cross it. From the rockiness of its channel, and the turbulence of its stream, the Uruguay, is of difficult navigation, except for balzas, a species of craft peculiar to South America. The name of this river is extended, by ancient authors, both to the Paraguay and the Parana; and the indiscriminate appellation is still retained by some modern geographers. The Rio de la Plata, or River of Silver, originally called Rio de Solis, from the name of its first discoverer, received its present appellation from Sebastian Cabot, who, having defeated a body of Indians on the banks of the Paraguay, obtained an immense booty of gold and silver. This name was applied by Cabot to the whole channel of the Paraguay, from its source to its confluence with the ocean, and the Parana and Uruguay were merely considered as tributary streams. But it is now confined to the Gulf extending from the junction of the two last mentioned rivers, to the capes St Maria on the north, and St Antonia on the south, where the water still retains its freshness, and the tide is very imperceptibly felt. Between these points it is nearly 150 miles broad. But this noble expanse of fresh water, which is without a parallel in the world, is deformed with rocks and sand banks, which render its navigation both difficult and dangerous; and is exposed to impetuous torrents of wind, called Pamperos, which sweep with dreadful fury over the vast plains of the Pampas. These storms, however, are generally preceded by thunder, which gives sufficient warning to mariners to prepare for the approaching tempest; and during these gales, Monte Video is the only part where vessels of any considerable burden can lie in safety.

The most considerable lakes are; the Titicaca, which is the most noted in South America, and lies between the two Cordilleras of Peru; in the province of Los Charcas. It is about 240 miles in circumference, of an irregular form, and navigable by vessels of considerable burthen; but subject to violent squalls of wind, which descend from the lofty mountains which surround it. It abounds with fish, and water fowl; and its banks are covered with a fertile soil, and adorned with populous towns and villages. In one of its picturesque islands, Manco Capac, the founder of the Peruvian empire, is said to have first conceived the design of civilizing the naked savages of his country. This island was considered as sacred by the Peruvians, and contained one of their most splendid temples, which was enriched with the annual offerings of the worshippers of the sun. This immense accumulation of wealth was thrown into the lake upon the approach of the Spaniards, who have since made frequent attempts to recover it, but without success. The lake of Iberi, or Caracas, lies between the rivers Parana and Uruguay. Its northern boundary runs in a parallel line with the banks of the former river for nearly 30 leagues, and extends as far to the south; it supplies the river Miriny, which runs into the Uruguay; and from its south-western corner issue three other considerable streams, viz. the Sta Lucia, Corrientes, and Bateles, none of which are fordable. This lake receives neither rivers, brook, nor spring, but is nourished entirely by the simple filtration of the waters of the Parana, a phenomenon of which there is no other example in the world; and this filtration thus supplies not only the four great rivers which issue from the lake, but also the vast quantity of water which must be continually carried off by evaporation, from a surface of more than a thousand square leagues, which, from the experiments of Halley, may be estimated at above 70,000 tons a-day, supposing it the mean temperature of England. This expanse of water, however, is for the most part very shallow, and filled with aquatic plants; so that its interior is altogether inaccessible. The islands with which it is studded, are well stocked with deer and other game; flocks of wild fowl are continually skimming on its surface; its fish are remarkably sweet and

Lake of Iberi formed by filtration from the Parana.
fresh; and many flourishing presidencies are established on its shores.

Among the lakes of this country, there are many which are full of water during the rainy season, and are perfectly dry throughout the rest of the year, and filled with sword-grass, and other aquatic plants. Of this description is the famous lake Xarayes, in the province of Los Chiquitos, which is formed by the overflow of the Paraguay. The channel of this river being unable to contain the rapid accumulation of water produced by the rains which fall during the months of November, December, January, and February. It is spread over a flat and level country, to an immense extent, but so shallow, that though the Xarayes at its height is nearly 110 leagues in length, and 40 in breadth, yet in no part is it navigable. This lake was formerly supposed to be the source of the Paraguay; and many stories were told concerning a beautiful island near its centre, which, from the salubrity of its air, and the spontaneous fertility of its soil, was called the island of Paradise, and which was said to be inhabited by the Orejones, a Peruvian nation who had taken refuge here on the conquest of their country. These, however, and other fables, with which the history of the Orejones are embellished, are merely the ebullitions of Spanish romance, without either foundation or probability. Of the same nature with the Xarayes are the lakes Aguaracaty, and Neembucu, and all those east of the river Paraguay, with an innumerable multitude of others, on the banks of the different rivers, which traverse this extensive vice-royalty.

Salt lakes.

A chain of salt lakes extends from west to east, between the Andes of Chili, and the Rio de la Plata. One of these, in particular, which lies about 120 leagues S. W. of Buenos Ayres, is remarkably salt. It is nearly 18 miles in circumference, and the salt found at the bottom is so hard and thick, that it is difficult to break it with iron tools. Two or three hundred carts are annually loaded with it, and carried to Buenos Ayres; and what is very remarkable in this chain is, that a few of the lakes are fresh, though during the rains they are so swelled, that they often communicate with those that are salt. Besides these lakes, all the springs throughout the greater part of the flat country, west of the Parana and Paraguay, are more or less salt; and few of their waters can be drank till they enter the Parana. The soil of this region, extending about 700 miles in length, and 190 in breadth, is saturated with fossil salt. Great quantities of it are refined for consumption; but it is most abundant between Sta Fé and Cordova, and, in the vicinity of San Jago del Estero, the whole ground is covered with a white incrustation of this substance. Every variety of soil, and every diversity of climate, is to be found in this extensive region; from the barren and uninhabitable steeps of the Andes, whose summits are covered with never melting snows, and the burning deserts of Chaco, to the fertile and delightful vallies which skirt the borders of the Uruguay and Parana. Here all the productions of the temperate and torrid zones find soils and situations adapted to their various natures. We may observe, however, that this variety of climate follows no exact gradation arising from the difference of latitude; but the heat and cold of this country seems to depend rather on the direction of the winds, than the position or declination of the sun. A south, or south-east wind, is always attended with cold, while it is as invariably warm with a climate wind from the north. At Assumption, which lies in nearly the centre latitude of the viceroyalty, M. Azara found, that in ordinary days, during the summer, the mercury in Fahrenheit’s thermometer rose, in his chamber, to 85°; and, on some extraordinary occasions, mounted as high as 100°; while in winter it fell as low as 45°; and, in 1786 and 1789, water froze in the court before his house. The common winds in this country are the east and north. If the south-west blows, the sky becomes calm and serene; and a west wind is here scarcely known; or if it be sometimes felt, it never lasts above a couple of hours. A south-east wind generally precedes the rains in winter; but it is most severe during the spring and summer; sometimes raising such clouds of dust, as completely to conceal the sun. Hurricanes are very rare, but when they do happen are rather violent; as that on the 14th of May 1799, which overturned one-half of the town of Atra in Paraguay, and killed 96 persons. Fogs, snow, and hail, are seldom seen, except on the summits of the mountains. Thunder storms, however, are both frequent and violent. Thunder storms, and, notwithstanding the level nature of the storms, country, and the absence of woods and rising grounds, the bolt falls ten times more frequently here than in the south of Europe. In one of these storms, which happened on the 21st of Jan. 1793, the thunderbolt fell 97 times in the interior of the city of Buenos Ayres, and killed 19 persons. According to M. Azara, the storms of rain and thunder, which are so prevalent in this country, cannot be attributed to the influence of mountains and woods, as there is not a mountain within a hundred leagues of Buenos Ayres, nor a tree south of the river La Plata, or even on the north as far as Paraguay, except on the banks of the rivulets. They must therefore be owing to some peculiarity in the nature of the atmosphere. It must contain a greater quantity of electric fluid than the atmosphere of Europe, and also possess some quality more suited to the condensation of vapour and reducing it to rain. The same author has observed, that the humidity of the atmosphere, and the violence of the winds, gradually increases from the city of Assumption to Buenos Ayres; and that the thunder-storms, on the contrary, are less violent as they proceed to the south. The salubrity of the climate, however, is surpassed by that of no other country in the world. Even in the vicinity of the marshes and inundated lands, which are here to be frequently met with, the health of the inhabitants is not in the smallest degree affected.

We have already mentioned, that this viceroyalty is divided into five provinces; of each of which we shall now proceed to give a very brief and general description, beginning with Buenos Ayres.
This province, whose name implies the salubrity of its climate, enjoys nearly the same temperature throughout the year. The rains, however, are sometimes of long continuance, and thunder storms are not uncommon. The pamperos, too, which we have already mentioned, are very disagreeable, and even at times dangerous from their fury. The soil in the vicinity of the town, and also on the north side of the river, is, in general, rich and productive, requiring very little labour, and no manure, to yield abundance of wheat and maize; also, most kinds of European fruits, as grapes, melons, figs, apples, peaches, and cherries; and even the productions of warmer climates, as pimento, oranges, bananas, &c. Between Buenos Ayres and the river Salado is one complete plain, without a tree or rising ground, till near the banks of the river, which is about 60 miles from the Spanish settlements. On the south of the river, and extending far to the north-west, are the immense plains of Pampas, which present a sea of waving grass for 900 miles, with very few interruptions of wood and eminences. Their luxuriant and nutritive herbage affords Pasture to innumerable herds of cattle, that rove unowned and unvalued, and whose hides and tallow alone are sought after by the Spaniards, and form a principal article of the trade of Buenos Ayres. They are also the abode of immense troops of wild horses and deer, ostriches, armadillos, partridges, wild geese, ducks, and other game; and towards the borders of Chili, guanaes and vicuñas are met with in considerable numbers. Over these plains lies the only route between Buenos Ayres and Chili. The Spaniards generally perform this journey in companies, as the plains are infested by tribes of savage Indians, who go there for the purpose of hunting wild horses, and to rob such travellers as they can surprise and over-power. Through this extensive flat, there are no landmarks or traces by which the road can be discovered for many hundred miles, so that they are obliged to pursue their route by the compass. They generally travel in covered caravans, drawn by oxen, and are accompanied with baggage-horses and mules. These caravans are made almost as commodious as a house. They have doors to shut, and windows on each side; and the floor is covered with a mattrass, on which the passengers sleep for the greatest part of the journey. Travellers, however, are sometimes reduced to great distress, both from the intense heats, which prevail during the middle of the day, and the scarcity of water, which is often not to be met with for several days journey. The road leading from Buenos Ayres to Peru is very different. Post-houses are erected at regular stages, where relays of horses and carriages are provided for travellers; and as no wild and unsubdued Indians lie on that tract, they are under no apprehension of any sudden surprise.

The province of Paraguay, though rich in none of the precious metals, is one of the most opulent in the new vice-royalty, from its vegetable productions. The climate is, in general, temperate and agreeable; the trees are clothed in perennial verdure; and the extensive plains, which are covered with the richest pasture, are enlivened with prodigious herds of horses, mules, cattle, and sheep. The herb of Paraguay, a species of tea, grows here in great abundance, and forms a considerable article of traffic with the other provinces. They carry on also a considerable trade in wax and honey. Numerous missions, established by the Jesuits, are scattered over the province, which are now converted into presidencies, and governed in the same manner as the other Spanish settlements. These presidencies have greatly declined since the fall of the Jesuits; and it was with difficulty that the Franciscan and Dominican fathers, who succeeded the Jesuits, could prevent their total abandonment by the converted Indians. Their united population is now estimated at from 30,000 to 40,000 families.

Tucuman is a rich inland province, producing all kinds of grain and fruits, and abundant pasture, but of a warm and rather humid temperature. It is watered with many beautiful rivers; and there are carriage roads through the greatest part of the province. The woods afford wax and honey, and plenty of game; but are infested with the American tyger, and other beasts of prey. Cotton is cultivated in the neighbourhood of San Jago del Estero, and a small quantity of cochineal is occasionally collected; but indigo, which was formerly here a great commodity, is now, through the neglect of the inhabitants, entirely lost. The Tucuman mules are famous over all the vicerealty for strength and docility; and, according to Estalla, there is no person in this province so poor, that does not kill a cow or a heifer every day for the support of his family.

The province of Los Charcas contains some immense deserts and impenetrable forests; in also of Los Chacras, some extensive and fertile plains, intercepted by the stupendous heights of the Cordilleras. The air is in general mild, and varies very little throughout the year, except on the mountains. In the district of Potosi, it is extremely cold and dry, and the country remarkably barren, producing neither grain, fruits, nor vegetables; while at Tomina, about 120 miles east from the city of Potosi, the air is hot and sultry, and the soil is covered with vineyards and sugar plantations. The delightful vales of Tarija are watered by abundant streams, and are celebrated as surpassing every other part of America, in the salubrity of their climate and the fertility of their soil. Wheat, maize, cocoa, grapes, flax, Paraguay tea, &c. are produced almost spontaneously; and its annual exportation of cattle is computed at 10,000 head, each valued at from eight to ten dollars. The higher regions of this province abound in vicuñas, paces, guanaes, and llamas, which indeed are common to all those tracts, where the elevation renders the air continually cold. Los Charcas is of immense extent towards the north, reaching from the borders of Peru to the confines of Brazil, and comprehending the extensive countries of Chaco, and of the Chiquitos, Moxos, and Chiriguas Indians.

Cuyo borders on the Andes of Chili, and with that country presents the same phenomenon which is observable in the peninsula of India, where the Ghauts, and the Table-land of Mysore, separate the coasts of Coromandel and Malabar. The seasons in
the cities are opposite in their effects to each other; and when tempestuous on one side of the Cordillera, it is serene on the other. In Cuyo the winter is excessively cold, inasmuch that the castle dies in the fields if not housed; while, in summer, the heats are intense, and thunder storms are frequent and violent. The soil, however, is fertile in grain, and most kinds of European fruits. Wine is produced in great abundance, and of excellent quality. It is drunk over all Spanish America; and Mendoza, and San Juan de la Frontera, sometimes export, in one year, 20,000 barrels. Brandy also forms a considerable article of traffic; and vicuña wool is sent in great quantities from this province to Europe.

The following are the principal cities which are scattered over this viceroyalty, with their latitudes, and the year of their foundation:

Notwithstanding the fertility of this country, the benignity of the climate, and the many natural advantages which it enjoys for the purposes of agriculture, the cultivation of the soil has been in a great measure neglected; and this viceroyalty, which, by proper regulations and active industry, might have been rendered the granary of the old world, has hitherto produced little more than what is necessary for the consumption of its inhabitants. The native pride and indolence of the Spaniards, and the brutish sluggishness of the Indians, form the great bar to agricultural improvements in the New World; and extensive plains, fertilized by innumerable rivers, are employed merely in the breeding of cattle. Of late, however, some attempts have been made for the promoting of colonial cultivation, by the introduction of negro labourers and improved implements of agriculture. But many years must pass, and Africa must be drained of many myriads of her sons, before these advantages can be estimated or felt; and we cannot wish success to a system, which can only be upheld by cruelty and oppression. The mineral treasures which this continent contains in its bowels, were the first inducements which led its conquerors to forsake their homes, and brave the dangers and deprivations of foreign warfare. For these, the produce of its surface was neglected and despised; and these still continue to be the magnets which attract the cupidity and ambition of European adventurers.

The mines of this viceroyalty are chiefly confined to the north-western districts, which, in 1778, were separated from Peru; and consist of gold, silver, mercury, copper, lead, and plata. These mines are all in the hands of private individuals, who, upon the discovery of a mine, immediately receive from the king a grant of a piece of ground, containing 80 Spanish yards in length, and 40 in breadth, in the direction of the vein or bed; and are only held to pay a certain duty to government upon the minerals extracted. This duty is valued by Bourgoing on an average for all the Spanish colonies in America, at 11¼ per cent. of the silver, and 3 per cent. of the gold. The proprietors seldom work the metals themselves, as they find more account in letting them out to others, who often enter upon very hazardous, and sometimes ruinous speculations. Though new and rich veins of treasure are almost daily discovered, yet few of them are very profitable to their possessors, being soon abandoned, either from the destruction of the works, by the rushing in of the water, from the vein failing, or from the miner not being able to support the expence.

The following table, which is given by Helms, contains a specification of the various mines that are at present in a state of exploration in the different districts, as registered in the chancery:

</table>
Among these, the silver mine of Potosí is by far the most productive, and indeed the only one particularly deserving of attention. The mountain, from which the metal is extracted, is of a conical form, about six leagues in circumference, and 4182 feet above the neighbouring plains. The discovery of its treasure was owing entirely to accident: a Peruvian, named Diego Hualpa, while chasing some chamois among the rocks, in his ascent laid hold of a small shrub, whose roots giving way disclosed to his view an immense vein of silver, which has been since distinguished by the name of La Rica, or the Rich. The Indian concealed the circumstance from all his friends, and only had recourse to this treasure to supply his occasional wants; but the obvious change in his fortune has excited the suspicions of one of his companions, who, by urgent entreaties, drew from him the secret, but who, upon some slight quarrel, soon after revealed it to his master, a Spaniard. The information was no sooner received than the mine was opened; and it was formally registered on the 21st of April 1545. Since that time, it has been constantly wrought, and the silver, which has paid the royal duties from this mine, has been valued at 5750 millions of livres tournois, equal to £234,603,840 sterling. The mountain is now almost completely excavated, and is perforated with above 300 pits, few of which, however, are more than 70 yards deep. It is now opened at the base, and vaults dug horizontally, penetrate into its bowels, and meet the veins of silver. In these vaults, which are called by the miners **casones**, and are about six feet high and eight feet broad, the air is cold and unwholesome, and there the Indians work alternately night and day, deprived of the light and heat of the sun, and entirely naked to prevent them from embezzling any of the ore.

On the first discovery of the mine of Potosí, the metal was much purer than it is at present, being now greatly reduced, and even inferior to many of the other mines. It is the abundance of the ore alone, which renders it worth working. According to Acosta, the average contents of silver in the crude ore were, in 1574, from 8 to 9 marks per quintal; and the minerals, which yielded 50 marks per quintal, were considered as extremely rich. Since the beginning of the 15th century, however, they reckon only from 3 to 4 marks per caxon, or from \( \frac{3}{4} \) to \( \frac{5}{2} \) per quintal. From this it appears, that the mean riches of the minerals have diminished in the proportion of 170 to 1; but what is surprising, the quantity of silver extracted from the mines of Potosí has only diminished in the proportion of 4 to 1, as will be seen in the following calculations, which are given by Humboldt in a more extended form.

1. From the opening of the mines of Potosí in 1545 to the year 1556, when the royal duties were first recorded with accuracy; Ulloa, upon the authority of Don Sebastiano Sandoval y Guzman, published an account of these mines in 1634, entitled **Pretensiones del Potosí**, makes the total produce which paid duty to be 613 millions of piastres, making an yearly average of 55,726,000 piastres, or 6,556,000 marks of silver. This immense sum, however, M. Humboldt, upon no less unquestionable data, has reduced to 127,500,000 piastres, or 15,000,000 marks of silver, making an annual produce of nearly 1,563,636 marks.

2. The royal duties paid on the silver extracted from the mines of Potosí, between the 1st of January 1556, and the 31st of December 1578, during which the fifth only was paid, amounted to 9,891,906 piastres, making a total produce of 49,069,390 piastres; or 5,765,627 marks of silver, which, for 23 years, makes the average annual produce of 250,688 marks.

3. The duties paid from the 1st of January 1579 to the 19th of July 1736, during which one and a half per cent. de covos was first paid, and then the fifth of the remaining 984 piastres, amounted to 129,417,273 piastres, making a total produce of nearly 610,458,835 piastres, or 71,816,656 marks of silver, which, for 157 years, is at an annual average produce of nearly 435,994 marks.

4. Between the 20th of July 1736, and the 31st of December 1789, during which the one and a half per cent. de covos and the half of the fifth only were paid, the royal duties amounted to 14,542,684 piastres, making a total produce of 128,129,574 piastres, or 15,074,014 marks of silver, which, for 53 years, makes an annual produce of nearly 281,756 marks.

5. From 1789 to 1800, we have no account of the royal duties; but during that period the total produce of Potosí, according to the records of the mint, were 46,000,000 of piastres, or 5,411,764 marks, making an yearly average of 386,554 marks.

From these calculations, it appears that the annual produce of the last period is little more than a fourth of that of the first; but in giving the average produce for periods of such a length, the gradual diminution or increase of the quantity of silver extracted from these mines could not be distinctly marked. We may therefore observe, that during the second period, when the royal duties were first correctly registered, the king's fifth varied from 500,000 to 300,000 piastres; and that during the first 50 years of the third period, the duties varied from 1,000,000 to 1,500,000 of piastres; and then gradually diminished until 1738, when they only amounted to 271,621 piastres, 6 reals. From 1737 to 1759, the increase was equally gradual from 183,704 to 335,468 piastres. We may also remark, that in these calculations, we have uniformly valued the piastre at only 8 reals de plata, while we are assured, that until near the close of the 16th century, the Spaniards reckoned by piastres of 450 maravedis, or nearly 13½ reals.

---

*A caxon contains about fifty hundred weight.

† These duties are extracted from a book of accounts in the royal treasury of Potosí. This book, however, contains no information relative to the years anterior to 1536, although two miners of Porce, Juan de Villaruel and Diego Centeno began to work this vein in 1545.

‡ The covos is an ancient duty, given by the Emperor Charles V. to Don Francisco de los Covos, but which was afterwards assumed by the crown.

Allowance for the value of the piaster before 1600. 15,000,000
To this may be added one fourth of the total produce, on account of the enormous contraband at the beginning of working the mines 32,017,580
Total 160,087,901

From this statement of the wealth drawn from one mine, the reader is not to conclude, that the other mines of Buenos Ayres are in any degree equally productive. Of the immense quantity of silver produced by this viceroyalty; the single mine of Potosí furnishes more than three fourths. None of the rest are so constantly wrought, being either interrupted by inundations or destroyed by neglect. In the district of Carangas, detached pieces of silver unmixed with any ore or stone are found in the sandy deserts extending towards the coast of the South Sea. These pieces are called papas or yams, being taken out of the sand in the same manner as that root is taken out of the ground, and are of various forms and sizes. Two marks or 16 ounces is the general weight; but Ulloa mentions two papas which he saw at Lima, one weighing 60 and the other 150 marks.

The principal gold-mines in this viceroyalty are those of Cochabamba, and Sicasica. The latter belong to Indian natives, and are reckoned very productive, but from the elevation of the mountain are not properly wrought. Pieces of gold of near an ounce weight, are sometimes discovered in the sand, washed down by the rains. In 1730 an Indian found a lump of this metal, which the Marquis de Castel Fuerte bought for 12,000 pieces of eight, and sent it to Spain as a present to his sovereign. Considerable quantities of gold in dust and in grains are found in the sand of the Vermejo in the district of Chayanta; and particles of gold abound in the streams which run in the vicinity of the Indian town of Mazoa, but much of it is lost, as those only are collected which are of the size of a large pin's head. A gold mine is now wrought in the district of Monte Video. Concerning the quantity of this metal, however, which has been furnished by the viceroyalty of Buenos Ayres, from the first discovery of its mines, we have no information. In 1780 there was coined at the mint of Potosí 4,225,000 piastres, viz. 299,246 piastres, or 2204 marks in gold, and 3,938,173 piastres, or 462,600 marks in silver. At the beginning of the 16th century, the annual produce of the mines of this vice-royalty, which paid the regular duties, was 9200 marks of gold, and 414,000 marks of silver; in all 4,219,404 piastres. † And estimating, with Humboldt, the fraudulent exportation of silver at a sixth, or 67,000 marks, we have a total annual produce of 4,850,000 piastres. ‡

In the mountains of Berenguela, are mines of talc, called jasplos blancos de Berenguela, which is beautifully transparent, and is used for windows throughout a great part of Peru. There are also several mines that yield gems, particularly one of emeralds, much prized for their quality by the lapidaries of Europe; but which, owing to some latent reasons, has not been lately resorted to. It is probable that it was from this mine that the Incas derived those extraordinary emeralds which excited the wonder and aversion of the Spaniards, who ignorantly destroyed great numbers of them from the erroneous idea, that if they were real gems, they would stand the stroke of a hammer on an anvil. Many of them have been found in the ancient tombs of the Peruvians, polished and wrought in spherical, cylindrical, and other figures with mathematical accuracy, and with all the delicacy of European workmanship.

Among the mineral productions of this country, Singular we may mention a singular mass of iron, in the province of Tucuman, which is described both by Estalla and Azara. It lies about 70 leagues from San Jago del Estero, nearly 30 leagues by sea, and about 30 leagues from Corrientes. It has a horizontal position; its surface, which is full of rents and irregularities, is open and exposed, and level with the ground; and its dimensions are 12 palms in length, 8 in breadth, and 6 in thickness; and its solid contents 624 cubic palms. § The quality of this mass is equally pure and ductile with that of any other iron, and pieces hewn out with a chisel, show a brilliant colour like fine silver, speckled with red and yellow spots. It is malleable in the forge, and excoriates during the operation, and may be wrought with a file, or drawn into wire like common iron; but it is, at the same time, so hard, that when cutting it, the chisels are often notched and broken. This block of iron has engaged much of the attention of the mineralogists of Europe; and many opinions have been formed concerning its nature and origin. Don Miguel Rubinde-Celis, who examined it by order of the King of Spain in 1783, and who published an account of

---

* According to Azara, more than a third of the silver drawn from the mines of Potosí was never registered.
† The gold is here valued at 145½ piastres, and the silver at 9½ piastres per mark of Castile.
‡ These statements are extracted from Black's translation of "Humboldt Essai Politique sur le Royaume de la Nouvelle Espagne." Some of them appear to be rather incorrect; but we have not the means at present of rectifying any casual error, we have given them exactly as we found them.
§ The palmo is equal to nine inches of Castile.
it in the Philosophical Transactions, supposes it to be of volcanic origin. But M. Azara rejects this supposition as altogether improbable, both from the nature and the situation of the iron; instead of being brittle, it is both flexible and ductile; there is not the least appearance of volcanic matter in the neighbourhood; the nearest volcanoes of the Cordilleras is at 500 leagues distance; and had it been thrown from any of these, it must have sunk deep into the earth, beyond the inspection of man. "I am, however, unable," says Azara, "to explain the origin of this iron; but I am inclined to believe that it is as ancient as the world, and that it came out of the hands of the Creator in the same state in which it now exists."†

After this brief description of the mineral contents of Buenos Ayres, we may now proceed to give some account of the animal and vegetable productions which are peculiar to this region of the world. Among the former we may mention the tapir, or mbo-rebi, which is one of the largest class of animals in South America. It is about 6 feet long, and 3½ high, with a short tail of 2½ inches in length.‡ The legs are short, and the body round and heavy; yet it runs very swiftly; and swims with great rapidity. It has a long neck, surmounted by a coarse mane, which descends over the forehead as far as the eyes; and at the extremity of the muzzle is a projection of about 2½ inches long, which it can dilate and contract at pleasure, and which serves the same purposes as the trunk of the elephant. Its skin is of a firm texture, and of a dark leon colour, except the under part of the head, the throat, and the tips of the ears, which are whitish. This animal delights in the water, and lives chiefly in the marshes, and along the banks of rivers and lakes. It is of a dull and timid nature, never stirring out but at night. It is, however, very easily tamed, and its flesh is eaten by the Indians. But though it lives entirely upon vegetables when in a state of liberty, yet, when domesticated, it devours every thing that comes in its way. Tapirs frequent the banks of the Paraguay and Parana, and generally wander in large companies.

The tamandua, or nurumi, or ant-eater, is a very singular animal, both with respect to its form and dispositions. Its body, which is very thick, is 53½ inches in length, and its tail 28½; independent of a bunch of hair at its extremity. The head is long and woolly, somewhat resembling that of a trumpet, and scarcely thicker than its tail; the ears short and round; the eyes small; the mouth narrow, and without any kind of teeth, but furnished with a long tongue, not exactly round, fleshy, and flexible, and which it sometimes stretches out a foot in length. Its feet are ill formed, and are merely stumps, armed with claws; and of which, however, it makes very little use, unless for defence. It is a most stupid and sluggish animal; never flies from an enemy, but waits for his approach, seated on its haunches, and, grasping him in its arms, destroys him with its claws, which are its only weapons. This animal feeds upon ants, which it gathers with its long tongue; but the smaller species, which climb the trees, and support themselves by the tail, eat honey and bees. This smaller species, which is the tamandua of Buffon, is called caguaré by Azara. It differs from the nurumi both in size and colour. It is also covered with wool instead of hair; and about a third of its tail, towards the extremity, is perfectly bare.

The surugie, or the secundo, according to Azara, is an animal peculiar to America. There are several species of them, but the common characters of all are, a triangular face, very sharp and long; eyes oblique, and jutting out; a wide mouth, and better furnished with teeth than that of any other animal; long whiskers; round ears; which are naked and transparent; a short neck; and long tail, which is thick and vigorous, and almost entirely covered with scales, and which it uses in climbing trees, performing this operation with great facility, and even walls, if the surface be at all rough. The dugs of the female are placed in the form of an ellipse, with one in the centre; and, as soon as she has brought forth her young, she applies each of them to a dug, which it never leaves until it is able to walk and eat alone. The largest of these animals is about 1½ foot long in the body, and 13 inches in the tail. They inhabit the plains in preference to the woods, and hide themselves in bushes or tufts of long grass, or in holes which they dig in the ground. They live upon insects, eggs, small lizards, and mice. They also eat fruit, and are very destructive to poultry; but, when they kill a fowl, they in general merely lick the blood.

The tatuio, or arnadiillo, is very common over all the continent of South America, which is their native and exclusive clime. The body and legs of this animal are very thick, the neck very short, and the claws strong, crooked, and of a great length. Its head is pointed at the snout, the eyes small, and the tongue very long and flexible. A testaceous crust, resembling a coat of mail, extends over the head, back, and tail; and its belly and breast are covered with scaly tubercles, from which spring long bristles. The scales of the forehead, as well as those upon the shoulders and the buttocks, are not susceptible of flexibility, or motion; but those of the body and the

† Mr. Proust, who examined some fragments of this substance, found that nickel was mixed with the iron; but he was unable to conclude whether this alloy was the work of nature or of art. That this mass of iron is a production of nature, can now scarcely be disputed; and though such a phenomenon be very rare, yet there are two other examples, which it would be equally difficult to account for upon any other explanation, viz. the immense mass of malleable iron which Professor Pallas found on the top of a mountain in Siberia, near the river Yenisei, and which weighed 1680 Russian pounds; and the huge block of the same substance discovered at Aken, near Magdeburg, under the pavement of the city, which weighed from 13 to 17 thousand weights, and which possessed all the qualities of the best English steel. Dr. Chal dini, of Wirtemberg, published a work upon this subject, in 1794, in which he examines all the hypotheses which have been invented, in order to explain the formation of these three masses of native iron; and concludes with classing them among those bodies which have lately exercised the ingenuity of the learned, under the name of meteoric stones, &c. See Meteoric Stones.

‡ These dimensions are given in French feet, which are to the English as 3230 to 2047.
tail are disposed in transversal bands, joined to each other by membranes, which allow the animal to stretch or contract itself at pleasure. The tapir lives in burrows under ground, which they dig with great facility, the mole not being more expert; and, indeed, this is their only means of defence, for their motion is so slow, that, when pursued by a man, they must inevitably be taken unless they escape into the earth. This animal feeds upon worms, insects, ants, and carrion, but never drinks. Its flesh is fat and delicate, and equal to that of a sucking pig. M. Azara has enumerated eight species of the armadillo, of which the largest is the great or giant tapir, whose body measures 38 1/4 inches in length, and its tail 18 1/2; and the smallest, or tatee-pichy, is only 10 inches long without the tail, which is 4 1/4.

The cuivy is a remarkable animal, about a foot long, with a thick, nervous tail, nine inches in length, and entirely bare towards the extremity. The muzzle is adorned with whiskers; the mouth and teeth like those of a mouse; the eye very small; and the ear short and without hair, and entirely concealed under bristles. These bristles, which are very sharp and strong, defend the head, body, and part of the tail; and those on the tape of the neck are about two inches long. There are none, however, on the feet or belly, which are covered with brown hair. The female brings forth only one at a time. She has two paps on the pectoral muscles, and one about an inch farther down. The cuivy climbs the largest trees with the greatest facility; and can stand firm upon the point of a vertical pole without supporting itself by the tail, which it only uses when descending. It is, however, a most phlegmatic and indolent animal. M. Azara, who kept one in his chamber for nearly a year, observed that it never showed the least sign of joy, sorrow, or gratitude, but, on the contrary, the greatest stupidity, sluggishness, and indifference. It would remain a whole day, sometimes two, without changing its posture, or even moving; and always rested on its hind paws, with its fore-feet in the air, and its body bent forward. Nothing disturbed it, and it cared not who entered, or who went out. Once a day it ate fruits and vegetables, which it held in its paws, but very little at a time, and never drank. This animal is found chiefly in the forests of Paraguay.

These are the most remarkable among the quadrupeds of this region. They bear no analogy to those of the old world; and, from their nature and habits, seem to be intended to live for ever in the wilds and the desert. Without almost any means of defence, or any resources against the attacks of man, their numbers must be diminished as the inhabitants of the country increase; and it is probable, that a considerable increase of population will be followed with the total extermination of their species.

Besides these, are several varieties of animals common to the ancient continent, but which have been supposed to have degenerated in an American climate. Such a supposition, however, is altogether erroneous; for some of them yield neither in size, in fierceness, nor in strength, to those of any other quarter of the world. The tyger is larger, and is equal in ferocity to any of Africa. Dobrizhoffer mentions the skin of one which measured three ells and two inches in length. They kill and carry off oxen and horses; and one or two of them, says Bouguer, are sufficient to desolate a province. The stags and oxen are also equal to those of Europe; but the puma, or American lion, is much weaker and smaller than those of Africa, and are so cowardly that they will fly from the barking of a dog.

Of the domestic animals, the most useful are the lama and paco, both natives of this country, and inhabiting the Cordilleras, and the higher districts of Tucuman and Los Charcas. There are five species of these animals, distinguished by the names of lama, guanaco, mororomo or chiliqueuq, vicuna, and paco; but they are often confounded by naturalists, and all the accounts which have as yet been received, concerning their different properties and appearances, are involved in considerable obscurity. Some suppose, that the guanaco and vicuna are merely the lama and paca in a state of nature; and that the mororomo or chiliqueuq, is the domestic lama of Chili. This idea, however, is sufficiently confuted by Molina, (in his Natural History of Chili, to which we must refer our readers for a particular description of these animals). He distinguishes the guanaco as having hair, and a bunch on the back, while the lama is flat, and covered with wool. The paco approaches so near to the lama, that it is even difficult to pronounce them a separate species; but the vicuna is very different from both, and is an elegantly formed animal, about the size and shape of a tame goat, except that the neck is longer; the head is round, and destitute of horns, and the muzzle short and beardless. Its wool is extremely fine, of a beautiful fawn colour, and constitutes a most valuable article of commerce. All these animals, in their wild state, inhabit and pasture on the highest parts of the mountains. They seem to delight in the regions of ice and snow, always preferring the north side of the hills, and appear more vigorous in proportion to the coldness of their situation. Those that are domesticated are very serviceable to the inhabitants, both for food, clothing, and as beasts of burden. The lama will carry from 150 to 200 pounds weight, with the greatest safety, over precipices and rugged mountains, where man can scarcely follow it; and a small portion of reedy grass, called ichu, is its only nourishment. Some of them, however, are of such a stubborn nature, that, when they once lie down with their load, they will suffer themselves to be cut to pieces rather than rise before they are sufficiently rested. They all produce bezoar-stones, but the wild animals yield the best, being both larger, and of a better quality and colour, than those produced in a state of slavery, which are small, black, and of little value.

Among the immense variety of birds which inhabit this country, and of which M. Azara has enumerated 448 different species, the Nandu and Condor are the chief. The nandu or American ostrich approximates nearly to the ostrich of Africa, except in the form of its feet, upon which it has three toes, while the other has only one. It is called emu by the Portuguese, and is to be found chiefly in the plains of Monte Video, and the Pampas of Africa.
Buenos Ayres. It is nearly six feet high, and runs with such rapidity, that the fleetest dogs are outstripped in the pursuit. What is most singular in this bird is, that several of the females deposit their eggs in the same nest; and that a single male takes the charge of hatching them, and of leading out, and protecting the young. The condor chiefly inhabits the elevated pinnacles of the Cordilleras. It is commonly referred to the vulture species, though its great strength and vivacity are supposed to give it some claim to rank with that of the eagle. No bird that flies can be put in competition with it, either for size, for rapacity, or for rapidity in flight. It measures across the wings from 12 to 15 feet; and the Indians assert, that it will carry off a deer or a calf in its talons with as much ease as an eagle would a hare or a rabbit. Its beak is so strong as to pierce the body of an ox, and two condors are capable of devouring that animal. All the birds of this region, according to Azara, may, in general, be said to be insecti-ferous, as even the birds of prey feed more upon insects, frogs, toads, vipers, &c. than upon quadrupeds and other birds; and those birds whose form announce them to be graniverous, eat more insects than any other kind of food, which, however, may arise from the scarcity of grain in this uncultivated country.

The profusion of vegetable productions in this province is commensurate with its extent and the diversity of its climate; and it would be impossible, within the bounds of one article, to give any adequate idea of their variety. Its trees are suited for every purpose of naval or domestic architecture, and many of them are extremely valuable for their beauty and duration. Various medicinal gums exude from their stems; and their fruit constitutes a considerable proportion of the food of the natives. Val-erian, meuni, salsparilla, an aromatic and pungent root called *schynaut*, ginger, and many others of spontaneous growth abound in this country; and extensive forests of trees, producing the Jesuits bark, are found in the province of Los Churces. The herb of Paraguay, a species of tea, which is chiefly cultivated in the eastern part of that province, and in the valleys among the mountains of Maracayu, is in great request over all the southern continent of America. The Creoles drink it at every meal, and never travel without a sufficient supply of this favourable beverage. Its use, however, is most universal in the mine countries, as the Spaniards suppose that wine there is prejudicial to the health. Like opium, it gives sleep to the restless, and stimulates the spirits of the torpid; but, when taken to excess, brings on similar disorders to those which are produced by the immoderate use of strong liquors. The profits arising from the cultivation of this plant belonged formerly to the Jesuits, but since their expulsion have fallen into the hands of the crown, and are estimated at the annual amount of 500,000 piastres.

At the first establishment of the colony of Buenos Ayres, the precious metals constituted the principal exports of Spanish America. Allured by the prospects of immediate wealth, the Spaniards disdained to dissipate their industry on objects of inferior importance; and the only productions of the climate, which they raised, were such as, from their rarity and value, were in great demand in the mother country. Commodities no less valuable, and of greater utility, were neglected and despised. The culture even of the vine and the olive; and the establish-ment of several kinds of manufacture, were prohibited under the severest penalties. Their luxuries, their clothes, their furniture, even their instruments of labour, and a considerable quantity of their prov-isions, were imported from Spain; for which they gave in exchange the produce of their mines and plantations. This traffic was carried on exclusively in Spanish bottoms, and confined entirely to the ports of Porto Bello and Vera Cruz, in the Gulf of Mexico. No vessel belonging to the colonies was allowed to trade with Europe; and even the commercial intercourse between each other was either entirely prohibited, or fettered with the most jealous restrictions. In this state of things, Buenos Ayres languished in obscurity. She had become the object of jealousy and distrust to the mother country, on account of her appropriate situation for an extensive trade; and the Spaniards, fearing lest European commodities should be introduced into Peru and the other provinces through this channel, obtained a decree from government, prohibiting every kind of commerce by the river La Plata. This measure excited great discontent in the southern colonies, who were thus deprived of every spur to industry and agriculture; and were reduced to a state of inaction, very ill-suited to their important station, and territorial resources. It was not, however, until often repeated applications had been made to the Spanish government, that the offensive prohibition was withdrawn, in 1602, and they received permission to export in their own vessels, and on their own account, 2,000,000 fanegases of flour, 500 quintals of dried meat, and the same quantity of tallow. But this stinted grant, which was to continue in force only for six years, was loaded with restrictions. The destination of their vessels was confined to Portuguese Brazil and the coast of Guinea; and it was from these countries alone that they were allowed to import such commodities as were merely necessary for their own consumption. At the expiry of this period, these colonies demanded that the permission should extend to every kind of merchandise, and that they should also be allowed a direct communication with Spain. This demand, however, was violently opposed by the consulates of Lima and Seville; and it was consequently restricted to two vessels, not exceeding 100 tons each. But such was their dread of any contraband traffic between this settlement and the other provinces, that a custom-house was established at Cordova-del-Tucuman, which prevented the introduction of all imported commodities into the interior of Peru, under a duty of fifty per cent.; and also the drawing of gold and silver from Peru for Buenos Ayres, even for the payment of the mules which the latter place annually furnished to the former. Notwithstanding, however, the numerous re-strictions and barriers of fiscal regulation, a consi-derable contraband trade was carried on with the Portuguese of St Sacramento; which, though often

Commer-
cial restric-
tions pre-ju-
dicial to the
country.

interrupted, was always renewed, and preserved some degree of activity in the settlement. But it was not until 1778, when a more enlightened policy began to prevail in Spain, under the ministry of Galvez, when Buenos Ayres was erected into a separate vice-royalty, and a free trade was allowed with the mother country and the interior of Peru, that it began to acquire importance and stability, and to assume its appropriate station of a commercial emporium. From this time, the general commerce of La Plata rapidly increased; and, by a royal ordinance of the 10th of April 1799, salted meat and tallow were permitted to pass to Spain and the other colonies, free of duty.

The following Tables, given by Azara, present a statement of the maritime commerce of the Rio de la Plata, taking the mean result of five years from 1792 to 1796. The valuations are according to the tariffs of the custom-houses in these colonies.

Exports to Lima.
From these statements, it appears that the productions of this extensive and fertile country constitute a very considerable proportion of its articles of exportation. They scarcely amount to a third of its imports, the excess being paid in the precious metals. It will also appear, however, that, by the produce of its mines, the balance of trade in favour of this vicereignty, amounts to nearly two millions of piastres.

Though in the foregoing Tables we have given the mean result of five years, yet we may observe, that, during that period, the trade of the vicerealty had considerably increased. According to Mr. Heims, in the last of these years (1796), the exports to Spain, the Havannah, Lima, and Guayaquil, amounted to 5,286,142 piastres; and the imports from the same place to 3,027,660 piastres, besides the traffic to the coast of Africa. In the following years, however, by the involvement of Spain in hostilities with Britain, the trade of this vicereignty had experienced a considerable stagnation. In 1798, many kinds of European goods, particularly linens, had risen to a most exorbitant price. Brandy and Spanish wines were not to be procured; and above three millions of piastres were lying in the warehouses of Buenos Ayres and Monte Video. But from this embarrassment they were much relieved by the contraband trade which they entered into with the Americans, and which was found to be so indispensable to the interests of the colony, that it was either connived at, or openly encouraged; and, indeed, such was the advantage which they derived from this traffic, that their accumulated stock of hides was in a few years reduced to little more than the annual average supply.

According to H. Humboldt, the exports from this settlement in 1803, to Spain alone, amounted to 5,000,000 of piastres in specie, and 2,000,000 in agricultural produce; and the imports from that country were valued at 3,500,000 piastres.

In addition to the maritime commerce of this vicerealty, we may mention the internal traffic which is carried on between its various provinces and the vicerealties of Chili and Peru. Of this traffic, the herb of Paraguay constitutes the most important branch. One hundred thousand arrobas of it pass annually in trade with Peru, and 40,000 into Chili. It is conveyed in covered waggon drawn by oxen from Santa Fé to Juquip and Mendoza, and from thence is carried on the backs of mules to Potosi, La Paz, Peru, and Chili. Four piastres per aroba is the common price of this article in Paraguay; at Potosi, however, it brings from eight to nine piastres, and the price increases in proportion as it proceeds. Immense droves of cattle also pass into Peru; and 60,000 mules of two years old are annually purchased in the vicereignty for that country. In 1789, Buenos Ayres received from Peru, productions, consisting of brandies, wines, grain, sugar, cotton, oil, pimento, baize, and other woollen manufactures, &c., to the amount of 2,034,980 piastres; while her returns in mules, sheep, black-cattle, hides, wool, tallow, wax, soap, cocoa, copper, tin, &c., were valued only at 864,790 piastres, being a balance in favour of Peru of 1,170,190 piastres. This balance, however, arises chiefly from the circumstance, that the provinces bordering on Peru are the principal mine countries, which are more populous and more fertile than the surrounding districts, and consequently require a larger quantity of productions than they can give in return. But the augmented importation of European merchandise into the La Plata in succeeding years, tended greatly to reduce this balance, which may now be estimated at four or five hundred thousand piastres. Besides Paraguay tea, Chili draws from Buenos Ayres the greater part of her European merchandise, wax, tallow, mules, cotton, &c.; and sends in return woollen stuffs, particularly pouchoos ready made, wine, brandy, snuff, sugar, copper, and cordage.

The traffic which the Spaniards carry on with the unsubdued Indians is very considerable, and consists principally in the exchange of European commodities for the different productions of the country. From the tribes that dwell on the confines of the provinces of Paraguay and Buenos Ayres, they derive Paraguay tea, and fine furs. Some gold of a very superior quality, which is supposed to be collected among the mountains, and upland springs on the banks of the Uruguay, has lately been brought to Buenos Ayres by those Indians, who contrive to barter it in a contraband way with the Americans or other foreign merchants. From the Pampas Indians.
Buenos Ayres.

and Puelches they buy horses and cattle, furs, guano skins, and sometimes their children for slaves.

These purchases, however, are generally made in the interior by Spanish adventurers, or converted Indians, who carry thither the articles of barter, and negotiate with the chiefs for the value of their commodities. The good faith and integrity of these tribes has been particularly remarked by travellers, who have visited this country; and we extract, for the information of our readers, the following account of the mode in which mercantile transactions are carried on with the Puelches, from Wilcocke's History of Buenos Ayres. "The adventurer who engages in this traffic, on his arrival in the tribe, repairs to the cacique, and presents himself before him without saying a word: the cacique begins by saying, 'So you are come.' The Spaniard answers, 'Yes, I am come.' Then the cacique says, 'What have you brought me?' The answer is, 'A present of wine,' of clothing, or some other article. The cacique then bids the stranger welcome, and provides him with a lodging near his own residence, where all his wives and children then go to bid him also welcome, expecting each a present, which, however trifling, must be given them. In the mean time the cacique causes a horn to be sounded, to advertise his dispersed subjects of the arrival of a merchant, with whom they may trade; they flock around at that signal, and examine the goods which are brought, and which consist of knives, hatchets, combs, needles, thread, looking-glasses, ribbons, &c. When the barter is agreed on, the Indians take away their goods without paying, and the merchant thus delivers all his goods without knowing any one of his debtors, and without seeing many of them, as those who come to his tent buy not only for themselves, but also for their neighbours. After a reasonable time, the Spaniard wishing to return, the cacique causes his horn to be again sounded, which is a signal for payment to be made. Each then brings in faithfully what has been agreed upon; and the cattle, in which the purchases principally consist, are driven by Indians, sent for the purpose, as far as the frontiers of the Spanish territory."

The inhabitants of this extensive viceroyalty may be divided into four classes. 1. The European Spaniards, or those born in Old Spain, and the Creoles, or Spaniards born in America. 2. The mulattos and mestizos, or people of colour. 3. Negroes, or Africans; and 4. Indians, or the original inhabitants of the country. Of these, the European Spaniards hold the first rank, and generally fill all the offices of trust and profit in the colonies. They also constitute the most industrious and wealthy part of the population; and the principal trade of the country, both with the interior provinces and with Spain, may be said to be in their hands. Many of the Creoles are descended from the conquerors of the new world, and inherit extensive and valuable paternal estates. Possessed of ample fortunes, and applying themselves neither to the pursuits of literature, or the avocations of commerce, they waste their lives in luxurious ease and sensual indulgence. The strictest equality reigns among this class. They acknowledge no invidious distinctions of rank. They have neither titles, en-

tails, nor feudal tenures; and the only difference that exists is purely personal, and arises from the fortune or reputation of the individual. No white would condescend to serve the richest noble of his nation; and the viceroy himself must be contented with the service of negroes, men of colour, and Indians. In manners, however, the citizens differ considerably from the inhabitants of the country. Buenos Ayres, Montevideo, Maldonado, Assumption, Corrientes, and Santa Fé, present the same scenes of indolence, vice, voluptuousness, and dissipation, as prevail in the capital of the mother country, but carried perhaps to a greater excess. To sleep, to walk, to ride, and to smoke segars, is their constant occupation; and the facility, which this country affords to the lowest of its inhabitants, of obtaining a livelihood without any toil, and the many opportunities which it offers of even acquiring a fortune, encourage them in their native listlessness and idleness. Little cordiality, however, exists between the European and American Spaniards. The jealousy of the Spanish court for the security of her American possessions, which induces her to entrust the government of her colonies entirely to Europeans, to the utter exclusion of the Spanish Americans, has given rise to a deep rooted hatred and suspicion between those two classes of her subjects. While the Europeans look down upon the Creoles as beings of a different order, they return it with equal contempt, and also with sentiments of the most decided aversion, which they even extend to the laws and government of the parent state. "Such is this aversion," says Azara, "that it exists often between a father and his children, a husband and wife, if the one be European and the other American." He, however, adds, that it is strongest among advocates and bankrupts, and all those who are noted for their indolence, incapacity, and vice. The few who have visited the mother country, and have beheld the various gradations of rank, the insolence of office, and the oppressions and exactions attendant upon an absolute monarchy, return to America, well pleased with the liberty and equal rights which they enjoy in their own country, and cursing the distinctions and tyranny of Europe. This evil arises chiefly from the native indolence of the Spanish American, and the repugnance to all kinds of labour, which is the strongest feature in his character. In his infancy, he imbibes high ideas of his own importance, and is led to believe that worth and greatness consists in having nothing to do. Every species of labour is consequently despised, and even the children of the simple sailor disdain to follow the profession of their father. Monks, priests, advocates, and merchants, are the employments to which the lowest aspire. Even the latter of these is often rejected as being too laborious; and many of the inhabitants spend their existence in listless apathy, low debauchery, or the practice of superstitious ceremonies; and owe their means of subsistence entirely to the facility of procuring them in this rich and fertile country. Yet these Creoles possess very quick parts, and were they not debased by their education, might be capable of the highest attainments in both science and the arts; but the germs of every good quality and of every virtuous principle are al-

allowed to perish for want of cultivation, or are smothered by dissipation and indulgence. Latin grammar, the peripatetic philosophy, the theology of the Thonists, and a little common law, constitute the studies of their most eminent scholars. The arts and trades are reduced to those which are indispensably necessary, and they are exercised only by some poor Spaniards from Europe, or by people of colour. The Creolian ladies are reckoned much handsomer than the Spanish; the jetty blackness of their hair and eyes contrasting admirably with the brilliant whiteness of their skin. They are all, however, equally indolent in disposition with their husbands, are fond of shows, and greatly resemble in manners and in dress the ladies of Old Spain, but less reserved, and more gaudy in their ornaments. But with all their external magnificence and costliness of dress and furniture, the Spaniards, within doors, in this quarter of the world, are described as filthy in the extreme. "Abelution of any kind is never, or very negligently performed. Fleas, and various kinds of vermin, are abundant plagues in every house; and the ravages of the ants are only equalled by those of the mice and rats. In their cookery, the bountiful provision of nature is spoiled by the perverted taste of man; and both meat and fish are disguised, and their flavour indiscernible by the accumulation of spice, eggs, oil, onions, and garlic, with which they are dished up."

The Spaniards who inhabit the country, may be divided into the agriculturists and the shepherds. Of the former, however, the number is very inconsiderable, the labour of the employment deterring many from embracing it; and it is in general only followed by those who have not the means of becoming merchants, or of acquiring a sufficient quantity of land for pasture. The shepherds, on the contrary, are numerous, and constitute a considerable proportion of the Creolian inhabitants in this viceroyalty. Their numerous domestic herds, which wander over the plains of Paraguay and Buenos Ayres, are computed by Azara at twelve million of cattle, three million of horses, and a considerable number of sheep, divided among a great many estancias, or farms, each possessed by a single proprietor. An ordinary estancia consists of five or six square leagues, and is under the charge of a capataz, or master shepherd, and a servant for every thousand cattle, who is either a young Creole, a negro slave, a man of colour, or a converted Indian who has deserted from some of the colonies. These shepherds, however, never accompany their flocks into the field, as in Europe, but content themselves with merely collecting them once a week, in order to prevent them from wandering beyond the bounds of the estancia. The rest of their time is spent in breaking their horses, but chiefly in the most degraded idleness. Addicted to the grossest vices, and sunk in ignorance and superstition, this race of men seem to have completely forgotten the origin from whence they sprang, and, in point of civilization, are little inferior to the wildest savages of the desert. Their habitations, which are generally situated near the centre of the estancia, are nothing but miserable huts, whose furniture consists chiefly of a cask for holding water, a horn to drink with, a wooden spit, and a small copper vessel in which they infuse the herb of Paraguay. Some, however, have a chair or wooden bench, and a kind of bed; but the greatest number sit upon their heels, or the skulls of their cattle, and sleep upon skins spread on the ground. Their only food is roasted meat, which they eat without salt, but at no stated hours; pulse and vegetables they consider as no better than grass, and fit only for horses. The offals and bones, which they scatter around their huts, engender an infinite number of flies and noxious insects, and collect a multitude of ravenous birds, which debase them with their constant cries. The dress corresponds with their diet; the filthiness and meanness of their habitations. Few of the herdsmen have a shirt. A poncho, or cloak, which consists of a piece of coarse woollen or cotton stuff, manufactured in the province of Tucuman, about three feet long and two broad, with a hole in the centre for the head to pass through, a slit, a pair of drawers, and half boots formed of the skins which they strip from the legs of their cattle, constitute the whole of their clothing. Besides these, however, the master shepherd, or proprietor, has a doublet, a vest, breeches, and shoes. The dress of the women consists merely of a shirt without sleeves, which is bound round the middle with a girdle; and as they have seldom more than one at a time, when it requires washing, they carry it to the nearest brook to perform that operation, and wait until it is dry. In Paraguay, however, the shepherds are both better lodged, and more decent and cleanly in their apparel than those of Buenos Ayres.

This people are most dexterous horsemen. Indeed, they scarcely know what it is to walk, as they never go any distance on foot. From their infancy, riding is their only instruction and amusement; and they become so habituated to the exercise, that they will keep their seat upon the most furious animal. The principal operations of the estancia are performed on horseback. The weekly gathering of the herds is made at full gallop; but, from the extent of some of the pastures, the cattle are nearly in a wild state, and are hunted and killed in the same manner as the wild oxen in the plains of the Pampas. The common method, however, of slaying their cattle, is to drive a certain number into an inclosure, where the shepherds assemble on horseback, armed with spears in the form of a crescent, a knife, and catch-ropes; as many beasts are then turned out as there are men in waiting, when each pursues his prey at full speed. If the bullock be swifter than the horse, the peasant with wonderful dexterity throws his catch-ropes round his neck, or entangles one or two of his legs, by which means he easily secures him; but he generally hampers him with his spear, and then dispatches him with his knife. This employment is continued every day, until all the cattle appointed for the year's slaughter are killed. They fish on horseback; carry the water from the well on horseback; and even attend mass on horseback, remaining at the church door, which is left open on purpose that they may hear the service. "In short," says Azara, "everything they do is done on horseback." These shepherds, who are bred in the desert, and hold no intercourse with society, except with the individuals of their own estancia, are little superior in knowledge

The principal work of the farms performed on horseback.
to the brutes with which they are surrounded. Without education, and under no law or restraint, they give full scope to the indulgence of their desires. Every boundary of modesty is overstepped; and their habits present the most shameless scenes of indecency and debauchery. Accustomed from their infancy to the slaughter of cattle, which is their chief occupation, and even amusement, they become so habituated to blood, that they often kill one another up-on the slightest provocation, and sometimes, indeed, without any particular motive. They are bound by no ties of friendship for one another, nor of gratitude to their masters, however well they may have been treated. They feel themselves free and independent, always ready to follow their own inclinations, and to maintain their own rights. They leave the estancia whenever they please; and when they have once taken the resolution, no entreaties or promises can induce them to remain. They are, however, very hospitable, and when a stranger happens to come among them, they lodge and entertain him with great civility, without even asking who he is, or where he is going. From the great distance of one estancia from another, some of them being from ten to thirty leagues, there are very few churches in these plains, and the shepherds consequently go very seldom to mass; but they have all a violent desire to be buried in holy ground, which the friends of the deceased seldom fail to fulfil. Those who are very far from the church, allow the dead body to putrefy in the fields, after having covered it with branches of trees, or stones, to protect it from ravenous animals; and when there remains nothing but the bones, they carry them to the priest, who gives them sepulture within the precinct of the church. Others cut up the body, and after carefully separating and cleaning all the bones, and throwing away or burying the flesh, they carry them to the priest. But if the distance does not exceed twenty leagues, the deceased is dressed in his best clothes, and placed on horseback, with his feet in the stirrups, and supported with two pieces of wood fastened together in the form of a St. Andrew’s cross, is carried in procession to the place of burial. Though we have represented these shepherds as consisting generally of Creoles, or Spanish Americans, yet we may observe, that there is among them a considerable intermixture of the other classes; and that even some of the proprietors are free blacks, or men of colour.

The second class, or people of colour, consists of mulattos and mestizos, with their various collateral branches, from the dark shade of the African to the bright hue of the European. A mulatto is the issue of a white and a negro; and a mestizo of a white and an Indian; and the descendents ramify into an endless multiplicity of varieties, which the Spaniards pretend accurately to mark and to define, but which it would be folly to enumerate. This mixed race constitute the most robust and useful class of the community. The mechanic arts, the retail trades, and the other active functions of society, which the higher class, from pride or indolence, disdain to exercise, are chiefly carried on by them; and almost all the hired servants are taken from this class. Among them are also found professors and teachers of the liberal arts. The females, however, particularly the mulattos, too frequently devote themselves to meretricious allurements. They dress with great neatness, possess a considerable share of wit and vivacity, and often acquire an ascendency over their paramours, which the Spanish or Creolian women seldom attain.

Negros.

The negroes constitute the third class of inhabitants in this viceroyalty; and though the Spaniards do not themselves engage in the detestable traffic in human flesh to the African coast, yet they are so far partakers in it, that they make no scruple in buying those that are brought by others. The treatment, however, which this unfortunate race experience in the Spanish settlements, is very different from what their brethren receive in our West Indian colonies. "They form," says Wilcocks, "a principal part of the train of luxury, and are cherished and caressed by their superiors, to whose vanity and pleasures they are equally subservient. Their dress and appearance are hardly less splendid than that of their masters, whose manners they imitate, and whose passions they imitate. Elevated by this distinction, they have assumed such a tone of superiority over the Indians, and treat them with such insolence and scorn, that the antipathy between the two races has become im- placable." But this description, we fear, must be confined entirely to those who are employed in domestic service, and that the same attention and humanity will not be shewn to those who are engaged in agricultural labours. By this, however, we do not mean to insinuate, that even these are treated with cruelty or neglect, but merely to regret, that, from the very nature of their situation and employment, they are more exposed to the exactation and tyranny of taskmasters, who are often little solicitous about the feelings and comfort of those who are under their control. Yet we must confess, that slavery is not here such a "bitter draught" as it is in the other American colonies; and that the little indulgencies and comforts which the negro is allowed by his Spanish master, cannot but put to shame our English planters, who, with all their boasted notions of freedom, have reduced this unfortunate portion of their species to the most degraded servitude, and who exact from them their utmost labours, with unmitigated severity. According to Azara, many of the slaves in this settlement never hear the sound of the whip as long as they live; during sickness, they are treated with great kindness and attention, and are never forsaken in their old age. They are even better fed and better clothed than the poorer classes of the white inhabitants; and many of them obtain their freedom after a short period of service. We are sorry, however, to observe, that this humane conduct has not been extended by the Spaniards, to another class of their American subjects, the converted Indians, who cannot be said to be less deserving of their attention and kindness.

Notwithstanding the constant solicitude of the Spanish court for the security and preservation of her Indian subjects, and the many regulations which have been made in their favour, this class still groan under many arbitrary and oppressive exactions. The wrongs and insults which they have been made to endure, have completely estranged their affections from their
conquerors. They shrink from the voice of a Spaniard, and cherish against him the most bitter but secret animosity. On the first conquest of their country, the Indians were parcelled out into departments, or encomiendas, which were divided among their conquerors, under whose authority they continued for a certain number of years. At the expiry of this period, they devolved to the crown; who either employed them in public works, or made them over to other private individuals. The service demanded by their oppressors, consisted in their labouring for two months in the year in whatever way they chose to employ them, and to pay out of their earnings during the other ten months, an annual tribute of five piastres, from which, however, those who were under eighteen or above forty were exempted. In return for this, the encomendero was bound to provide them with necessaries, and to have them instructed in the Christian religion. But this severe bondage, and the cruelties with which it was attended, had so reduced this class of the American population, that the evil called for some immediate remedy. The Spanish court accordingly appointed officers, with power to deprive of their encomiendas such as could be proved to have been oppressive in their exactions, or tyrannical in their treatment of the Indians; and the nature and extent of the services which they might be required to perform, were precisely ascertained. The facilities, however, of evading such distant authority, and of corrupting those who were entrusted with the execution of its commands, rendered the wildest precautions and laws but weak barriers against avarice and oppression. The same evils continued to prevail, and were the occasion of some formidable insurrections, until many of the encomiendas had reverted, and were annexed to the crown. Their condition is now greatly ameliorated, and their services are very different from those originally demanded. The tribute has been reduced to a piastre a head; and it is only in works of primary importance, that they can be compelled to labour: in the culture of maize and other grain of necessary consumption; in erecting buildings of public utility; in forming roads; in tending cattle; and in working the mines; which last task is confined entirely to those Indians who reside within 30 miles of the ore. This labour, however, is most burdensome and deleterious. It annually destroys a large proportion of the inhabitants, either by a rapid mortality, or by engendering the germs of a slow but certain destruction. Those who are liable to employment are called out by divisions, or mesetas, but the number must not exceed the seventh part of the population of the district; and no one can be compelled to go but in his turn. Such as are destined for the mines remain there for six months, and are paid at the rate of four reals per day. In spite of the numerous regulations which have been framed, in order to guard the Indians against the tyranny of their masters, they are still exposed to several arbitrary and burdensome exactions. Unreasonable tasks are often imposed, and the term of their labour is frequently prolonged beyond the legal time. It is only in the more remote districts, where there are but few Spaniards, that they enjoy any degree of relaxation from oppression. In these districts, some of them are even in affluent circumstances, possessing numerous herds, and working mines for their own benefit. From the exuberant fertility of their country, and their knowledge of some of the European arts, they have risen to a state of comparative civilization, and are plentifully supplied, not only with the necessaries, but with many of the luxuries of life.

The general characteristics of the Indians are indolence and apathetic indifference. Their tasks are performed with the greatest reluctance, and require the constant attendance of overseers. Promises cannot induce, nor punishment scarcely compel them to exertion. Their only domestic labour consists in the ploughing of their chacara, or piece of ground; but the sowing and the rest of the culture, and indeed every other kind of work, is left entirely to the women, who spin, make their apparel, grind the barley, and brew the chicha, an inebriating beverage, made from maize, of which all the Indians are particularly fond. Their perseverance, however, is proverbial among the Spaniards; and when any work of trifling importance is to be performed, which requires much time and patience, they say that it is only fit to be done by an Indian. They are devoid of every species of ambition or emulation, and now seem perfectly indifferent to their situation. They are seldom heard to complain, either in pain or sickness. They endure punishment without discovering the smallest symptom of sensibility; and even view death with the most perfect unconcern. This part of their character, however, may with justice be ascribed to the operation of an enervating and degrading bondage. It is only at their drinking entertainments, that they shew any disposition to exert themselves. Every kind of reserve or restraint is then thrown aside, and the night is spent in the most indecent and intemperate mirth. No ties of conjugality, or relationship is regarded, and though, on other occasions, the chastity of their married women is an object of solicitude, yet it is a received maxim among them, that the husband must not resent the privileged familiarities of these orgies.

Of the unsubdued Indians who wander over this vast expanse of territory, and who have as yet resisted the yoke of the Spaniards, it is impossible to give any determinate account. The state of almost perpetual hostility in which they live with the Europeans, has considerably prevented the researches of modern travellers. The discordant relations which have been handed down to us by their conquerors concerning their appearance, their manners, and their internal policy, and which seem to be more the effusions of ignorance and prejudice, than the minute details of historical truth, afford us little opportunity of extracting a correct and simple representation. Independent, however, of the scantiness of our information on this subject, the numerous nations into which these Indians are split, and the diversity of their language and manners, would forbid all attempts at any very particular details in this work. While some of these nations wander through their forests in a state of perfect nudity, unacquainted with every species of cultivation, and living on berries and roots, or depending for subsistence entirely upon fishing and the chase; others practise a rude kind of agriculture, which, from the fertility of the soil, supplies them
with abundance; and display considerable ingenuity both in the fabrication of their dress and their instruments of war. Some have been represented as stupid, cowardly, treacherous, and cruel; while others have been found to possess considerable penetration and judgment, to be sincere, industrious, and brave. Many of the independent nations which inhabit the eastern borders of the Paraguay and Parana, though formerly numerous and formidable, are now reduced to inconsiderable tribes, who, with little power of annoyance, still bear an invincible enmity to the Spaniards. Among these, the most powerful were the Charruas and Minañas, who long withstood, with the most determined resistance, the subjugation of their country. Though now driven from their ancient residence on the banks of the La Plata, and reduced to a few hundred warriors, they still carry on incessant hostilities with the Europeans, either in Brazil or Buenos Ayres. They live in a state of continual watchfulness. At evening the heads of families assemble to appoint the sentinels for the night; and such is their foresight, that this precaution is never forgotten. At this assembly they arrange their plans of attack and defence, and all projects for the public safety and welfare are here communicated and discussed, and, if approved of, immediately put in execution. When a military expedition is resolved upon, they conceal their families in the woods, and send out their spies, well mounted, to discover the situation and strength of the enemy. If they find him weak or unprepared, so that he may be attacked with any prospect of advantage, they dispose their forces in such a manner as to assail him at several points at once; and then, advancing slowly and in silence, precipitate themselves with such sudden fury upon their opponents, that time is scarcely left for resistance. Every male above twelve years of age is massacred, and the women and children are carried off as prisoners, who, however, enjoy among them the most perfect liberty, and soon become so habituated to their manner of life, that they seldom wish to return to their former companions. They are also most dextrous in laying ambuscades, and in making false attacks; but generally content themselves with a single victory, and never follow up their advantages. If repulsed, they easily escape by the superior swiftness of their horses, which they manage with great address. Their warlike accoutrements consist merely in a long spear, pointed with iron, which metal they buy from the Portuguese; and a quiver full of short arrows slung over their shoulders. They go entirely naked, except when they can obtain a poncho, or hat, which they wear in cold weather; and their women cover themselves with a cloak, or cotton shirt, which their fathers or husbands may have taken from the enemy. They are altogether unacquainted with agriculture, and live entirely upon the flesh of the wild oxen, with which their country abounds. They have neither chiefs nor laws. All are equal; and every one retains the booty which he has personally taken in war. But though few in number, they are actuated by such a spirit of unanimity and determined hostility against their oppressors, that their reduction has cost the Spaniards more blood than even the conquest of Mexico and Peru.

The same unconquerable inveteracy against Europeans prevails among the numerous independent nations which rove over the plains of Chaco. They are in general of a robust and lofty stature, are immoderately addicted to chicha, and often terminate their carousings by sanguinary quarrels. War and pillage is their only occupation. They are excellent horsemen, and their principal weapon is a wooden javelin with a barbed point made of deer’s horn, which they use with great strength and dexterity. They take off the scalps from their enemies, and display them at their entertainments, as memorials of their victory. North of Chaco are the Chiquitos, who are by far the most civilized and industrious nation of independent Indians. They sow maize and rice, and plant sugar canes, tobacco, and cotton. The dress both of men and women, consists simply of a kind of cotton shirt, and both wear the hair long, by way of ornament. They are brave, and dextrous in war, and treat their prisoners with great humanity, adopting them into their families, and giving them their daughters in marriage. Drunkenness, however, is their ruling passion, to which they are habituated from their infancy; and from the great heat and humidity of the climate, they are subject to several dangerous diseases, which often appear among them like a pestilence.

The Moxos are a numerous nation, extending towards the north west. They imbue the points of their arrows with the most active vegetable poisons, and sell their prisoners taken in war for slaves. A barbarous practice prevails among them, of interring young children with their dead mother, as no other woman can be found to take charge of them; and when twins are born, one of them is always destroyed. They are more jealous of the honour of their wives, than any of the other American nations; and with them adultery is often punished with death. Among the Moxo tribes, the same custom prevails of poisoning their weapons; and when a male child is born with distorted limbs, or any other remarkable defect, he is instantly deprived of life. They cultivate a kind of root called yuca, of which they make their principal beverage, as they seldom taste water; which, in consequence of the heat, and of the innumerable morasses, is of a noxious quality. They also raise cotton for the manufacture of their garments. Their towns are generally built against the side of a hill, in the form of a half moon, and are fortified with considerable art.

The unsubdued Indians who dwell along the frontiers of Tucuman and Chili, and south of the provinces of Cuyo and Buenos Ayres, go under the general denomination of Moloches and Puelches. These, however, are divided into a variety of independent tribes, concerning which our information is yet very defective. The Pampas are the most powerful, and best known to Europeans. They inhabit the immense plains which stretch between the Rio de la Plata, and the Chilian Cordillera, and long disputed, with admirable constancy and valour, the first establishment of a colony at Buenos Ayres. They compelled the Spaniards to abandon, for a time, their intended settlement; and though this was afterwards accomplished, and many fierce and bloody wars were the consequence of it.
yet they have still maintained their independence. They are now at peace, and carry on a kind of commercial intercourse with the inhabitants of Buenos Ayres. They bring hides and ostrich feathers, which they exchange for brandy, Paraguay tea, sugar, spurs, knives, &c.; and their caciques sometimes pay a visit to the viceroy, who receives them with kindness, and generally dismisses them with a small present. The men seldom wear any covering, except when they come to visit the Spanish settlements; but the women are fond of ornaments. They have necklaces and ear rings, and a great profusion of jewels, which, however, are seldom of any value, and their ponchos are sometimes studded all over with thin circular pieces of copper, of about four inches in diameter.

Much has been said about the religion of the American Indians, but nothing is known with certainty on this point. Their languages have so little affinity to those of Europeans, that it is almost impossible to express, by any letters, their words and sounds; and equally difficult to define, with any degree of exactness, their absurd and incongruous ideas. For information on this subject, however, we may refer our readers to Wilcocke's history of this vice-royalty; and for a more particular account of the manners, customs, &c. of the independent Indians, we refer to Azara, who lived several years among some of these nations, and who was an eye-witness of many of the circumstances which he describes. In his Travels in South America, will also be found much valuable information respecting the natural history and statistics of this country.

We shall now proceed to give a short narrative of the discovery and conquest of the viceroyalty, with a hasty sketch of its modern history.

The accidental discovery of Brasil by the Portuguese Admiral, Cabral, on his way to the East Indies, in 1500, was the first circumstance which led to the exploration of the South American continent. In the following year, Americus Vespucius coasted along its eastern shore as far as the 52d degree of south latitude; but was compelled, by the coldness and tempestuousness of the weather, to return to Portugal, without making any discovery of importance. In 1516, Juan Dias de Solis, grand pilot of Castile, who had been entrusted, by the court of Spain, with an expedition, consisting of three vessels, for continuing the discovery of Brasil, first entered the Rio de la Plata, to which he gave his own name. Fearful, however, of venturing far up the river with his squadron, on account of the difficulty and danger of the navigation, he sailed along its northern coast in his long-boat; and discovering some savages on the beach, who, by their gestures and signs, seemed to invite him on shore, he imprudently landed with a few men, and without taking any precautions for his safety. He and his followers were immediately massacred and devoured by the Indians, within sight of their companions, who remained in the boat, but who were unable to afford them any assistance. The expedition returned to Spain, and this discovery was for some years neglected or forgotten.

The first attempt of the Portuguese to explore the interior of this continent, was equally unfortunate. The reports of the immense riches which the Spaniards had gained in Peru, had reached the ears, and excited the avarice, of the governor of Brasil. He dispatched Alexis de Garcia, a man of courage and ability, to penetrate, by an overland journey, into that country. Garcia, with his son and only three Portuguese companions, constituted the expedition. They reached the Paraguay, and engaging a number of Indians, whom they found upon its banks, to follow them, they passed that river, and entering the empire of Peru, collected some gold and a considerable treasure in silver. Returning to the Paraguay, Garcia, with a view of establishing a settlement in the country, dispatched two of his companions to Brasil with an account of his journey, and some ingots of gold and silver as evidences of his success. Sixty Portuguese, and a party of Brasilians, were immediately sent, under the command of George Sedenno, to form the new colony; but before their arrival, Garcia with his companions had been massacred by the natives, who had made his son a slave, and taken possession of all his treasure. These Indians had suspected his design, but determined to resist the intrusion of strangers into their country. The Portuguese were consequently so harassed upon their march, that they found it impossible to proceed; and after losing their commander and several men, they retreated towards the Parana, in attempting to cross which, most of them were drowned.

These disasters prevented, for a time, any similar attempts at conquest in this quarter, until 1526, when Sebastian Cabot, grand pilot of Castile, who had been dispatched by the Emperor Charles V. upon a voyage of circumnavigation by the Straits of Magellan, anchored in the La Plata, then called Rio de Solis, near the islands of San Gabriel. Having received the most flattering description of the riches and beauty of the country from some Spaniards whom he found in the port of Patos, and who had deserted from the army of Solis, he determined to relinquish the original object of the expedition, and to accomplish farther discoveries upon the Paraguay. After an unsuccessful attempt of one of his captains to explore the river Uruguay, which he took for the true Rio de Solis, he proceeded up the Parana, and built a small fort at the mouth of the Rio Tercero. This fort he garrisoned with sixty soldiers, and called it Santi Espritu, or the Fort of the Holy Ghost. He then followed the course of the river as high as 27° 4 degrees of latitude, where he met with some Indians, who wore in their ears small pieces of gold and silver. These they exchanged with the Spaniards for some European trifles, but could give them no information where these metals were to be found, except that they had received them from some of the tribes upon the Paraguay. Cabot immediately mounted that river, but a party of his men being cut off by the natives, who had divided them on shore, with the promise of shewing them their riches, he returned to Santi Espritu. Satisfied that the pieces of gold and silver which he had obtained from the Indians on the Parana, were the produce of the mines in the neighbourhood, he gave to the river the name of Rio de la Plata, or River of Silver; and dispatched Ferdinand Calderon to Spain, to inform the emperor...
of his discoveries and operations. The emperor was so delighted with the appearance of the pieces of silver, which were the first that had been brought from America to Spain, that he not only approved of Cabot's deviation from his original instructions, and of all that he had hitherto done, but he ordered a great armament to be fitted out for accomplishing the complete conquest of the country. Six years, however, elapsed before this armament was ready for sea; and, during that time, the fort of Santi Espiritu had been destroyed, and the country entirely evacuated by the Spaniards.

Cabot, after waiting two years, and despairing of reinforcements, resolved upon returning to Spain, and appointed Nuno de Lara governor of the fort in his absence, with 110 men. Hitherto a good understanding had been carefully cultivated with the natives, who frequently visited the Spaniards, and supplied them plentifully with provisions; and since the departure of Cabot, Lara had assiduously applied himself to promote and to maintain it. Its continuance, however, was not of long duration, and was interrupted by a circumstance equally unforeseen and unsuspected. Mangora, cacique of the Timbres, in the course of his frequent visits to Lara, had become violently enamoured of Miranda, a Spanish lady, and wife of Hurtado, one of the principal officers of the fort. Accustomed to the unrestrained indulgence of his inclination, the Indian thought only of getting her into his power; and frequently pressed Hurtado to pay him a visit, and bring his wife along with him. The lady, however, had suspected the design of Mangora, and warned her husband of his apprehensions; but as it was the interest of the Spaniards to live in good terms with the cacique, Hurtado declined the invitation in the politest manner. But the Indian was not to be duped by this evasion, and determined, as he could not succeed by cunning, to accomplish his purpose by force. He accordingly chose an opportunity when Hurtado was absent with a detachment of forty soldiers in search of provisions, to surprise the Spanish garrison. Having posted a body of his bravest subjects in ambuscade near the fort, he approached with a few followers under the friendly pretence of bringing refreshments. Mangora was received as usual with every demonstration of cordiality; but he had no sooner gained the gate, than he gave the signal to the ambuscade, when the fort was immediately filled with Indians. A dreadful scene of carnage ensued. Every Spaniard was massacred, but in the midst of the slaughter the treacherous cacique fell by the hand of Lara. Miranda, four other women, and four children, the only survivors, were carried before Siripa, the brother and successor of Mangora, who being also struck with her beauty, conceived the same violent passion for her which had proved so fatal to his brother. His behaviour, however, was tempered with a gentleness and lenity, which could not have been expected from a savage; and though she repelled all his offers with the utmost disdain and acrimony, yet he continued to treat her with great moderation and respect.

On the return of the convoy to the ruins of Cabot's fort, Hurtado, not finding the body of his faithful Miranda, and impelled by conjugal affection, set out alone to seek her among the Indians. Siripa, indignant at his presumption, and conceiving him the only obstacle to his happiness, ordered him to immediate execution; but Hurtado was saved by the intercessions of his wife. The Indian, however, worn out at last by her resistance, and his own jealousy, commanded them both to be destroyed.* Mosques, upon whom the command of the few surviving Spaniards had devolved, was compelled, by the irreconcilable animosity of the Indians, to abandon the fort, and retired to the coast of Brasil.

Such was the situation of affairs in Paraguay when the Spanish armament arrived in 1535, under the command of Don Pedro de Mendoza, who was appointed governor and captain-general of all the countries that might be discovered as far as the South Sea. This armament consisted of fourteen vessels, carrying 72 horses, 2500 Spaniards, and 150 Germans, Flemings or Saxons. The first care of Mendoza was to select a convenient station for a new settlement, and having fixed upon a spot on the south bank of the river, he there founded the city of Buenos Ayres, on the 2d of February 1535. The natives, who at first brought provisions, and seemed well disposed towards the Spaniards, soon showed a determined hostility to the settlers. They cut off their foraging parties, intercepted their provisions, and massacred every European whom they found straggling in the country. They even attacked the city, killed thirty Spaniards, and burnt almost all the houses. This opposition, added to the ravages of famine and disease, which had begun to rage in the colony, determined the governor to look out for a more eligible situation for an establishment, and for that purpose proceeded up the river. Having rebuilt the fort of Santi Espiritu, under the name of Buena-Esperanza, he dispatched his lieutenant Ayolas with three barks well manned to continue the voyage; and required him, if he did not return within four months, to transmit an account of his operations and discoveries. Mendoza soon after became dangerously ill, and naming Ayolas his successor in the government, embarked for Spain, but died on his passage. Ayolas pushed up the river, and treated amicably with all the natives whom he met upon his voyage, until he came to the 25th degree of latitude, where the Indians declined all kind of intercourse with the Spaniards. He immediately landed his forces, and fought the Indians in the valley of Guarnipitam. They were defeated with great slaughter, and an immediate peace was the consequence, when the Indians not only supplied him with provisions, but also brought seven young females for Ayolas, and two for each of his soldiers. Here Ayolas built a small fort, which he called Assumption, from the day on which the battle was fought, being the 15th of August

* This story, which bears evident marks of Spanish romance, is presented to our readers upon the authority of every historian of South America, though we ourselves do not vouch for its authenticity.
1536. Proceeding upon his voyage, he landed at Puerto de Candalaria, in latitude 21° 5', where being assured by the Guarini Indians, that there were several nations to the westward, who possessed a great deal of gold and silver, he resolved to go in quest of them; and leaving his brigantines under the command of Irala, with orders to wait six months for his return, he penetrated by Chaco and the province of Chiquitos as far as Peru; and returned to Candalaria loaded with treasure. Irala, however, had departed before the appointed time; and Ayolas attempting to form a settlement among the Payaguas, was surprised and killed, along with all his followers.

While the progress of discovery was thus interrupted on the Paraguay, the colonies on the La Plata were suffering all the horrors of famine. Galan, the governor of Buenos Ayres, had exposed himself, by his severity and oppression, to the universal detestation of the inhabitants; and his arbitrary and pernicious conduct towards the Indians in the neighbourhood of Buena Esperanza awakened all the ancient animosity of the Timbuz, who drove the Spaniards from that settlement. During these melancholy occurrences, three vessels arrived from Spain with reinforcements under the command of Alphonso Calvella, who also brought out a commission from the emperor appointing Ayolas governor and captain-general of the Rio de la Plata. In case of his death, however, and no successor being chosen by the chiefs of the expedition, he was enjoined by an imperial Cedula to assemble them for the election of a new governor. For this purpose they met at Assumption in the month of August 1538, when the choice fell unanimously upon Irala. At this meeting it was also resolved to abandon Buenos Ayres, and to concentrate all their forces at Assumption, which had already begun to assume the appearance of a city. But of three thousand Europeans who had entered the La Plata, scarcely six hundred remained to compose the population of Assumption. These, however, were soon afterwards reinforced, by the arrival of four hundred Spaniards, under the command of Don Alvarez, who had been sent out by the emperor to take upon him the government of the Rio de la Plata in case of the death of Ayolas. Irala submitted with a good grace, but set himself secretly to foment divisions among the officers of the garrison, and to procure the removal of his rival. The first steps of the new governor were to secure the friendship of the neighbouring Indians; and by his mild and prudent conduct, he not only gained their affections, but converted many of them to the Christian faith; and by firm and decisive measures he repressed the insolence of those more fierce and savage tribes, who were constantly committing hostilities against the Spaniards. Farther discoveries were also prosecuted on the Paraguay. Irala, with ninety Spaniards, had advanced towards the sources of that river, and anchored at the mouth of the lake Xarayes, in latitude 17° 57', which he called Puerto de los Reyes. Proceeding west by land, he fell in with several nations, among whom he found a great deal of wrought gold and silver; but he was unable to discover whence they obtained it.

As soon as Alvarez was made acquainted with this circumstance, he resolved upon undertaking a similar expedition in person, and of opening a way into Peru. Leaving Los Reyes with 300 Spaniards, and provisions for twenty days, he directed his course westward through a woody country, sometimes so impenetrable, that he was obliged to cut a passage for his troops. On the sixth day he reached the banks of a river, whose waters were very warm and transparent. Here several nations sent deputies to him with compliments and provisions, while others attempted to oppose his passage. Proceeding on, he is said to have come to a large town, consisting of 8000 houses or huts, in the centre of which stood a wooden tower, containing a monstrous serpent, which was defied by the Indians. The capture of this town, and the destruction of its divinity, terminated the expedition; for he was compelled to return by the murmurings of his troops, who refused to accompany him farther.

The moderation and upright conduct of Alvarez towards the Indians, and his determined firmness in resisting the avarice and tyranny of his countrymen, had increased the partisans of Irala, who now resolved upon his removal. He was seized on the 26th of April 1534, and afterwards sent prisoner to Spain, accompanied with many grievous accusations, which, however, were never substantiated. But it was not until after eight years delay, that he was fully acquitted, and rewarded with a pension of 2000 gold crowns, and a seat in the council of the Indies, and in the royal audience of Seville.

The humane and temperate proceedings of Alvarez were soon forgotten under the usurpation of Irala. The Indian villages became scenes of pillage and oppression, which produced frequent revolts; and even the Spanish colonists themselves were not free from the rapacity of his soldiery. Tyrannical and suspicious, he was continually surrounded with spies; and imprisonment or death was inflicted upon all, who were suspected of conveying intelligence of his conduct, either to Spain or the viceroy of Peru. His measures, however, though often severe, were executed with firmness and decision, and tended greatly to the extension of the Spanish power in America.

In 1547, the city of Assumption was erected into a bishopric by Pope Paul III.; but it was not until 1554, that the bishop Francis Pedro de la Torre arrived with his retinue in Paraguay. He was accompanied by three vessels full of men, arms, and ammunition, under the command of Martin de Uría, who brought out a commission from the emperor, continuing Irala in his government; and also various orders and regulations respecting the encomiendas and personal services of the Indians. Of these encomiendas we have already given some account at p. 63, when speaking of the converted Indians; and though they were intended by the emperor to guard this class of his American subjects against the caprice and tyranny of the Europeans, yet they were often made the instruments of the most cruel bondage.—The number of Indians, already reduced or converted, were insufficient to supply all the Spaniards who laid claim to their services;—new settlements were consequently resolved upon, and detachments were sent out to discover proper situations for the esta-

Irala is confirmed in his office by the emperor.
Buenos Ayres.

Of this system, however, Trala did not live long to promote the effects; but being seized with a fever, he died at Asuncion in 1557, after nominating his son-in-law, Don Gonzalez de Mendoza, lieutenant-general and commander of the province, until the emperor's pleasure should be known. Mendoza sur-

vised his exaltation scarcely a year; and his death was succeeded by rebellions and civil dissensions throughout the province. The Spanish chiefs, ambitious of wealth, and impatient of control, and far removed from the authority of the parent state, often disputed for pre-eminence. One governor refused to acknowledge the supremacy of another, and frequently retained, or seized by violence or fraud, dignities to which a successor had been appointed.

But, amidst the fierceness of contention, the Indians found no relief from their intolerable bondage. Exposed to the arbitrary exactions and capricious cruelty of their task-masters, they were fast hastening to extinction; and had not some further regulations been adopted by the Spanish court, its possessions in this country would soon have been converted into an uninhabited desert. The preservation and increase of the Indian population, however, was chiefly owing to the labours of the Jesuits, who, by their mildness and humanity, not only reduced them under the dominion of the cross, but established a political government amongst them, of which promises and persuasion were the principal engines of authority.

It was in 1586 that the Jesuits first made their appearance in Paraguay; though, previous to their introduction into this country, they had been many years employed in propagating the gospel in Brasil, which Father Joseph Anchieta, in the phrasology of these times, had filled with the odour of his holiness, and the splendour of his miracles. Their labours, however, were for a time confined merely to the conversion of the natives, without attempting to form any permanent establishments. They visited many of the Indian towns and villages; and following the wandering Guarani through their forests, and into the recesses of their mountains, disposed many thousands of them to receive the gospel. They managed with astonishing address the most fierce andtractable of the Indian nations, with whom both force and fair measures had previously been found unavailing; and their mediation was often successfully exerted in repressing the cruelty of the Spaniards, and in restraining the desolation of those that formed their encomiendas. But their interference, (for they continued to plead with unshaken constancy the cause of the oppressed Indians,) sometimes exposed them to obloquy, and even ill-treatment from the Spaniards, who regarded the natives as their lawful property, which they had acquired by their valour, and which they were determined to maintain against every other authority. The exertions of

these men in the cause of religion and humanity, hitherto desulatory, were now directed to more determinate objects,—the establishment of reductions among the natives. In 1609, Father Torrez, the provincial of the Jesuits, received full power from the governor of Paraguay, which was sanctioned by the bishop, to collect their newly converted Indians into townships, which were to be independent of all the Spanish establishments; to civilize and to instruct them; and to oppose, in the king's name, all who should endeavour to subject them to personal service. They were only to acknowledge the sovereignty of the king of Spain, of whom they were to be considered as the immediate vassals. This power was afterwards confirmed by Philip III, and his successors; and such were the zeal and labours of the Jesuits, that, in the course of 20 years, they had established 21 reductions upon the Parana and the Uruguaian. Their success, however, was suddenly interrupted in 1630, by the devastations of the Paulists, or Mamelukes, (of whom some account has been given in the History of Brasil, vol. iv. p. 492,) who, by their impetuous and reiterated eruptions, almost obliterated the effects of their labours in Paraguay. The Indians, with their native weapons, were unable to resist the fire-arms of their invaders, and the Jesuits were compelled to fly, with their neophytes, from the province of Guayra, and to retire to their missions upon the Uruguaian. In these pressing times, many of the fathers lost their lives, though, in general, the Mamelukes abstained from personal violence to the ministers of religion; and, in two years, 60,000 of the converted Indians are calculated to have been destroyed, or carried off. These disasters the Spaniards beheld with indifference, if not with complacency. They had considered the settlements of the Jesuits as encroachments upon their property; and they even rejected repeated and earnest applications for assistance. They soon, however, felt the effects of their imprudence. The Mamelukes, disappointed by the removal of the missions, advanced with the same hostile spirit towards the encomiendas, devastating their lands, and carrying off the inhabitants; and the cities of Ciudad Real and Villa Rica were razed to the ground. The provincial governments still remained insensible to the situation of the Jesuits, and could be induced, neither by the claims of policy nor humanity, to defend them against their enemies. The only resource, therefore, which remained, was to apply to the Spanish court. A deputation was accordingly dispatched, who pled the cause of their American brethren with such a warmth of colouring and persevering address, that, in 1639, they obtained leave to embody and arm their Indian converts in the European manner. This important privilege soon restored stability and tranquillity to the reductions. The neophytes, trained under the direction of some lay Jesuits, who had formerly been injured to a military life, in their turn became formidable to the Mamelukes, who, in a short time, found it dangerous to appear in the neighbourhood of these settlements. They also rendered very important services to the Spanish governors, who frequently called upon them for assistance on difficult emergencies. On these occasions, however, they were always com-

Reduction of the Jesuits in Paraguay in 1586.
manded by the Jesuits, who took particular care to prevent all communication with the Spanish soldiery or inhabitants, and led them back to the reductions as soon as their services could be dispensed with. Their services, however, were not confined to military operations. They were likewise employed in various public works. They rebuilt the city of Santa Fe; erected the fort of Tabati; and, in 1668 and the following years, five hundred of them worked on the fortifications, the fort, and the cathedral of Buenos Ayres. But while engaged in these operations, their wages, their subsistence, and even the expence of their journeys, were all defrayed by the Jesuits.

The reductions, already planted, were chiefly composed of the Guaranis and Tapases, though many of the tribes between the Parana and Brazil had added to their population. Their country was temperate and fertile; and, under the care and direction of their pastors, productions of necessity and of luxury were raised in abundance. Grain, sugar, cotton, tobacco, wax, honey, Paraguay tea, &c. were sources of comfort to the inhabitants; and advantageous articles of traffic to the Jesuits, under whose government they lived in the greatest harmony and regularity. "Here," according to the eulogium of their advocates, "no person was idle, nor any one overburdened with labour;—all were conveniently lodged and comfortably clothed, and their food was wholesome, abundant, and equally distributed; the aged and infirm, the widows and orphans, were maintained by the community; no monastic institutions, no sordid views of interest, or absurd restraints of pride, fettered the freedom of choice, or defiled the sanctity of marriage; no factitious wants, or destructive luxuries, corrupted the human frame; the benefits of trade were experienced, without the fatal contagion of its vices; neither the practice nor the necessity of capital punishments existed; neither tythes nor taxes were known: and the devouring plague of forensic subtlety, oppression, and delay, was proscribed."

The Spaniards had extended their power over the vast plains which lie between the Paraguay and the Chilian Cordillera. Los Charcas, after an obstinate and vigorous resistance, had submitted to Gonzalez Pizarro, soon after the subjugation of Peru; and Tucuman had also been subdued, and settled by the conquerors of that country. The re-establishment of Buenos Ayres had been resolved upon by the governor of Paraguay, and carried into execution in 1580,—the want of a proper harbour at the mouth of the La Plata rendering that undertaking absolutely necessary. This city was at first exceedingly annoyed by the adjacent Indians, and remained long in a state of poverty. It, however, emerged by degrees into distinction, and rose to be the capital of the viceroyalty. A new province, distinct from that of Paraguay, had also been established about 1620, under the name of Rio de la Plata, now Buenos Ayres, of which Don Diego Gongora was appointed governor.

Except an insurrection of the Indians, held in the encomiendas of Assumption, which was soon quelled by the assistance of the neophytes, in 1660, nothing of importance occurred until 1679, when the Portu-guese attempted a settlement on the north bank of the Rio de la Plata. Their intention was no sooner known, than Garro, the governor of Buenos Ayres, dispatched a summons to Lobo, the Portuguese commander, to evacuate the territory of Spain. Lobo the Spanish, replied, that he was upon the territory of his sove-reign; and even claimed the whole of the left bank of the Paraguay and La Plata, as belonging to the king of Portugal. During some discussions that followed respecting the limits of the two nations, the settlement, under the name of Colonza, or San Sacramento, had been prosecuted with great industry; a regular fortress had arisen, well mounted with cannon, and provided with military stores, and every thing requisite for the building and defence of a city. But Garro having received orders from the viceroy of Peru to attack the Portuguese, its reduction immediately followed, when the fort was levelled with the ground. This settlement has given occasion to many disputes and struggles between the rival powers of Portugal and Spain, and has been successively wrested from its founders and restored, until 1778, when it was finally ceded to the Spaniards.

The spirit of dissension still prevailed at Assump-tion, and a scene of outrage and rebellion arose about the beginning of the last century, which threatened the dependence of Paraguay upon the crown of Spain. There were many chiefs in the province, who, like Irara, were eager for dominion, and only waited for a favourable opportunity to usurp the sovereign authority. Among these was Don Joseph de Antequera, a knight of Alcantara, and a man of family and genius. Intriguing and ambitious, he had fomented discontent among the inhabitants against the existing governor, Don Diego de los Reyes, which rose so high, that Don Diego, fearing an attempt upon his life, fled to Buenos Ayres. Antequera, supported by his friends, assumed the reins of government, and entered upon the exercise of his new dignity without opposition. As soon as this transaction was known at Lima, the viceroy of Peru issued a new commission, dated 16th of February 1722, reinstating Don Diego in his office; and ordered Antequera immediately to quit the province. Antequera, however, had gone too far to recede with safety; and though the order was repeated, he still retained his situation, and even openly avowed his resolution of maintaining himself in the government, in spite of all the dispatches he might receive from Lima. Negotiation was attempted to bring him to his duty, but in vain. He had even sent an armed force to Corrientes, a town within the jurisdiction of the governor of Rio de la Plata, to seize the person of Don Diego, who was carried to Assumption, and thrown into a dungeon. Forcible measures were now resorted to; and Don Balthazar, the king's lieutenant at Buenos Ayres, advanced at the head of the provincial troops, and 2000 of the reduction Indians, to compel the rebels to submission. Antequera, with 3000 men, marched from Assumption to meet him, leaving orders with Juan de Mena, one of his trusty adherents, that, in case of a defeat, Don Diego should be publicly strangled. In the engagement which fol-lowed, the royal troops were routed with great slaughter. Antequera entered the city in triumph.
dragged the royal standards taken in battle before him on the ground, and displayed his own in the cathedral of Assumption. But more timid and temporizing than became his situation, or was consistent with his past conduct, he, instead of throwing off all subjection to the Spanish government, and assuming at once the sovereign power, still nominally owned the sovereignty of the King of Spain, at the same time that he disobeyed his mandates, and resisted his authority. His procrastination, however, was but of short duration, though his fall was more owing to the defection of his friends, than to the power of his enemies. The Bishop of Paraguay had set himself secretly to counteract the influence which Antequera had acquired over the minds of the inhabitants; and by his conciliating manners and intriguing address, in a short time greatly diminished the number of his adherents. So effectual were his exertions, that when Zabala, the governor of Buenos Ayres, was advancing against Assumption with a powerful army, he even ventured to publish a mandate, excommunicating all those who should oppose his reception into the city. Antequera was so confounded by this proceeding, and still more discouraged by the lukewarmness of many of his friends, that he immediately fled with a few of his adherents, and took refuge in a convent at Cordova; but, being afterwards seized at La Plata, the capital of Los Charcas, he and Juan de Mena were thrown into prison at Lima. Zabala entered the city on the 24th of April 1725, and, having quickly re-established tranquillity, left Don Martin de Borua in quiet possession of the government. Borua, however, had scarcely commenced his administration, when he was suspected of favouring the views of Antequera, who, even in prison, looked forward to his re-establishment in Paraguay. The viceroy consequently determined upon his removal, and nominated Don Ignatius Soroeta to succeed him. But a popular faction, under the name of the commune, refused to admit the new governor into the city. At the head of this faction was one Mompo, a partizan of Antequera, and who had escaped out of prison at Lima, and had obtained a municipal situation at Assumption. Eloquent and enterprising, he endeavoured, by every means, to detach the hearts of the inhabitants from the parent state. He openly promulgated the most democratic doctrines, and asserted, that the authority of the people was paramount to that of the king. "Let us oppose," said he, "the reception of Soroeta in the name of the commune, and then no one in particular can be called to account for it." But the abdication of Borua leaving the government without a head, the commune found it necessary to elect a junto, in whom the sole authority of the province should be immediately vested. Of this council Barreiro, the first alcalde of the city, was appointed president. He had hitherto appeared to favour the views of the commune, but it would seem, from his subsequent conduct, that it was with a design of counteracting rather than of aiding their plans; for he began his administration by attempting to restore order and subordination to the province; and, seizing Mompo, sent him a prisoner to Buenos Ayres. The other members of the junto immediately took the alarm, and opposed the measures of Barreiro so effectually, that he was compelled to fly from the city, when Michael de Garai was appointed in his stead.

During these proceedings, Antequera and Juan de Mena, after five years confinement, had been tried at Lima, and found guilty of high treason. They were condemned to be beheaded; but such was the general interest excited in favour of Antequera, that the viceroy, in order to prevent his rescue by the populace, ordered him to be shot on his way to the scaffold, on the 5th of July 1731. The news of his death produced a most violent sensation at Assumption. The city was filled with uproar and confusion. He was canonized as a martyr of liberty, and a victim of oppression; and nothing was heard but encomiums upon his conduct, and lamentations for his fate. For four years the commune continued their disensions, and resisted the Spanish authority; and it was not until the beginning of the year 1735, that order and tranquillity was restored to the distracted inhabitants of Assumption, by the wisdom and active exertions of Zabala, the governor of Buenos Ayres, who is said to have corrected the abuses, and restrained the enormities which had crept into existence since the first revolt of Antequera, with a sedateness and dispatch which caused general astonishment.

The increasing prosperity of the Jesuits now began to attract the attention of the Spanish government. Besides their settlements upon the Parana and the Uruguay, they had established reductions among the Chiquitos and the Moxos; and also several of the Pampas Indians had been united in a reduction called Conception, a little south-east of Buenos Ayres. The number and strength of these establishments rendered them objects of considerable apprehension to the Spanish colonists, who, imagining that they beheld them advancing with a decided step to independence, were alarmed at the stability and importance which they had acquired. They were also exasperated at the subduction of so many tribes of Indians, who, they asserted, belonged to them by right of conquest, and ought to have been divided in encomiendas. Repeated attempts were consequently made to ruin the Jesuits at the court of Madrid. They were loaded with accusations and aspersions, and were solemnly charged with alienating the Indians from the crown of Spain. But many of these imputations having been found to be either groundless or exaggerated, they were confirmed by a royal decree, in 1743, in all their rights and immunities. The revolt of the Guarinis, however, which soon followed, greatly diminished the power of the Jesuits. By a treaty, entered into at Madrid in 1750, seven of the Guarinis Reductions, situated on the eastern side of the Uruguay, were ceded to Portugal in exchange for the colony of San Sacramento, and a right to the whole of the northern shore of the Rio de la Plata. The Guarinis, who had always borne an invincible hatred to their Brazilian neighbours, were exasperated at this proceeding. They maintained, that, as their submission to Spain was merely voluntary, they could not be disposed of to any other power without their own consent, and immediately flew to arms in defence of their rights.
For several years they resisted the united colonial troops of Portugal and Spain; and, rather than submit, determined to abandon their country. They carried off all that they were able; set fire to the remainder, and left nothing but a desert to their enemies. The Jesuits were suspected of having promoted and aided the opposition of the Guaranis; and, though they openly disavowed the charge, they were unable to free themselves from the imputation. They did not, however, long survive this dismemberment of their dominions. The expulsion of their order from Spain in 1767, was immediately followed by the submission of their empire in America. Their missions were converted into regular Spanish settlements, called Presidencies; and they were succeeded in their spiritual labours by the monks of St Francis, St Dominic, and the order of Mercy. We may form some estimate of the prosperity of these reductions, from the number of cattle which they possessed at the time of their annexation to the government of Paraguay, viz. 769,453 horned cattle, 94,983 horses, and 291,537 sheep.

The difficulties attending the direction of such an extensive viceroyalty as that of Peru, determined the Spanish court to disjoin the provinces of Buenos Ayres, Paraguay, Tucuman, Los Charcas, and Cuyo, from that government, and to erect them into a separate viceroyalty, with Buenos Ayres for its capital. This arrangement was soon found to be most conducive to the prosperity of the country, as well as to the advantage of the parent state; for, except some partial insurrections among the Indians of Los Charcas, and the Guaranis presidencies, nothing of importance occurred to disturb the tranquillity of the colonists until 1806, when a British squadron appeared in the mouth of the Rio de la Plata.

This expedition, under the command of Major-General Beresford and Sir Home Popham, anchored off Point de Quilmes, about twelve miles from Buenos Ayres, on the 25th of June 1806. The disembarkation of the troops was effected in the course of the afternoon and night, without the least opposition from the enemy, who, though stationed at the village of Reduction, only about two miles from the beach, remained quiet spectators of our operations. After a feeble resistance on the following day, they fled with precipitation, leaving behind them four field pieces, and one tumbril; and, taking up a new position on the Rio Chuelo, nearly three miles from the city, attempted to oppose the passage of the British troops. A few discharges of artillery, however, and the determined appearance of our army, soon compelled them to disperse, when General Beresford entered the capital without opposition. The conquest of this important settlement was thus effected with a very trifling loss,* and the captors were rewarded with a rich booty in specie and colonial produce. † Short lived, however, was our triumph; for no sooner did the Spaniards discover the inconsiderable force which had possession of their capital, than they immediately determined upon its recovery, and, before reinforcements should arrive from England, to expel from their country these daring intruders. A thousand regular troops from Monte Video, under the command of Colonel Liniers, supported by an armed mob, amounting to nearly 20,000 men, marched against the city. But the British troops, consisting of only 1500 men, received them with such cool and determined resistance, that they were at first repulsed and thrown into confusion. By repeated attacks, however, they prevailed. The British were at last overpowered, and obliged to surrender, on the 12th of August, with the loss of 114 men killed and wounded. Scarcely was the capture accomplished, when succours arrived from the Cape of Good Hope; with which Sir Home Popham, after having made an abortive attempt upon Monte Video, took possession of Maldonado, a strong position at the mouth of the La Plata.

The people of England were so delighted with the intelligence of their new conquest, and so buoyed up with the prospect of a free and ready market for their manufactures, that the ministry, in compliance with the public feeling, but contrary to their own better judgment, resolved to retain a possession which had been acquired without either their consent or approbation. Sir Samuel Auchmuty was consequently dispatched with a strong reinforcement; but, before his arrival, Buenos Ayres had been lost. He, however, took Monte Video by storm, and then sent a small detachment under Colonel Pack to occupy Colonia del Sacramento, which lies on the north side of the river, opposite to Buenos Ayres.

The English general waited now only for farther succours to proceed against the Spanish capital. The Spaniards, in the mean time, however, had made every preparation for defence. Their ancient animosity against the English, which had been excited by the ravages of Drake, of Cavendish, and of the Buccaneers, was now revived; and they determined upon a stout and resolute opposition. Every avenue to the city was barricaded with bullocks' hides, placed from fifteen to twenty feet thick, against which it would be in vain to fire. Many of the houses which had parapet walls were plaited with small artillery, and every citizen that could carry arms had his appointed station. Conspiracies were also forming in the very heart of the British troops. The Spanish inhabitants of Monte Video had secreted arms and ammunition in their houses, with the intention of rising upon their conquerors; and a Spanish gentleman and his servant were executed, for endeavouring

---

* One seaman killed; one officer, one sergeant, and seven rank and file wounded; and one officer missing.

† According to the terms granted to the inhabitants of Buenos Ayres by the British commanders, all bona fide private property was to remain free and unmolested; but all public property, of every description, was to be delivered up to the captors.

Among the former were 138 coasting vessels, with their cargoes, valued at one million and a half of dollars, which were given up to their owners. The specie amounted to 1,491,323 dollars; of which 1,086,308 dollars was shipped on board the Narcissa for England; and the remainder was allowed to remain in the treasury for the exigencies of the army and navy and for the purpose of keeping down the exchange on bills drawn on the respective services.

The merchandise found in the king's stores, consisting principally of jesuits' bark and quicksilver, and in the stores of the Philippine Company, was valued at between three and four millions of dollars.
Buenos Ayres.

General Whitelocke arrived at Monte Video on the 10th of May 1807, to take the chief command of the British force; and, on the 15th of June, was joined by General Craufurd, with the expedition which had been destined against Chili, but which the British government, upon receiving intelligence of the recapture of Buenos Ayres, had commanded to repair to the Rio de la Plata. With this united force of 8000 men, consisting of some of the finest troops in the British service, General Whitelocke sailed from Monte Video on the 21st of June, and, having landed on the 28th in the bay of Barragan, proceeded against Buenos Ayres. After a tedious march of above thirty miles, through a country intersected by swamps and deep muddy rivulets, during which the army were exposed to incredible hardships and privations, being obliged to leave their artillery and provisions behind, and to fight with several detachments of the enemy, which endeavoured to oppose their advance, they reached the environs of the city. Here the English commander having formed his troops into a line, extending along the suburbs, from the convent of Recoleta on the left, to nearly the Residencia on the right, issued his orders concerning the plan of attack, which he proposed should be pursued on the following day. Two six-pounders, covered by the carabiners under Lieutenant-Colonel Kingston, and three troops of dragoons, were ordered along the central street; Sir Samuel Achmuty was directed to penetrate with his brigade the streets on the left, and with the 38th regiment to take possession of the Plaza de Toros and the adjacent strong grounds; and General Craufurd was to proceed down the streets on the right, and with the 42nd regiment to take possession of the Residencia. Each column, preceded by two corporals armed with crows, for the purpose of breaking open the doors of the houses, was ordered to advance until it reached the last square of houses next the river La Plata, of which it was to possess itself, and, forming on the flat roofs, there to wait for farther orders. No firing was to be permitted, until the troops had reached their points of destination, and formed; and a cannonade in the centre was to be the signal for the whole to come forward.

According to this arrangement, the army moved forwards on the morning of the 5th of July; but this extraordinary mode of attack was met, on the part of the Spaniards, by a most vigorous and efficacious resistance. Some of the streets were intersected by deep ditches, planted with cannon, which poured showers of grape on the advancing columns; and a heavy and continued fire of musketry from the roofs and windows of the houses, assailed the British troops at every step of their progress. The left division, under General Achmuty, by the most spirited and successful gallantry, had gained the Plaza de Toros, and taken 32 pieces of cannon, 600 prisoners, and an immense quantity of ammunition, with the loss, however, of the whole of the 88th regiment, which had been overpowered and taken prisoners. The centre division had scarcely entered the street, when they were arrested by a destructive and superior fire, and took up a position in front of the enemy, a little in advance of what it held in the morning. A small part only of the right division reached the Residencia; the rest, under General Craufurd, having taken refuge in the convent of the Dominicans, after a vigorous and protracted resistance, were at last compelled to surrender at four in the afternoon. What human intrepidity could accomplish, was performed by the British troops in this unequal conflict; but what was most galling to brave men in the midst of danger, they were doomed to suffer, without the possibility of retaliating upon their enemies. Their bayonets could not reach their distant and often unseen opponents, whose destructive fire issued from the windows and roofs of the houses, the doors of which were so strongly barricaded, that it was almost impossible to force them. "The nature of the fire," says the commander of the expedition, in his public dispatches, "to which the troops were exposed, was violent in the extreme; grape-shot at the corners of all the streets; musketry, hand-grenades, bricks and stones from the tops of all the houses; every householder with his negroes defended his dwelling, each of which was in itself a fortress; and it is not perhaps too much to say, that the whole male population of Buenos Ayres was employed in its defence." The disasters of this day, which amounted to the loss of nearly a third of the British army in killed, wounded, and prisoners, without having gained any material advantage—and the consideration that these prisoners were in the hands of an exasperated populace, whose animosity to their invaders no power could restrain, if offensive measures were persisted in—induced the English commander to agree to an armistice proposed by General Liniers, on the morning of the 6th. This armistice issued in a convention, by which it was engaged, that the British should evacuate the La Plata in two months; and that all the prisoners on both sides, captured in South America since the commencement of the war, should be restored. The Spaniards were now, for a time, freed from foreign hostility, for which they considered themselves as indebted to the incapacity and presumptuous temerity of the English leader; and those bright prospects of wealth which the British merchants had been led to indulge, from the expectation of a ready market for their manufactures, and which had induced them to enter into the most hazardous speculations, to the amount, it is said, of three millions sterling, were dissipated for ever. So great, indeed, was the antipathy of the Spaniards to the British, that though greatly in want of our merchandise, and knowing that this visit to South America would perhaps be our last, yet they could not be prevailed upon to purchase a single article.

Upon the breaking out of the Spanish revolution, the resentment of the inhabitants of Buenos Ayres was diverted from the English, and fixed upon the ruler of France. The plan of Bonaparte had no sooner been accomplished against the royal family of Spain, than French agents were dispersed throughout the Spanish American colonies, to obtain from the different governments a recognition of Joseph Bona-
parts as their rightful sovereign. One of these had been received by Liniers, who was evidently well inclined towards France, and who waited only for the issue of the contest to acknowledge the strongest; but as he had, at the same time, received instructions from the council of the Indies to proclaim Ferdinand VII., he was obliged to comply; and the ceremony was performed with solemnities and public rejoicings. But notwithstanding the known principles of the governor, the patriotic cause daily acquired strength; and it soon became as unpopular to speak French, as it ever had been to speak English. Arrangements were even made with the government of Brazil, for opening Buenos Ayres to British and Portuguese ships. Liniers, however, soon shewed himself hostile to these measures of reconciliation. He entrapped and sent to sea some members of the Cabildo, who opposed the recognition of Bonaparte; and prohibited the admission of all British goods into the La Plata. Affairs continued in this disturbed state until the 22d of May 1810, when a complete revolution took place in the government of this settlement. At a meeting of the inhabitants held with the consent of the viceroy, it was resolved to appoint a superior junta, who should exercise the powers of government until the establishment of a general junta for the viceroyalty. This body were bound by oath, faithfully to discharge their functions, punctually to observe the laws of the kingdom, and to maintain the integrity of that part of the dominions of America, in favour of their beloved sovereign, Ferdinand VII. In a proclamation which they issued upon entering into office, they declared their intention of increasing the force of the country; and required, in the first place, that all persons between 18 and 40 years of age, who were without any visible means of livelihood, or were unemployed in the public service, or in any profession, should immediately enrol themselves.

"The nations of the old world," said the junta, "never witnessed a spectacle so affecting as that which we have exhibited. When your spirit was supposed to be completely exhausted by the affliction you were plunged into by the melancholy situation of the Peninsula, you, by an heroic effort, resolved to avenge so many misfortunes, and to teach the general oppressor of Europe that the American character opposes to his ambition a still stronger barrier than the immense ocean, which has hitherto set bounds to his enterprises."

At the same time, however, that the junta declared their attachment to Ferdinand VII., a general disposition seemed to prevail among the provinces to shake off their dependence upon the mother country, until that monarch should be restored to his throne. They accordingly refused to admit Don Xavier de Elio, who had been appointed by the regency of Spain to take possession of the viceroyalty, leaving the acknowledgment of the regency, and consequently the viceroy's appointment, to the decision of the representative assembly, which was about to be held at Buenos Ayres. But the junta, in their answer to Lord Strangford's offer of mediation between them and the Peninsula, plainly intimate a determination to resist all authority which the government at Cadiz may assume in the direction of their affairs. "The Peninsula," say they, "is no more than a part of the Spanish monarchy, and that so mained, that it would be no small concession to put it upon an equality with America. It therefore follows, from this principle, that the Peninsula cannot hold any authority over America, nor this over that." The government of Monte Video, however, which had at first resolved to adhere to the proceedings of the inhabitants of Buenos Ayres, now received Elio as vicerey, and determined to acknowledge the regency of Spain. Hostilities were, consequently, commenced between the two cities. Buenos Ayres was blockaded by a squadron of English, Spanish, and Portuguese vessels. Frequent skirmishes took place between the troops of the junta and the Monte Videna, in which the former in general had the advantage; and, in a battle fought on the 18th of May 1811, at Las Piedras, Elio's force was completely defeated, when Monte Video was immediately invested by the Buenos Ayres army under General Arteaga. Several actions had also been fought by the revolutionists and the troops of Peru; the viceroy of that country having successfully checked, for a time, all attempts at a reformation in the government, and endeavoured to enforce the authority of the regency upon the other provinces. After various successes, the revolutionary army under Castelli (who had been appointed generalissimo by the junta) sustained a complete defeat from the Peruvians under Ygoneche; and it is said that Castelli and General Balcarse continued their flight for 100 leagues, without waiting for any of their followers! This disaster, and the discouragements which the besieging army before Monte Video had experienced from the strength of the place, and the facility with which supplies were obtained from Brasil, together with the bombardment of Buenos Ayres, which had commenced on the 14th of July by the command of Elio, induced the junta to listen to terms of accommodation. Elio had taken advantage of the present unpromising state of affairs, and had sent two senior officers, who were his prisoners, to propose a negotiation; intimating, at the same time, that he was not averse to the formation of juntas in the colonies, provided that fit boundaries were assigned to their functions, and proper restrictions were applied to their powers. The proposal was assented to by the junta; and the first conference between the viceroy and their accredited agent was to be held on board the Nereus British frigate, then lying in the La Plata, in August 1811. Of the result of this conference, however, no account has been yet received in this country; but by the latest intelligence from this quarter, dated September, we learn, that sanguine hopes were entertained by the inhabitants of both cities, that it would lead to a speedy and amicable accommodation.

Whatever be the fate of this country—whether it shall again acknowledge its subjection to the Spanish monarchy, or erect itself into a separate and independent state, the enlightened proceedings of the provisional junta will ever be remembered with gratitude and admiration by every friend of humanity and freedom, but particularly by the posterity
of the present oppressed and degraded sons of America. "We have b- held with regret," says the new government, in their decree of September 1811, "the miserable and debased condition of the race of Indians. Those our brothers, who are certainly the first-born sons of America, were excluded from the blessings and advantages of their native soil, and made the victims of ambition. They were not only buried in the most ignominious slavery, but were condemned to glut the avarice and luxury of their oppressors. A fate so humiliating could not fail to interest the sensibility of a government, which endeavored to promote the general happiness of the country, by carrying into effect the same liberal principles to which it owed its formation, and which must produce its continuance and felicity. The government, deeply impressed with these principles, and desirous of adopting all the means calculated to restore the Indians to their primitive rights, have declared them as capable of rising to all the ranks, offices, and posts, which have been the birth right of Spaniards, as any other class-of the inhabitants: and, to destroy the last link of the chain of servitude, have resolved, that henceforth, in all time coming, the tribute which the Indians paid to the crown of Spain shall be abolished in all the districts of the provinces united to the existing government of the river Plata."

We shall now conclude this article with a short account of the government and revenues of this viceroyalty, as they existed before its separation from the parent state.

The government of Buenos Ayres is vested in a viceroy, who represents the person of the Spanish monarch, and who exercises the supreme authority in every department of the state, civil, military, and criminal. He possesses the power, and is surrounded with all the splendour and dignity of a sovereign prince; and though his salary is extremely moderate, not exceeding 40,000 ducats, yet, from the numerous opportunities which he possesses of accumulating wealth, he may raise an annual revenue superior to that of any European subject. It is a common saying among the Spaniards: "The legal revenues of a viceroy are known, but his real profits depend upon his opportunities and his conscience." He is generally nominated only for three years, though he is sometimes enabled to purchase a prolongation of his government, by his influence at the court of Spain. The administration of justice is entrusted to the royal audiences of Buenos Ayres and Los Charcas, who take cognizance of all civil and criminal causes.—Their sentence is final in all lawsuits concerning property, not exceeding 10,000 piastras in value; but if the subject of dispute exceeds that sum, the cause may be carried by appeal before the royal council of the Indies in Spain. Those tribunals have the power of remonstrating against any of the political regulations of the viceroy, which involve in them a question of civil right, and of laying the matter before the king and the council of the Indies. They possess also the more substantial prerogative, of exercising all the functions of viceregal authority, upon the death of a viceroy, until another is appointed by the king. Each province has a governor, who is subject to the commands of the viceroy, and amena-

Buenos Ayres.

The junta declare the freedom of the Indian, and abolish the tribute.

Civil government.

The public revenue of this viceroyalty is derived from various sources, of which the following statement is given by Mr Wilcocke, in his History of Buenos Ayres. He divides it into four capital branches: 1st, What is paid to the king, as superior lord: 2d, The duties on commerce: 3d, What the king receives as head of the church: And, 4th, Profits arising from the monopoly of various branches of trade.

First Branch. Piastras.

Duties on the gold and silver coined at Potosi, 650,000
Profit on the comage, - - - 120,000
Tribute of the Indians, - - - 550,000

Second Branch. Piastras.

Alcava, or excise on the sale of goods, which is 4 per cent., - 385,000
Minor duties of excise, - - - 200,000
Stamp duty, - - - 32,000
Aduanas, or customs on imports and exports, including the almarajofizgo, or custom-duty, the averia, or convoy-duty, and the consulado, or town's dues; and amounting to 34 1/2 per cent. - 750,000

Carry over, 2,687,000
BUENOS AYRES.

Brought forward, 2,657,000

Buenos Ayres.

Third Branch.
Produce of the bulls of Cruzado,* 160,000
First fruits and ecclesiasstical annates, 30,000
Royal ninths of the tithes, 72,000

Fourth Branch.
Profits on the trade in quicksilver, tobacco, gunpowder, and paper, 350,000
— on the assiento of negroes, 200,000
— on the trade in the herb of Paraguay, formerly monopolized by the Jesuits, 500,000
Other revenues formerly belonging to that order, 400,000

Total amount in piastres, 4,396,000

Or, in sterling money, L. 989,775:0:0.

The whole revenue absorbed by the expenses of administration.

Of this revenue, however, no part goes to the parent state, the whole being absorbed by the expenses of the interior administration of the viceroyalty; and such are the sums necessary for supporting this splendid establishment, that very little is spared for the purposes of amelioration or of defence. "En effet," says M. Azara, "il est impossible, et au ministre, et a qui que ce soit, de savoir, si cette vice-royauté produït ou non quelque chose au tresor public, parceque, dans toute son etendue, a peine y a-t-il une caisse ou une administration que n'ait fait banqueroute. Un tres grand nombre n'a pas encore rendu ses comptes, et on n'a pas vérié ceux de plusieurs qui les avaient présentes."

According to Estalla, the population of this vast viceroyalty may be computed at 1,000,000 Spaniards and Creoles besides Indians: and Mr. Humboldt estimates the whole at 1,100,000, but at the same time informs us, that this estimation is not altogether accurate, as he has not been able to procure any satisfactory information on the subject. According to Azara, the province of Paraguay contains 97,500 souls, and the province of Buenos Ayres 170,900. See Azara Voyages dans l'Amerique Meridionale, depuis 1781, jusqu'en 1801. Wilccke's History of the Viceroyalty of Buenos Ayres. Humboldt's Political Essay on the Kingdom of New Spain. Coleti Dizionario Storico Geografico dell' America Meridionale. Helm's Travels from Buenos Ayres by Portos to Lima. (p)

BUENOS AYRES, the capital of the viceroyalty of Buenos Ayres, extends along the south side of the great river La Plata; and derives its name from the particular salubrity of its climate. It was originally founded by Don Pedro de Mendoza in 1535, and called Nuestra Señora de Buenos Ayres; but the colonists were so reduced by famine, and harassed by the continual hostilities of the neighbouring Indians, that in about four years after, the situation was abandoned as untenable. In the year 1550, however, the colony was re-established under the name of Santa Trinidad de Buenos Ayres; and in 1620 was erected into a bishopric, and constituted the capital of a province of the same name. But it was not until it became the seat of the viceroyal government, that it could vie in opulence and population with the principal cities of the southern continent. This city is built with great regularity and neatness, and is watered by several small streams which discharge themselves into the La Plata. The principal streets display both taste and opulence. They are broad and straight, with foot-paths on each side; but from the great scarcity of stone, unpaved in the middle, which renders walking very inconvenient during drought, from the quantity of dust which is collected and continually flying about. The houses are generally built of bricks or chalk, with flat roofs, but seldom exceed one story. Many of them have parapet walls on the top, from three to four feet high; and those of the more wealthy inhabitants have a vestibule, and a court surrounded by the apartments. The interior of these houses, however, correspond very ill with their external appearance. During summer, the rooms are covered with India netting, and in winter with European carpets; but from the indolence of the inhabitants, they are seldom kept clean; and that part of the town which is principally inhabited by mestizos and negroes, is nothing but a receptacle of filth. Almost every house is surrounded with a garden; and many have balconies, with lattice-work for containing shrubs and flowers. The principal square, or parade, which is very spacious, faces the La Plata, and is surrounded with superb buildings. On one side, fronting the river, is the castle or fort, which, considered as a post of military importance, is very insignificant; forty cannon of various calibres, and 700 men, are its only defence. It contains the palace of the viceroy, and a royal chapel. On the opposite side is the town-hall, and on the west side stands the cathedral, which is a new and spacious structure, with a cupola and portico of very elegant workmanship; but the interior of the building is rather too profusely decorated with carved and gilt work. The churches of St Francis and of the convent of Mercy,

* These bulls are published every two years, and contain an account from past offences, and a permission to eat several kinds of prohibited food during Lent, and on fast days. Monks are employed to dispense them, and to extol their virtues; and they are greedily bought up by the credulous and ignorant vulgar, who look upon them as essential to their salvation. The price varies according to the rank of the purchaser. At a late Predicacion for Peru, including Paraguay, there were issued—

Pesos 63, 887 3
Or, L. 143, 298, 6s. 5f. sterling.
are built with a cupola and steeples nearly in the
same style as the cathedral. In the former is a beau-
tiful painting of the Last Supper, by an Indian neo-
phyte. The frame is composed entirely of feathers
of a bright gold colour, so contrived as to imitate
the most correct carving and gilding, and the difference
cannot be discovered by the nicest observer till it is
touched by the hand. The church of St John, which
stands on the skirts of the town, is appro-
priated entirely to the use of the Christian Indians.
The other public buildings are two hospitals, one for
men and the other for women, an orphan hospital, a
foundling hospital, and a college where they teach
grammar, philosophy, and theology. These edifices
are built of a beautiful white stone, which is found
not far from the town, and which gives them a light
and elegant appearance. The chapter of the cathed-
dal consists of a bishop, whose annual revenue is
from 18,000 to 20,000 piastres, three dignitaries, and
two canons. Besides these, there are in the city of
Buenos Ayres above 190 ecclesiastics, independent
of four numerous monasteries of Francisicans, Domi-
nicans, and of the fathers of Mercy and of Bethleem,
and two convents of nuns.

The environs of the city for about three leagues,
present a beautiful and well cultivated country, full
of gardens and groves, and diversified with fields of
wheat and maize. Here almost every person in easy
circumstances has his country house, called *qunita,*
a large garden which supplies him with many neces-
saries of life, and a variety of fruits and plants; all
their wine, however, is brought either from Spain or
Mendoza. Beyond these fields are immense tracts of
meadow, covered with continual verdure, and
filled with innumerable flocks of wild horses and oxen,
which renders provisions here very cheap. Accord-
ing to Estalla, a thousand head of cattle are daily
slain in the neighbourhood for the use of the city,
which are brought in carts to the market, where
they are examined by a sworn provoditor; and
Helms tells us, that the largest ox is often sold
for a piastre, or 4s. 6d. and a good horse for two
piastres.

The greatest inconveniences under which the in-
habitants of Buenos Ayres labour, are the difficult
and dangerous navigation of the La Plata, and the
want of a safe and commodious harbour. On account
of the numerous inlets, shoals, and rocks, with which
this river abounds, and the frequency of the *pamperos,*
which render a storm here more dreadful than upon
the ocean, vessels making for this city must come to
anchor every night; and in the most moderate wea-
ter, it is necessary to send a pilot to sound the way
for the ship. But the danger does not even end with
the voyage: for there is no part on the coast where
vessels of any burden can enter nearer than the bay
of Barragan, which is about seven leagues distance;
and the anchorage ground opposite to Buenos Ayres
is nearly three leagues from the shore. All their goods
must consequently be landed in lighters or boats,
which enter a small creek at the mouth of the Rio
Chuelo, about a quarter of a league from the town,
to which they are conveyed in carts; and the vessels
generally fall down to the bay of Barragan to refit
and wait for their cargoes. It was to remedy these
inconveniences, that the court of Spain ordered a
settlement to be established at Monte Video in 1726,
where nature has formed one of the finest havens in
the world. At this port, the merchandise which is
imported from Spain is debarked, and carried in boats
to Buenos Ayres, from whence it is disseminated
throughout the vice-royalty. For an account of the
commerce of this city, see the preceding article,
p. 57.

The number of inhabitants in Buenos Ayres has
been estimated very differently by different travellers.
Helm makes it from 25,000 to 30,000; while Sir
Home Popham carries it so high as 70,000. Forty
thousand is the estimate of Azara, which we suppose
to be the most correct. South Lat. 34° 36' 28",
West Long. 58° 31' 15". (p)

BUFFALOE. See Mammalia.

BUFFON, GEORGE LOUIS LE CLERC, a cele-
brated naturalist, was born at Montbard in Burgundy,
on the 7th of September 1707. His father was Ben-
jamin LeclercBuffon, counsellor of parliament in Bur-
gundy, and the maiden name of his mother was
Madeinoiselle de Merlin.

Being destined by his father for the profession of
the law, Buffon commenced his studies at the college
of Dijon; but the passion which he began to feel for
the mathematical sciences, withdrew his attention
from every other subject. The Elements of Euclid,
and the works of the Marquis de L'Hospital, were
the first books that were put into his hands; and such
was his attachment to the former, that he always
kept it in his pocket, and was often observed to
retire from his companions at play, and to attempt, in
time solitary corner, the resolution of any problem
with which he had been perplexed.

The success that attended these youthful exer-
cition was sufficiently brilliant to create new exci-
tements to his genius. At the age of twenty, he is
said to have discovered the binomial theorem, with-
out knowing that he had been anticipated by New-
ton; and when at a future period of his life he was
asked by M. Herault de Sechelle, why he had never
published this fact in any of his works, he replied,
that "nobody was obliged to believe it." In 1727,
Buffon became acquainted at Dijon with the young
Lord Kingston, whose tutor had paid particular at-
tention to the sciences. In consequence of this con-
nection, he determined to travel, and after following
his friend into England, he accompanied him to
Italy. In that delightful country, sacred to litera-
ture and the arts, and endeared to every scholar by
associations the most interesting, Buffon was en-
chanted only by the phenomena which nature pre-
sented. The works of human skill, though exhib-
ited in their most perfect form, had no charm for a
mind passionately devoted to the philosophy of na-
ture. It was in the deep valley, among the rugged
precipices, on the summits of the lofty mountains,
or among the torrents of lava which had formerly rush-
ed from the bowels of the earth, that Buffon began
his sublime speculations on the ancient convulsions
and revolutions of the globe.

About this time, in the year 1728, he succeeded
to the estate of his mother, which brought him an
annual income of about £12,600, and which enabled
him to carry on, in affluence and independence, those scientific pursuits to which the rest of his life was devoted. On his return from Italy to France, he repaired to Angers, where he quarrelled with an Englishman, and having wounded his adversary, he took refuge in Paris. From Paris he went to England, where he remained only three months; and on his return to France, he began that scientific career which he afterwards pursued with so much success and glory.

The first work published by Buffon, was a translation of Hales' *Vegetable Statics*, which appeared in 1735, and which was followed in 1740 by a translation, from the Latin, of *Newton's Fluxions*. The prefaces with which these translations were enriched, were distinguished by that dignity of style which characterised all the subsequent works of this illustrious naturalist.

With the view of applying the physical sciences to objects of real practical utility, Buffon made a course of experiments on the strength of wood, from which he appeared, that, in order to give a ligneous consistency to the alburnum, it is necessary to strip the bark from the foot of the tree at the time of the sap, and to allow it to dry, and to wither after this operation. The attention of Buffon was likewise turned to the burning mirrors of Archimedes, and he had the honour of being the first among the moderns who constructed an instrument approaching in its efficacy to the supposed invention of the Syracusan geometer. In the year 1748, he proposed a lamp *à échelons*, which was executed about thirty years afterwards by the Abbé Rochon. See *Burning Machine*, where a full account of Buffon's Burning Mirror will be found.

In the year 1739, Buffon succeeded M. Dufai as Intendant of the Royal Garden and Cabinet, an event which fixed the resolution which he had formerly made of devoting himself wholly to the study of natural history. He now began to collect materials for his great work, and in 1744, he published a part of it under the title of *A Theory of the Earth*, which he afterwards included in his larger work. The first volume of his *Natural History* appeared in 1749, and the book was completed in 1767, in fifteen volumes 4to, or 31 vols. 12mo.

The freedom of his religious sentiments, which appears in all his works, provoked the indignation of the Sorbonne, but he had the good sense to dissipate the fears, and to disarm the hostility of the learned doctors, by an explanation with which they were completely satisfied. To the external duties of religion he was uniformly exemplary. He regularly attended church and went to mass; and every Sunday he distributed a Louis among the neighbouring poor.

In the year 1743, Buffon was admitted a member of the French academy, and at his admission he delivered a discourse, entitled, *Philosophical Remarks upon Style*, which was regarded as one of the finest specimens of composition. In 1752, he married Mademoiselle de Saint Belin, by whom he had a son, who seems to have inherited a portion of his father's talents. In the gardens of Montbard he erected a simple column in honour of his father, with this inscription:

*Excellae turri humilis columna*  
*Parenti suo filius Buffon, 1785.*

On seeing this monument, Buffon burst into tears, and said, "Son, this will do you honour." In the year 1795, this young man was condemned to death by the Revolutionary Tribunal; and when he mounted the scaffold, he exclaimed, with dignity and composure, "My name is Buffon!"

After Buffon had completed his History of Quadrupeds, a severe indisposition, which lasted nearly two years, interrupted the progress of his labours, and prevented him from finishing his History of Birds, the two first volumes of which appeared in the year 1771. In this work he received great assistance from M. Guenau de Monbéliard, whose mode of thinking and writing could scarcely be distinguished from his own. The third, fourth, fifth, and sixth volumes were the joint production of both these naturalists; and the labours of each were marked out by their own names. In the seventh, eighth, and ninth volumes, Buffon was assisted by the Abbé Bexon, who formed the nomenclature, and drew up the greater part of the description.

In 1771, Louis XIV. conferred upon Buffon a singular mark of his favour, by erecting his estate into a comté and granting him the smaller customs.* The French king was even anxious to be particularly acquainted with Buffon, and after inviting him to Fontainebleau, where he consulted him on several points relative to the cultivation of wood, he offered him the administration of all the forests in his dominions, a situation which Buffon refused to accept.

In 1773 and 1774, he published in 2 vols. 4to, a supplement to his Natural History, containing an introduction to the History of Minerals. In 1777, he added a supplementary volume to his History of Quadrupeds; and in the same year he published another 4to volume as a supplement to the History of Man. In 1778, he published a fifth 4to volume "On the Epochs of Nature," which is a continuation and an enlarged explanation of his Theory of the Earth; and in 1782, he completed his supplements by a sixth 4to volume on Quadrupeds.

In the prosecution of these labours, by which the science of natural history has been so greatly enriched, Buffon was indefatigable in his application, and in general employed fourteen hours every day in his study. Even in his early life, when he frequented the evening parties at Paris, and did not return to Montbard till 2 o'clock in the morning, he ordered a boy to call him at five, and to drag him out upon the floor if he shewed the least disposition to linger in bed. After he was dressed, he dictated letters, and regulated his domestic affairs; and at six o'clock he resumed his studies at the pavilion, called the tower of St Louis. This pavilion was situated at the ex-

---

* This act of the French king has been generally misunderstood. In one of his letters to Mr Smellie, Buffon himself observes, "You likewise say that the king ennobled me, as a mark of his satisfaction with my work. I assure you, that I was noble before, as well as my ancestors, and that the king only granted me another title (un titre de plus) in erecting my estate into a comté." *Kerr's Life of Smellie*, vol. ii. p. 132, 138.
trinity of the garden, about a furlong from the house; and the only furniture which it contained
was a large wooden secretary, and an arm-chair. No books or pictures relieved the naked appearance of
the apartment, or distracted the thoughts of its learned possessor. The entrance was by green folding
doors, the walls were painted green, and the interior had the appearance of a chapel, on account of
the elevation of the roof. Within this was another cabinet, where Buffon resided the greater part of
the year, on account of the coldness of the other apartment, and where he composed the greater part of
his works. It was a small square building, situated on the side of a terrace, and was ornamented with
drawings of birds and beasts. Prince Henry of
Prussia called it the cradle of natural history; and
Rousseau, before he entered it, used to fall on his
knees and kiss the threshold. At nine o'clock Bu
fon usually took an hour's rest; and his breakfast,
which consisted of a piece of bread and two glasses of
wine, was brought to the pavilion.* When he had
written two hours after breakfast, he returned to his
house. At dinner, he spent a considerable portion of
time, and indulged in all the gaieties and trifles
which occurred at table. After dinner, he slept an
hour in his room, took a solitary walk, and during
the rest of the evening, he either conversed with his
family or guests, or sat at his desk examining the pa
ters that were submitted to his judgment. At nine
o'clock he went to bed, to prepare himself for the
same routine of exertion and pleasure. In this man
ner were spent no fewer than 50 years of his life,
which were not marked by many of those occur
rences which give variety to the lives of less recluse
and more active philosophers. With a strong consti
tution, he was for a long time exempted from those
debilities which old age generally brings along with
it; and, though tortured by the cruel disease of the
stone, which shortened his existence, he continued
his labours under the severest bodily sufferings; and,
to use the expression of Condorcet, it was only for
a few days that he ceased to be that illustrious man
whose genius and labours had filled Europe for more
than forty years. He retained his reason till within
a few hours of his death, which happened on the
16th of April 1788, in the 81st year of his age.
When his body was opened, no fewer than 57 stones
were found in his bladder; and it was the opinion
of the faculty, that the operation of lithotomy might
have been successfully performed, but Buffon would
never consent to this mode of relief. After the body
was embalmed, it was presented at St Medard's
church, and afterwards conveyed to Montbard, to
be interred, according to his orders, in the same
vault with his wife. A great concourse of academicians,
and of persons of rank and literary distinc
tion, attended the funeral of Buffon; and a crowd of
20,000 spectators assembled in the streets through
which the body was to pass. The monument erect
ed to the memory of this distinguished naturalist,

* The following account of Montbard is given by Millin in his Travels through the South of France in 1804 and 1805. The anecdotes are extremely interesting, and could not easily have been transcribed into the text.

"We were introduced by Lapierre, who had been gardener to the Count de Buffon during 43 years, and still takes care of this place for the widow of his unfortunate son. The house seems the large habitation of a tradesman, rather than the residence of a man of rank. It is in the High Street, and the court is behind. You ascend a staircase to go into the gar
den, which is raised on the ruins of the ancient mansion, of which the walls make the terraces. On the top, there still remains an octagon tower, where Buffon made his observations on the reverberation of the air. The elevation of this tower is an hundred and forty feet above the level of the little river Braine, which crosses the town. This singular and picturesque garden is well worthy of the notice of the curious. It is not so well taken care of as in the time of his illustrious proprie
tor; but the numerous foreign trees which he had collected, form several agreeable arbours. The kitchen garden is to the south-west, on seven different terraces.

"Lapierre shewed us all those places in which his master most delighted; and particularly the room in which he laboured
during the heats of summer. It is in a pavement, which is called the Tower of St Louis. Lapierre made us, above all, take
notice of another closet, situated on the side of a terrace. Buffon used to reside there a great part of the year, because the other was often too cold. From this pavilion, the prospect extends in every direction, and is the finest in the town. The sun, make fast the shutters and the doors, and work for two hours by the light of wax-candles. In the time of Buffon, this
study was ornamented with drawings of birds and beasts. What pleasure we should have had now to have contemplates
those representations; to have seen the old leather chair; the table of black birch; the large walnut-tree secretary which de
corated this apartment; the old elbow chair in which Buffon used to sit with the engraving of Newton before him! But
the brigands of the revolution envied this luxury to men of letters; they have pillaged this sanctuary of the muse—the
simplicity of which ought to have been its protection against their sacrilegious rapacity. We could not be prevailed upon
to leave this cabinet; we imagined we saw Buffon in his grey silk night-cap, and in his red night-gown with white stripes; we
thought that we heard him intermix with the familiar expressions, 'C'est ça, tout ça, pardi!' those profound and strik
ning remarks which manifested his genius. We, however, quitted these gardens to see the rest of the town, that we might
proceed on our journey early the next morning. In descending, we passed before the column that M. de Buffon, the son,
raised to the memory of his father. They have permitted it to remain, but have effaced the inscription, which consecrated
filial affection.

"Lapierre shewed us the house of Daubenton, the assiduous companion of the labours of Buffon, and took us up the
same staircase which he ascended every morning at five o'clock, to go to the study that we had just visited. We went to the
court, situated on very high ground; we saw not any of the monuments consecrated to the memory of Buffon. The humber
tomb which was raised to the memory of his interesting wife, Madame de Saint Bellin, is also no more to be seen.
We arrived at the church by a flight of steps, but there is a way for carriages. Near it is a little esplanade, and an alley
bordered with trees. It was here that Buffon, after having assisted at high mass, which he regularly attended, walked in a
coat richly covered with lace, escorted by his son, accompanied by Father Ignatius, and surrounded by peasants.

"We should have liked much to see the forge from which the greater part of the revenues of Buffon were derived; but
we must have gone a league beyond the town. The sheep-fold in which the illustrious Daubenton made his experiments for
the improvement of wool, would also have deserved our attention; but there are no longer any animals kept there."—See
Millin's Travels, chap. viii.
was destroyed during the fury of the revolution.

The leaden coffin in which he was deposited, was even opened and carried off, and his very remains were left unburied. A citizen who loved the sciences, and who was indignant at this profanation of genius, went to Paris to complain of it, and proposed to the committee of public instruction to place Buffon in the Pantheon. This attempt, however, was unavailing; and the committee were unanimously of opinion, that the place would be profaned by the presence of a man who was connected, like Buffon, with the aristocracy of the country.

In his external appearance, Buffon was distinguished by a fine commanding figure, and his countenance exhibited the most unequivocal traits of superior intelligence. When he walked, he carried his head high, scarcely deigning to look at the ground; and such was the perfection of his general appearance, that the picture of man which he has drawn in his Histoire de L'Homme is said to be taken from himself. A love of magnificence and luxury, and even of show, was one of the predominant passions of our author. Even in the latter part of his life, when old age and disease might have subdued this silly passion, he had his hair dressed twice or thrice a day. Every Sunday he exhibited himself in a rich lace garment, attended by his son and by several peasants. His natural vanity was greatly increased, by the admiration which his writings everywhere inspired. He was in the habit of reciting his works to those who visited him, and of requesting them to read them aloud; and his favourite parts were, the discourse of the first man, successively animated by the development of his different sensations, the description of the deserts of Arabia in the article Chameau and another description in the article Kamichi. His own writings were frequently the subject of his commendation; and when speaking of men of talents, he would often say, that able men were very rare; and that he knew only five great geniuses, Newton, Bacon, Leibnitz, Montesquieu, and himself. The love of glory, however, was the ruling passion of Buffon. It was for this high prize that he laboured during 50 years. The attention which he paid to his style, and the repeated correction and revision which all his works underwent, were less the result of a difficulty which he felt in composing, than of that love of reputation which never forsook him. He tells us, indeed, of the luxuries of genius, and of the gratification with which mental labour always inspired him. "It is for this gratification," said he, "yet more than for glory that I have toiled. Glory comes if it can, and mostly does come. This pleasure is greater if you consult no books: I have never consulted authors till I had nothing left to say of my own." This noble passion, which in the preceding expressions he seems to measure to disavow, appeared more unequivocally at the close of his life, when he was enabled to anticipate the opinion of posterity. He declared that he had no fear of death, and that the hope of immortal renown was the most powerful deathbed consolation. The vanity of few authors has been so much flattered during their life as that of Buffon. We have already seen that Louis XV. shewed him the most particular marks of his favour. The Empress of Russia honoured him with her correspondence. She ably criticised some of his opinions, and exerted herself in forwarding his researches in natural history throughout her vast dominions. When Prince Henry of Prussia visited him at Montbard, he wrote these remarkable words: "Si j'avais besoin d'un ami, ce seroit lui; d'un père encore lui; d'un intelligence pour m'éclairer, oh! quel autre que lui." Helvetius and Montesquieu were among the particular friends of Buffon. The Abbé Raynal ranked him above Pliny and Aristotle. Even Voltaire paid due homage to his talents; and M. Lebrun, one of the finest poets of France, addressed a poem to him highly complimentary to his genius and talents. Such indeed was the extent of his fame, that during the American war, the very pirates transmitted to Buffon the boxes that were addressed to him, while they detained those, of the King of Spain.

The social qualities of Buffon were much inferior to those of his mind. There was nothing remarkable in his conversation, though it was on some occasions marked by the peculiar features of his genius. It was probably on this account, that he secluded himself from the gay and learned society of Paris, where his genius would have been obscured amid the dazzling brilliancy of wit and sentiment which were then so conspicuous in the metropolis of France. He often declared his preference of the writings to the conversation of the learned; and he seems to have acted under the impression, that information should be expected only in the works of authors, and that the common topics of the day were the only proper subjects of conversation. Hence he was fond of trifling in company, and sometimes indulged in a licentiousness of conversation, which often made the ladies blush and retire. While he was dressing, he listened with avidity to the scandalous chronicle of Montbard; and the Capuchin Ignatius, who often acted as his valet, was in the habit of amusing him with his jokes.

There was very little sensibility in the character of Buffon. In speaking of Rousseau, he observed: "Je l'aimais assez; mais lorsque j'ai vu ses Confessions, j'ai été mis de l'extérieur. Son âme m'a révélé!" His mind was probably too much occupied with study to enter into the views and feelings of that singular character.

In the moral and religious character of Buffon, we have much to commend, and very little to admire. When Genius appears without the Virtues, she is shorn of her loveliest beams. Her dazzling splendor may command our admiration, but she wants the qualities which can alone win our affections. Secluded as Buffon was from the temptations of gay life, and devoted wholly to the study of nature, we might have expected some display of the domestic virtues; but our expectations are sadly disappointed by the history of his private life. His habitual infidelity to his wife was accompanied with most of the vices which generally spring from that odious crime. Delicacy forbids us to repeat what some of his biographers has related on this subject, and what we would fondly hope has been given with some exaggeration.

The whole of Buffon's writings indicate the free sentiments which he entertained respecting religion,
though his conversation was more the vehicle of irre-
ligious sentiments than his works. It would neither
amuse nor instruct our readers, to detail the Anti-
christian sayings which the folly of his friends has
divulged, and to which the folly of his biographers
has given additional currency. It is sufficient to
state the melancholy fact, and to point out the gross
inconsistency of his conduct, in performing all the
ceremonies and external duties which the religion of
his country enjoined. He considered a system of faith
as necessary for the multitude, and regarded all those
as madmen who openly opposed it; but it may be fairly
questioned, whether this kind of support was not
more dangerous, than the avowed hostility of Vol-
taire and Diderot.

The opposition which Buffon uniformly makes to
the doctrine of final causes, and his unwillingness to ac-
knowledge those numerous marks of benevolence and
wisdom, which appear in every part of creation, are
perhaps more inexcusable than his infidelity. The
energy of nature, resulting, as he imagines, from the
great laws of attraction and impulse, is with him the
cause of all that is sublime and beautiful in the ma-
terial world; and if the Creator is accidentally na-
mled, he is brought to the bar of human wisdom, and
arraigned for all that appears defective in his
works, to the shallow penetration of his creatures.

From the moral and religious defects of our au-
 thor, we turn with pleasure to contemplate the sin-
gular genius which is displayed in his works. In
his Natural History, Buffon has described no fewer
than four hundred species of animals. In the anato-
mical description, he was assisted by the celebrated
Dauben
ten, * but the rest of the work was the pro-
duction of his own genius. In the first volume, he
gives a new theory of the earth, and a discourse
on the method of studying and treating natural his-
tory. The second and third volumes are devoted to
an explanation of his system of generation, and to
his history of man, in which he has painted, with all
the charms of eloquence, and of the most alluring
philosophy, the progress of man under all the va-
rious circumstances of his existence. The fourth
and fifth volumes contain the history of the domestic
animals. The account of carnivorous animals begins
the sixth, and is continued through the seventh,
eighth, and ninth volumes. The tenth, eleventh,
twelfth, and thirteenth volumes, in which Buffon
has abandoned every kind of classification, contain
the description of individual species; and the four-
teenth and fifteenth volumes are occupied with the
history of apes.†

The history of birds he found more difficult to
execute than that of quadrupeds, and the interrup-
tion of ill health rendered it necessary for him to
avail himself of the assistance of his friends. The
articles written by Buffon in the second volume, were
those on the pigeon, the ring dove, the turtle dove,
and some pages of the history of the cock. His articles in
the other volumes are marked with his own name; and
one of these in particular, viz. the history of the swan,
has been much admired. Buffon read this article to
Prince Henry of Prussia, when he visited him at

Montbard; and, as a mark of his delight, the prince
sent Buffon a service of porcelain, in which swans
were represented in every attitude.

For the particular views of Buffon in geology, and
in other branches of natural history and physics, we
must refer our readers to his own writings, or to the
different articles in our work, in which these subjects
will be amply discussed.

In estimating the merits of Buffon as a philoso-
pher and a naturalist, we must withhold from him
that substantial praise which is due only to the high-
er efforts of invention and discovery. The brilliant
eloquence and the imposing dignity of his style, have
perhaps never been equalled; but his passion for fine
writing has often led him from the path of simple
truth, and has given a currency to speculative opin-
ions which profound science will never recognise.
His History of Man, his Theory of the Earth, and
his Epochs of Nature, contain the finest specimens
of philosophical discussion and refined taste; but it
is that species of philosophy which amuses and asto-
nishes, not that which instructs and enlightens us.
By confounding facts with opinions—by pushing his
general views too far—by moulding to his precon-
ceived notions the various facts which would other-
wise have overturned them—by attempting, in short,
to explain every thing before the progress of science
has furnished the necessary materials—Buffon has
maintained a series of hypotheses which, in the fu-
ture history of knowledge, will be regarded only as
philosophical romances, to which nothing could have
given currency but the magical influence of his elo-
quence and genius. The mass of authenticated facts,
however, which is contained in his works, and the
rank to which he has raised the science of natural
history, entitle him to that fame which he now enjoys,
and to that immortality which he himself anticipated.

In other branches of general physics, the genius
of Buffon was happily displayed. His discovery
and explanation of Accidental Colours (see
that article), his experiments on the strength of
wood,—on the propagation and motion of heat,—
and his invention of a burning mirror,—entitle
him to high praise, and will be noticed in the dif-
ferent articles of our work. The Natural History
of Buffon was translated by our ingenious country-
man, Mr Smellic of Edinburgh, and was published
in 1781, in 8 vols. 8vo., to which a 9th volume was
added in 1786. Some of the supplementary vo-
 lumes were also translated by Mr Smellie, but they
have not been given to the world. The History of
Birds was translated by Mr Leslie, and published
in 1793, in nine vols. 8vo. The whole of Buffon's
works were lately published at Paris, under the title
of Histoire Naturelle generale et particuliere, Nou-
velle Edition, accompagnée de Notes, et dans laquelle
les Suppléments sont insérés dans le premier texte, a la
place qui leur convient. Redige par G. S. Sonnini,
in 113 vols. 8vo. The work is thus divided:

Minerals, - - 12 Reptiles, 8
Animals, - - 18 Fishes, 13
Apes, - - 2 Cetacea, 1

* These descriptions were left out by Buffon in the second edition of his work.
† We have here followed the quarto edition of Buffon's works.
BUFFONIA, a genus of plants of the class Tribandra, and order Digenya. See BOTANY, p. 127.

BUGIA, or BOUEJAH, a sea-port town of Algiers, and formerly capital of a province of the same name, is built on the ruins of Salda, at the bottom of a high mountain, looking towards the north-east; and is watered by the river Huet el Quibir, supposed to be the Nasava of Plutarch. It is surrounded with a stone wall, and strongly defended by a castle, which stands on the summit of the mountain, and a garrison of nearly 300 Turkish soldiers. This force, however, is unable to repress the disorders and depredations of the savage tribes who dwell in the neighbourhood, and who often commit, in the very heart of the city, the most flagrant acts of rapine and barbarity. These tribes generally attend the market with oil, wax, dried figs, &c. and during the morning are very peaceable and regular; but the day seldom closes without confusion and outrage.

The harbour of Bugia is formed by a neck of land, jutting out into the sea, and is defended by two forts. The principal trade of the inhabitants consists in plough-shares, spades, and other instruments of agriculture, which are manufactured from the iron supplied by the adjacent mountains; and considerable quantities of oil, wax, &c. the produce of the surrounding country, is shipped here for the Levant. This town submitted to the Spaniards in 1510, and five years after resisted all the attacks of the corsair Barbarossa; but it was retaken by the Algerines, after the luckless expedition of Charles V. in 1541. It was bombarded in 1671, by Sir Edward Spragg, who greatly damaged the town and castle, and killed many of the inhabitants. Bugia is 80 miles east of Algiers.

N. Lat. 36° 34', E. Long. 5° 10'.

BUGVINILLEA. See BOTANY, p. 203 & 272.

BUILDING. See Civil Architecture.

BULAMA, BULAM, or BOULAM, the most eastern island of the Bujuga Archipelago, on the western coast of Africa, lies in N. Lat. 11° 5', and W. Long. 14° 30'. It is situated on the north west of the embouchure of the Rio Grande, and is separated from the main land on the east by a channel, which forms an excellent and capacious harbour about two miles wide, with a good clear bottom, and water sufficient for the largest ships to ride in safety within a cable's length of the shore. The length of this island is about seven leagues, and its breadth varies from two to five.

Bulama rises from the sea with a gentle ascent for the space of two leagues, to a few hills, serving as the basis of some considerable mountains in the centre of the island, which are crowned with woods, and interspersed with luxuriant vallies. It is enriched with lofty fruit and forest trees, forming a verdant belt, in some places two or three miles broad, and is intersected by several rivers, which, issuing from the mountains, beautify and fertilize the country. Whatever is required for the necessaries, the comforts, or even the luxuries of savage life, are here produced in great profusion; and, independent of the climate, there are few countries better calculated, both by its situation and productions, for all the purposes of a rich and extensive commerce. Lying in the vicinity of many navigable rivers, which extend far into the continent, and which would greatly facilitate a trade with the internal parts of Africa; and possessing a deep and luxuriant soil, adapted to every species of cultivation, it offers itself as a most desirable settlement to any European nation. Cotton, indigo, coffee, and rice, are its spontaneous productions; and pine apples, limes, oranges, grapes, plums, cassada, guava, Indian wheat, melons, pumpkins, tamarinds, bananas, and many delicious fruits, grow here in great abundance. Sugar and tobacco, and indeed all the other productions of our West India islands, may also be cultivated here in equal perfection; and, considering the richness of the soil, to much greater advantage.

"The island," says Captain Beaver, "is covered with wood of various sizes and grain; from that of the majestic oak, to the most diminutive shrub; and from the close texture of the iron wood, to the soft porous grain of the pullam or cotton tree." From these, great advantages may be derived both in the construction of houses and in the building and repairing of vessels. The maicheir, of which the naturalized Portuguese in this part of Africa construct their decks, is very easy to work, is never perforated by worms, and is deemed preferable to what is generally employed for this purpose. In the marshy spots are produced a particular species of wood, the inner bark of which is made into a kind of tow which never rots; and also a species of reed, from which very good cordage is manufactured by the negroes.

On the southern side of the island are extensive savannahs, or natural meadows, well stocked with oxen and wild horses; and stags, goats, buffaloes, and elephants, are to be found in great numbers; while the lion, tiger, jackal, and other beasts of prey, except the hyena, though natives of the neighbouring continent, are unknown in Bulama. Vast flocks of game are seen all over the island; and doves, guinea fowls, and various other birds, celebrated for the beauty of their plumage, breed undisturbed in the woods. The shores, also, afford a great variety of fish, particularly plenty of excellent turtle.

The climate, as must be expected from the latitude of the place, cannot but be insalubrious; but it might be greatly improved by clearing and cultivating the country. According to Captain Beaver's observations at noon, the thermometer was never lower than 74°, and seldom higher than 96°, the medium temperature being 85°. A fine sea-breeze which sets in about mid-day, renders the evenings temperate and pleasant; and the general difference between the temperature of noon and night, is from 20 to 30 degrees. The dew, which begins to fall immediately after sunset, produces a sort of chilliness in the air, which would induce some to put on warmer clothing; and even to light a fire in their houses; and the absence of the sun for twelve hours, which gives the earth time to cool, renders the mor-
The rainy season generally begins about the month of June, and continues until
the middle of October. During this period, however, there are often considerable intervals of clear
weather, particularly in the first and last months; but towards the middle of the season, the rain falls
in perfect torrents. The approach and conclusion of these rains are generally indicated by tornadoes,
which arise chiefly in the eastern part of the compass. These, however, are neither so violent nor so destructive,
as those terrible hurricanes which are so frequently experienced in the West Indies. They always give sufficient warning of their commencement,
so that every precaution may be taken against their influence; and their usual duration is from one to three hours. Their beneficial effects are of the utmost consequence in these countries. They conduct
greatly to the salubrity of the climate, by purifying the air, and by dispelling all those deleterious vapours with which it would otherwise abound. They begin about the middle of May, and are most frequent in the months of September and October, and cease about the beginning of November. The seasonings fever in Bulama, to which every stranger is subject, is much the same as that of the West Indies, though it has been represented by some as much more dangerous and malignant; and it has even been maintained by a respectable physician, that the yellow fever was originally brought to the West Indies from the island of Bulama.

The original inhabitants of Bulama were the Biafaras, (see Biafaras), who, after a long and sanguinary war, were expelled by the Bijugas, a warlike nation, inhabiting the neighbouring islands. The time of the Biafara expulsion is not exactly known, but it must have taken place previous to the end of the 17th century; for when the French visited the island in 1699, it was entirely uninhabited. The Bijugas, instead of residing on their new conquest, contented themselves with visiting it every year for the purpose of hunting. They here procured elephants tusks, which they bartered with the Portuguese for tobacco, rice, guns, powder, and shot. With the skin of the buffalo they covered their shields, and that of the deer supplied them with their only clothing. A few fields of rice, millet, and other pulse, were annually cultivated on its western end; and immediately after harvest, which was always plentiful, they returned to their own country. This island, since its first discovery, has often attracted the attention of Europeans. It was strongly recommended to the French government by M. de la Brue, director-general of the French Senegal Company, who visited it in 1700, as a most eligible situation for a colony; and about 60 years after, the recommendation was repeated by the Abbé Demance, who lived for some time on the adjacent coast; and also in 1787, by Barber, an Englishman, then residing at Havre de Grace. Their schemes, however, were never put in execution, and the breaking out of the revolution prevented that power from looking beyond its European dominions. During the agitation of the question respecting the abolition of the slave trade, the attention of the English was often directed to the civilisation of Africa, as the best means of accomplishing that benevolent object. With this generous intention was formed the Sierra Leone Association; (see Sierra Leone)—and, with a similar design, a settlement was proposed to be established on the island of Bulama, which was carried into execution in 1792. Of the views, progress, and failure of this unfortunate expedition, Captain Beaver has furnished us with a very minute account in his African Memoirs, to which we must refer our readers for the particular details; and shall confine ourselves, in the remainder of this article, to a succinct sketch of the more prominent circumstances which led to its unsuccessful issue. The object of those gentlemen who were the original promoters of the scheme, according to Captain Beaver, was purely the civilisation of the Africans; and the method which was proposed for the attainment of this desirable object, was the cultivation of the country by free natives, hired for the purpose, by which they might be induced to habits of labour and of industry, and by opening a commercial intercourse between Europe and the African continent, which might eventually lead to the introduction of religion, letters, and civilization, into the very heart of the country, and thereby raise that degraded people to their proper rank in the society of nations. We cannot enough admire the disinterested spirit which dictated this benevolent design; and we have to regret, that it was undertaken with so little precaution, and with such inadequate means.

The expedition, consisting of three vessels, the Calypso, Hankey, and Beggar's Benison, with the colonists on board, consisting of above 280 souls, men, women, and children, sailed from the Downs on the 6th of April 1792. This expedition was entrusted to the command of Captain Dalrymple, and a council of 12 gentlemen, the greatest number of whom had been officers in the navy or army. On the 25th of May, the Calypso, having parted from her consorts, anchored off the island of Bulama. The colonists, unaccustomed to the confinement and deprivations of a sea-voyage, were eager to get on shore, and to take possession of their new habitation. But instead of endeavouring to secure the friendship of the natives, or to purchase the island, as was their original intention, they landed without order or precaution, seemingly regardless of their own safety, or of the authority of their commanders. Every one did whatever he pleased. Some erected huts and tents; others wandered through the woods in search of game and fruits, and returned to the ship or not as they thought proper in the evening. During the first night, their tents, and whatever they had left on shore, were carried off by the natives, which roused them a little to a sense of danger, and induced them to erect a large shed, inclosed with planks, as a place of residence and defence. But the same irregularity prevailed. Captain Dalrymple had either lost all influence and control, or had not firmness to exercise it. The colonists became turbulent and unruly, and confusion and anarchy reigned in every quarter. Instead of being prepared against any unforeseen circumstances that might—

happen, or pursuing such measures as were necessary
for the success and preservation of the colony, they
were scattered over the island, each in pursuit of his
own favourite amusement. The Biijgkas had watch-
ed all their motions, determined to assert their right
to the island; and at mid-day on Sunday the 3d of
June, while some of the colonists were asleep, and others
hunting and fishing, they made their attack. They
fired a volley into the hut which contained the arms
of the colony. Those that were within, being rescued
from their sleep, rushed out, and were immediately
shot. The rest, unprepared and unarmed, upon hear-
ing the firing, hid themselves among the rocks, or at-
ttempted to gain the beach; by which means the great-
est number escaped, while others were intercepted
and taken prisoners. The English in this melancholy affair
had five men and one woman killed, four men wounded,
and four women and three children taken prisoners; and
the savages retired with a rich booty of sixty stand
of arms, and a quantity of ammunition, besides kit-
chen utensils, wearing apparel, and other European
articles. Consternation and desolation succeeded, and
the confidence of the colonists was now converted in
to the most groundless fears. No attempt was made
to recover what they had lost; and after landing a
party of armed men (under a discharge of cannon
from the ship) to bring off their water-casks, the Cal-
ypso, early the following morning, got under weigh
for Bissao, where she was joined by the Hankey and
Beggar's Benison. Disappointed and dissatisfied
with their situation, mutual irritation and reproaches
broke out between the colonists and the members of
the council. Each attributed their misfortunes to the
other; for while the council was charged with a
want of attention to the comfort and interest of the
colony, they reproached the colonists with licentious-
ness and disobedience. These complaints, and the
fever which appeared in the Calypso, and had been
communicated to the Hankey, reduced the majority
of the colonists to despondency. Ashamed, how-
ever, of relinquishing their design without another at-
tempt, they returned to Bulama, and having redeemed
their captives, they purchased the island from the
kings of Carinabol for the value of 473 bars in goods.
But no sooner was this transaction concluded, than,
instead of availing themselves of the right which they
had now acquired, the majority of the council deter-
mined to abandon the enterprise as at present imprac-
ticable; which determination was communicated to
the colonists in the following resolution: "That see-
ing that the rainy season has already commenced,
and it appearing, from every information we can col-
lect, that we cannot land because of the rains and
fogs at least for four months, and that with every
precaution there will probably be a considerable mor-
tality among the settlers during that time, and con-
sidering withal, that a great proportion of the ad-
venturers in each ship are solicitous to return to Eu-
rope, it is the opinion of the council, that the two
ships and the sloop should be removed to Sierra
Leone to water, and there the expediency of pro-
cceeding to England, or of returning hither after the
rains, shall be taken into consideration." Against
this resolution Captain Beaver entered his protest:
and declared to the council, that he was determined
to remain on the island, with his servant, though ev-
evy one else should leave it: and in this determination
he was joined by one of the council, and between 60
and 90 of the colonists. It was then agreed that
the Hankey and Beggar's Benison should remain at
Bulama, and that the Calypso should immediately
proceed to Sierra Leone, with those who were desir-
ous of returning to England. The settlers were
thus reduced to a third of their original number, and
when mastered by Captain Beaver, who was unani-
mously chosen their president, were found to consist
of 48 men, 19 women, and 25 children. Having
adopted proper regulations for maintaining subordi-
nation, sobriety, and discipline in the colony, and hav-
ing established a friendly communication between
Bulama and the Portuguese settlement on the island
of Bissao, the first care of the colonists was to pro-
ger this estate by making themselves exempt from the heat of the sun, and the in-
lence of the rains, by covering the ship with a wooden
roof. They then set about clearing and cultivating
a piece of ground for a garden, and built a block-
house, which was to serve as a habitation, a general
magazine, and a citadel. Both tropical and Euro-
pean plants and seeds succeeded beyond their expect-
tations; and all vegetable productions arrived at ma-
aturity with astonishing quickness. Several free ne-
groes had been hired to assist in the work. They
were well treated, and always allowed to leave the
island, whenever dissatisfied either with their masters
or their employment; and during the residence of
the English at Bulama, 196 of these Africans had
been employed on the island. Many of the sur-
rounding tribes also visited the colony, who always
came with a view to trade, and brought with them some-
ting to dispose of. But in all their dealings with
these negroes, the colonists observed the strictest in-
tegrity, never shewing the least desire of over-reach-
ing them in the exchange of their commodities. By
these means, and by rigorously adhering to their de-
termination of never being concerned in the purchase
of slaves, they soon gained the good-will and confi-
dence of the natives, without which they never could
have kept possession of the island. Sickness and dis-
affection, however, had spread among the settlers, and
their numbers were daily diminished by desertion or
death. To such a state were they sometimes reduced,
that there was scarcely an European fit for work, or
to give directions to the negroes; and out of the 86
which stood in the island after the sailing of the Cal-
ypso, within nine months ten only were left. These
were at last reduced to nine, who became so dispir-
ited and overcame with sickness, that the whole affairs
and business of the colony rested with Captain Bea-
ver himself. Whatever the energy and perseverance
of one man could do was done by this officer. He
encouraged his countrymen by exertion by his ex-
ample; supplied their wants, and soothed them in their
sickness. He often cheered them with the hope of
succours from England; but all would not do. Fear
and despondency had taken possession of their minds.
They saw only certain death if they remained; and

† L. 78, 16s. 8d. sterling.
BULGARIA, LITTLE, formerly a small kingdom, now a province of the Turkish empire, is bound-
ed on the west by Servia, from which it extends along the banks of the Danube, which is its northern boundary, to the Black Sea on the east; and is separated from Macedonia and Romania by Mount Haemus on the south. It is about 72 German miles in length, and 20 in breadth, except towards the east, where it stretches along the Black Sea nearly 40 miles. This province constitutes the eastern part of ancient Mysia; and received its present name from the Bulgarians, who settled here about the end of the seventh century. These barbarians, allured by the Roman wealth, left their native seats on the banks of the Volga, and ravaging with ruthless fury the countries through which they passed, broke into Thrace, and filled the whole empire with consternation. Notwithstanding repeated checks and defeats from the Roman generals, they still continued their annual irruptions, carrying off immense booty from the plundered provinces; and, near the close of the reign of Justinian (A. D. 560), Zabergan their chief, with seven thousand horse, passed the Danube, and pitched his tents at the distance of 20 miles from Constantinople. The forces of the empire were employed on the distant frontiers; crowds of clamorous rustics surrounded the city, imploring food and protection; and Justinian trembled for the safety of his capital. But the arm of Belisarius was raised for the last time in its defence. At the head of 900 veterans, and a tumultuary band of citizens and peasants, Belisarius advanced against the enemy. The shouts of the multitude dispirited the barbarians; and the desperate assault of the aged general and his guards threw them into confusion. The Bulgarians were routed; and, after extorting heavy ransoms for their prisoners, and wasting the summer in the plains of Thrace, they were compelled to repass the Danube. Not discouraged by their frequent defeats, they repeated their devastations, and looked upon themselves as amply compensated for any loss they might sustain in battle, by the plunder which they collected in their march. In the reign of Constantine Pogonatus, a more numerous horde entered the Roman territories, and ravaged at pleasure the northern provinces of the empire. The forces of the emperor were unable to oppose them; and Constantin at last consented to a dishonourable peace, and agreed to pay an annual tribute to his invader, upon condition that they should discontinue their inroads, and assist him against all his enemies. It was about this time that they settled in lower Mysia, and established the kingdom of Bulgaria—some say with the consent of Constantine, while others allege that they had formed a settlement in that province several years before the commencement of his reign. But his successor, Justinian II., refusing to acquiesce in the stipulated treaty, withdrew the promised tribute, and, invading their country, reduced them to great distress. The triumph of Justinian, however, was but of short duration. His army was unexpectedly attacked by the Bulgarians, who gained a complete victory, interrupted by short intervals of precarious peace, was waged between the Romans and these restless intruders, until the beginning of the 10th century,
when the Bulgarians had added to their dominions, by war or treaty, the provinces of Dardania, Tes-
saly, and the two Epirus's; and the obscure town of
Lychnidus had been converted into the capital of the
Bulgarian king. Their manners had been softened
by their intercourse with the Greeks, and the intro-
duction of the Christian religion; and Simeon, the
heir of the throne, was educated in the schools and
in the religion of Constantinople. Under his go-

government, Bulgaria began to assume a name among
civilized nations; and his genius and valour rendered
her the terror of the neighbouring kingdoms. The
Romans had been dispirited by repeated defeats;
Adrianople was in his power; and preparations were
making for the siege of the capital. But the pro-
gress of Simeon was arrested, by a demand for a per-
sonal conference with the Emperor Romanus. The
Bulgarian dictated the conditions of peace; and the
reconciliation was sealed by a domestic alliance. This
friendship, however, was soon disturbed by the death of Simeon, with whom also died the glory and in-
dependence of Bulgaria. His feeble successors were
consumed by dissension, and presented their country
an easy prey to the first invaders.

The Russians, who had also been incited to foreign
conquest by the fertile regions of the south, landed
an army of 60,000 men on the shores of the Danube,
and entering Bulgaria, ravaged the country with fire
and sword. In a desperate encounter, the Bulgarian
horse yielded to the swords of the Russians with the
loss of their king and the captivity of his children.
Swatoslaus, the Russian chief, now advanced to the
south. He invested the city of Adrianople in spite
of the remonstrances of the Roman emperor, and even
threatened the capital itself. But his numbers were
unable to withstand the attack of 12,000 Romans,
under the command of the valiant Zimisces. Mar-
cianopolis was taken by storm, and 8500 Russians
put to the sword. The sons of the Bulgarian king
were rescued from prison, and invested with the dia-
adem of their father; and Swatoslaus was compelled
to take refuge in the strong fortress of Dristra, on
the banks of the Danube, and at last allowed to escape
only by the generosity of his conqueror. The Bul-
garians immediately submitted to their deliverer.
But their submission ended with his life in 975, when
they shook off the Roman yoke, and renewed their
former devastations in the empire. After a long and
doubtful struggle, the Emperor Basil at last prevail-
ed, and was honoured with the surname of the Slayer
of the Bulgarians. His avarice was gratified by ten
thousand pounds weight of gold, which he found in
the palace of Lychnidus; and his vengeance was sa-
titated, by depriving 15,000 captives of their sight,
except one of each hundred, to whom he left a sin-
gle eye, that they might conduct their blind centu-
y to the presence of their sovereign. This terrible
element awed the nation to obedience; and their
king is said to have died of horror and grief, at the
sight of his wretched subjects. Dispirited, and cir-
cumscribed within a narrow province, they contin-
ued for nearly two centuries the patient subjects of
the Roman emperor; and, on account of their power-
ful assistance against the Turks and Latins, they
were allowed to choose a king of their own nation,
who acknowledged himself a vassal of the empire.
The Eastern empire, however, was fast hastening to
decay. Its schism with the Latin church, and the
profligacy and rapacity of its princes, presented a fa-
vourable opportunity for throwing off their subjec-
tion. The Bulgarians had been exasperated by the
plunder of their flocks and herds, which had been
carried off to supply the luxuries of the royal table,
and by the denial of equal rank and pay in the mil-
tary service. Their former injuries had long been re-
membered in silence, and were aggravated by the
present insults; but the arms and policy of their
sovereign Calo-John delivered them from oppression,
and firmly established the independence of the king-
dom. He renounced all submission to the religion,

as well as to the laws of Constantinople, and, dispatch-
ing an embassy to Pope Innocent III., acknowledged
himself a disciple of the Latin church; and received
from the Vatican a royal title, a Latin archbishop,
a holy banner, and the licence of coin ing money.—
His enmity to the Greeks, however, was soon turn-
ed into compassion and alliance. Upon the subver-
sion of that monarchy by the Latins in 1204, and
the accession of Baldwin, Count of Flanders, to the
empire of the East, Calo-John, as a votary of the
Pope, claimed the honour of being a friend and asso-
ciate; but his ambassadors were dismissed with a
haughty message, that their rebel sovereign must de-
serve a pardon, by bowing before the footstool of
the imperial throne. The Bulgarian suppressed for a
while his resentment, but cherished the insult. He
inflamed the discontent of the Greeks, and promised
them his friendship and support. He joined to his
own forces a body of 14,000 Tartars, which he had
drawn from the Scythian wilderness; and when the
flower of the emperor's army was transported beyond
the Hellespont, the signal was given for the general
massacre of the Latins. Adrianople was taken. Bal-
dwin, who had come to besiege the rebels, was defeat-
ed, and taken prisoner; and the remainder of his
troops were saved from destruction, by a masterly
retreat, of three days, to the shores of the Propontis.
The success of the Bulgarians continued till the juris-
diction of the Latins was confined to the capital and
a few adjacent fortresses; but his career of victory
was stopped at the siege of Thessalonica, where he
fell a victim to domestic treason, being stabbed du-
dring the night in his tent. His successor was unable
to prosecute his schemes of ambition and revenge;
and, after several defeats, the Bulgarian king was
compelled to conclude an honourable peace with the
successor of Baldwin. The independence of Bulga-
ria, however, was not of long continuance. In 1275,
Stephen IV., king of Hungary, having vanquished
and cut to pieces the army of the Bulgarians, com-
pelled them to acknowledge him as their sovereign.
But revolting from the Hungarians, and joining with
the emperor of Constantinople against the Turks,
they were totally defeated by Amurath I., whose
successor, Bajazet, completed the conquest of the
whole country in 1396, and reduced it to a province
of the Turkish empire, in which state it has ever
since remained. See Turkey.

Bulgaria is divided by the Turks into four San-
gjakships, viz. Widin, Sardice, Nicopoli, and Silistria,
BULGARIA.

with each a capital of the same name, except Sar-
dice, which is now called Sophia. The other prin-
cipal cities are Cistow, Rousdijkou, Orsows, Bab-
dag, Tontcha, Rasgrad, Bazardjik, Choumla, Ter-
ova, Varna, Lovatz. &c. This province is in ge-
eral mountainous, but the plains and valleys, which
are watered by the Danube and numerous tributary
streams, are rich and fertile. Even in the mountains,
nature has spread many of her richest gifts. The for-
rests of Mount Hæsus abound in a variety of fruit
trees, particularly cherries, apricots, and vines; and
in its deep glens and uninhabited recesses, aromatic
shrubs and the gayest flowers are as numerous and
exquisite, as in the most cultivated gardens in our
less genial soil.

The chief productions of Bulgaria are grain of all
kinds, cattle, especially horses, wool, iron, and wine,
which form a very extensive and lucrative commerce;
and the navigation of the Danube, which is per-
formed by small boats, affords it an easy communica-
tion with the neighbouring provinces, and the ports
on the Black Sea; but as the commerce of this pro-
vince, especially its imports, will be more particu-
larly considered in the account of its principal cities,
we shall confine ourselves in this article to a general
description of its productions and exports. The ex-
portation of corn out of the kingdom is rigorously
prohibited, so that the capital is its principal mar-
et; and from the immense quantities which are an-
ually carried down the Danube, this river is called
by the Turks, the Foster-father of Constantinople.
Wheat, in common, sells for 36 paras the quilot,
which, in the southern districts of Bulgaria, weighs
48 okas; but, in the northern parts, the quilot
weighs 120 okas, and costs there only 60 paras.
Rice, barley, and millet, sells for from 45 to 50 pa-

ras, and sesame from 65 to 70. The greatest quan-
tity of rice grows in the territory of Philippopoli.
It is a farm of the Grand Signior's, and the rice is
given away chiefly in the payment of pensions, which
are specified by a certain number of quilots per day.
The wool that is gathered in Bulgaria is of a very ex-
cellent quality, particularly that of Nicopolis, which
sells for from 8 to 10 paras the oka; and which, by
proper management, might be made even to equal
the wool of Spain. What is produced in the sou-
thern part of the province, passes to Constantinople;
but that of the north is spread over Germany and
the ports of the Adriatic. Its silk is also very abun-
dant, and constitutes an important article of com-
merce with the capital. The silk of the best qua-
lity, which comes from Zagara, Tchiprou, and Ki-
zanlik, is nearly ten piastres the oka, while the silk of
Haskeni sells for eight. The Bulgarians owe the in-
crease of this article entirely to the inhabitants of
Brousse in France, who have come to settle in the
country, and who have planted a prodigious quan-
tity of mulberry trees. The honey of this province is
superior in quality to that of Wallachia or Moldavia.
The best comes from the neighbourhood of Yamo-
li, which sells for about eight paras the oka; but its
exportation is prohibited, except to Constantinople;
and though very abundant, it is with great difficulty
that it can be smuggled into any of the ports on the
Black Sea. Wax is sold here pure and un adulter-
ted. It is yellow, and of an excellent quality, and is
gathered in great quantities at Ternova, Yamboli,
Nieboli, Cistow, Rousdijkou, Toutrakia. Silistria,
Prevat, Bazardjik, Zagara, Tchiprou, Choumla, and
Rasgrad. The tobacco of this province varies great-
ly in quality. The best, which comes from Yenidjé,
sells from 12 paras to as high as a piastre the oka;
that of Kourmarlu, from eight to ten paras; and
that of Kirdjali, a little cheaper. The fourth qua-
lity, which is called Kisdil deli, is a very strong to-
acco, which is exported to Egypt and Arabia, and
sells at eight or nine paras the oka. The wine of
Bulgaria is rather of an inferior quality. It is, how-
ever, made in considerable quantities; and between
five and six thousand waggon loads are yearly car-
rried to Russia and Poland, which commonly costs
about 50 paras the quintal. The immense quantities
of tallow, which are collected in this country, is con-
traband every where throughout the kingdom, ex-
cept at Constantinople, Adrianople, and Rodosto;
and butter, which is made in great plenty on the
shores of the Danube, is horded up entirely for the
use of the capital. Bulgaria carries on a consid-
erable trade in hides. Those of the buffalo weigh from
18 to 70 okas, and sell at from 2 to 13 piastres; and
the price of ox-hides, which weigh from 12 to 25
okas, is from 1½ to 3½ piastres. It has also consi-
derable manufactures of Morocco leather, and sheep
skins of all colours, particularly at Rousdijkou, on
the Danube. Its horses, particularly those of Do-
brogê, are very much esteemed. They are small and
strong, like the Tartar horses, but much better sha-
pered. Iron is a principal article of commerce in this
province. The mines of Samakow and Keustendi-
ùl are very extensive, and supply Constantinople and all
the districts on the Black Sea. These mines are
farmed by the Grand Signior, and the metal sells up-
on the spot for from 4½ to 5 piastres the quintal.
Its wrought iron is also greatly sought after, parti-
cularly the pistol and musket barrels of Selimna,
which are equal to those of Constantinople; and the
prodigious quantities of horse-shoes and nails which
are made at Sophia, are scattered over the whole Ot-
toman empire. Saltpetre, of a very good quality, is
gathered at Philippopoli, Bazardjik, and Yamboli.
A new branch of commerce has lately been formed
in Bulgaria, consisting of hare skins, of which great
quantities are exported from Adrianople to France;
and such is the demand for this article, that at Mar-
seilles it brings from 4 to 5 livres per pound. But
if the demand continues, the quantity must soon be
diminished; for the Bulgarian peasants, who find
hare-hunting such a lucrative concern, will not stop
until they have considerably lessened their numbers,
perhaps destroyed the species.

The commerce of Bulgaria was long in the hands of
the Ragusians, who had large establishments at
Rousdijkou, and Sophia, and several other places.
These establishments, however, have almost entire-
ly disappeared; and the few Ragusian houses that
remain, seem to have very little trade. They were
succeeded by the French, who, within these last
thirty years, had extended their merchandise over
BULGARIA, the whole province. Four or five French houses established at Adrianople, received direct from Marseille the manufactures of France, for which they returned the productions of Bulgaria by the ports of Enos and Rodosto. This trade, however, has suffered greatly by the present war; and the communication with France by sea has been almost entirely destroyed.

The inhabitants of this province, who were formerly distinguished for their military achievements, are now dispirited by oppression, and sunk in ignorance, idleness, and filth. Its political state is now that of the worst state of the feudal system; its numerous lords hold their estates from the pacha or governor, and they are bound to bring so many armed men into the field, whenever summoned by their chief.

Agriculture is here very imperfect; and this country is indebted for its excellent productions, more to the fertility of the soil, than the exertions of its inhabitants. Their towns, in general, cover a great extent of ground, and consist of miserable cottages, each surrounded with a large garden; and their streets exhibit nothing but desolation and dirtiness. The Bulgarian ladies are extremely fond of ornaments, particularly of small pieces of coin, which some wear strung together like fish-scales, and plated upon shreds of gold thread, tied in bunches; and others interlace them with their braids of hair. According to the account of an intelligent traveller who lately visited that country, "they have many of gold; and it is asserted, the more rare of the imperial or ancient Greek coins have been frequently discovered by travellers so applied, and as having been transmitted from the remotest generations. They wear them, too, sewn on ribbands appendant to their head-dress, and hanging down to their heels. They cherish, as a very favourite ornament, broad clasps of silver gilt, fastened about two thirds round each arm, as bracelets. So religiously are their coins preserved, that no rank of life is scarcely so mean as to be deprived of them; and it is not uncommon to see even children, naked and hungry, decorated with these pieces of money, the value of which would clothe and feed them for a year." The mountains are the retreats of numerous banditti, who infest the whole country, and seize all they can meet with as plunder; and such is the perpetual alarm which they excite, that the shepherd and husbandman seldom venture into the field without a pistol and dagger at their girdle. The Bulgarians are mostly Christians of the Greek church, but they are, ignorant and superstitious. They have one patriarch and three archbishops, subject to the patriarch of Constantinople. In the hills south of Sophia, are the ruins of an ancient gate, consisting of two stone pillars, with an arch over them, which is said to have been constructed by the Emperor Trajan, in commemoration of his having marched his army along a road formed by himself through steep rocks and precipices, before impervious; and throughout the whole of the country, sepulchral tumuli are to be seen, which mark the slaughter of the inhabitants, and the progress of the Turkish victories. See Peuchet Dictionnaire, &c.; An Itinerary from London to Constantinople, p. 60, in Phillips's Coll. of Voyages, &c. vol. i.; Gibbon's Roman Empire, vol. vii. ix. x. xi.; and Anc. Un. Hist. vol. xix. (p)

BULGARIA, GREEK, or the duchy of Bulgaria, a province of Asia, in Russian Tartary, now incorporated with the Russian empire, and forming a part of the government of Caucasus. It is bounded by the kingdom of Cassan on the north; by Bas-kiria on the east; by the river Samara on the south, which separates it from the kingdom of Astrakan; and is terminated by the Volga on the west. This province is of little extent; it is not known. It takes its name from the capital Bulgaria, which is situated near the Volga, and is merely the remains of the ancient city of Bri-cochinow, and now consists of only about 100 houses, inhabited by peasants. Numerous rivers intersect the country, and lose themselves in the Volga; and the mountains furnish precious stones, iron, and crystal. See Peuchet Dictionnaire, &c. (p)

BULL, GEORGE, Bishop of St David's, was born at Wells, in Somersetshire, in the year 1634. At the age of four, he was left, by the death of his father, in independent circumstances. Having been early destined for the church, he received a liberal and appropriate education; and such was his progress in classical learning, that he became fit for the university at the age of fourteen. He was sent to Exeter College, in Oxford. There he spent the greater part of his time in pleasure and amusement; but contrived, notwithstanding, to acquire intellectual reputation and respectable patronage among his superiors. In consequence of refusing to take the oath of allegiance to the Commonwealth, he was obliged to leave the university, about seven months after he entered it. He retired to North Cadbury, where he continued for four or five years; during which time, one of his sisters had the merit of wearing him from the vanities to which he had been addicted, and inducing him to prosecute the studies that were peculiar to his views in life. At the age of twenty-one, he was ordained deacon and priest by Dr Skinner, the ejected bishop of Oxford; and soon after became minister of St George's, near Bristol. In that situation he discharged his pastoral duties with singular assiduity and zeal, preaching twice every Sunday, visiting his parishioners from house to house, and labouring by all the means in his power to instruct and reform them. In the livings which he afterwards held, he was characterised by the same exemplary attention to the improvement and interests of his people; and was so much respected and beloved by them, that he prevailed on many to return to the bosom of the church, which at that troublous period was an object of general and inveterate dislike. While rector of Sud-dington St Mary, in Gloucestershire, which he held for twenty-seven years, he was extremely diligent in theological study, and composed the greatest proportion of his works. In 1669, he published his celebrated book, entitled, Harmonia Apostolica. The object of this treatise is, 1. To explain and defend St James's doctrine of justification by works; and, 2. To demonstrate the agreement of St Paul with St James. It is frequently referred to by Arminian and Pelagian writers, in support of their notions respecting the mode of our acceptance with God, and is perhaps as good as any thing on that view of the
subject which has yet been produced. Towards the
day of the year 1675, he published two defences
of his *Harmonia*; one of them, his *Examen Censuræ*,
in reply to Mr. Carter; and the other, *Apologia
pro Harmonia*, in reply to Dr. Tully. All these
works, whatever may be thought of their principles,
are certainly distinguished both by learning and abili-
ty. In 1678, Mr Bull was installed as a prebendary
in the church of Gloucester, to which he had
been promoted by Lord Chancellor the Earl of Nott-
ingham. Two years after this, he completed and
published his *Defensio Fidei Nicene*: a work di-
rected against the Arians and Socinians on the one
hand, and the Sabelhans and Trithesists on the other.
It procured for the author great celebrity as a con-
troversialist, both at home and abroad; and has been
of considerable service in the disputes respecting the
Trinity, which have so long agitated the Christian
church. At the same time, while it has been ap-
plauded by some as a master-piece of reasoning and
erudition, it has been condemned by others as con-
taining no small portion of malevolence, fraud, igno-
rance, and sophistry. The author was presented,
in 1685, to the rectory of Avening, and very soon
after to the archdeaconry of Landaff; and, in consid-
eration of his eminent services to the church, the
University of Oxford unanimously made him a doc-
tor in divinity, although he had not previously ta-
taken any academical degree. As he had been zeal-
ous in the defence and restoration of the establish-
ment, in opposition to its levelling enemies, so he la-
boured to guard it against the other extreme of po-
pish superstition, with which it was threatened
during the short and inglorious reign of James II.—
preaching against that system in the warmest man-
ner; and attacking, with equal courage and ability,
those false and pernicious dogmas, by which it di-
rectly tends to degrade the human understanding,
and to corrupt the human character. Some time af-
after the Revolution, he was put into the commission
of the peace. In this secular office he remained al-
most constantly till he became a bishop. During all
the time that he held it, he was indefatigable in his
endeavours to put down profaneness and immorali-
ty, by executing the laws of the land with prudence
and vigour. While rector of Avening, he published
his *Judicium Ecclesie Catholicae*, &c. It was in-
tended to be a supplement to the *Defensio Fidei Ni-
cene*, and to vindicate the *Anathema*, as the other
work vindicated the *Faith*, which had been decreed
by the council of Nice. For this publication he re-
ceived the thanks and congratulations of the whole
clergy of France, communicated in a letter from the
Bishop of Meaux. The last treatise which Dr Bull
wrote, was his *Prætiosa et Apostolica Traditio*, &c.
the great object of which was to shew, in opposi-
tion to Dr. Zwickler and his apostles, that Christ's
existence before the creation of the world was an
apostolical tradition, introduced into the first Chris-
tian churches, and not a doctrine that was afterwards
broached by heretics, or borrowed from the heathen
theology. In the seventy-first year of his age he
was nominated to the bishopric of St David's, which,
however, he accepted of with considerable reluctance
and hesitation, on account of his advanced period of
life, and indifferent state of health. He was present
in the House of Lords when the bull passed for the
union of the two kingdoms; and, on that occasion,
delivered a short speech, in succeeding a motion
which had been made, to give a character of the Church
of England, as the Scottish parliament had given of
their church. As a bishop, he conducted himself
with becoming zeal, and discharged the episcopal
functions with all the care and attention he could
bestow. He was particularly strict in examining the
qualifications of candidates for the ministry. He
shewed great anxiety to promote education among
the poor, by the erection of charity schools. He
laboured to establish and to encourage family-devo-
tion, and family-libraries, consisting of books on
practical divinity. And, while he endeavoured to
revive the spirit and the practice of ancient disci-
pline, he also addressed himself to the civil power,
for the exercise of its legal and coercive authority
against impiety and vice. His intense application
for study had impaired his health and constitution;
and he had not enjoyed his bishopric above four
years, when he was carried off (1710) by a severe
distemper, leaving behind him an acknowledged re-
putation for sound talents, great learning, fervent
piety, unblemished integrity, and warm active bene-
volence. Several years before his death, his Latin
works were collected and printed in one volume folio,
under the inspection of Dr Grabe; the author him-
self being prevented by infirmity from managing the
publication. After his death, several productions from
the bishop's pen were given to the public. Of these
posthumous works, his Sermons are of the greatest
value. They contain much curious matter, and much
ingenious discussion, and deserve a careful though
cautious perusal from every student of theology.
The whole works of Bishop Bull have been publish-
et together in folio, by his biographer Mr Nelson.
See Nelson's *Life of Dr G. Bull*; and *Biographia
Britannica*. (7)

BULL, from bulla, a seal, is a decree issued by
the pope, which is used both in affairs of justice and of
grace, and answers to the edicts of secular princes.
It is written on parchment, in an old Gothic letter,
and has a leaden seal attached to it, which presents,
on one side, the figures of Peter and Paul, with a
cross in the centre, and on the reverse the name of
the pope, with the year of his pontificate. If the
bull be a letter of grace, the seal is suspended by
silken threads; but if it be a letter of justice, the
seal is hung by a hempen cord. According to the
laws of the Romish church, no beneﬁces under twen-
ty-four ducats per annum can be granted, and no ju-
bilee celebrated, without a papal bull. The bull in
*crema Domini*, which is read every year in the pope's
presence on Maundy Thursday, contains violent exe-
crations against heretics, and all who shall disturb
the peace of the church; and the thunder of its anath-
emas is represented by the pontiff throwing a burning
torch upon the ground. Upon the death of a pope
his name is immediately erased from the seal, when
it is wrapped up in linen cloth, sealed with the
seal of the vice-chancellor, and delivered to the
Bull-fights.

Bull-fights, a species of entertainment to which the Spaniards are passionately addicted, and which may be termed the national spectacle in Spain, as the combats of gladiators were in Rome, and as horse-racing is in England.

The Spaniards seem to have borrowed this amusement from the Moors, by whom it was probably adopted as a substitute for the entertainments of the Roman amphitheatre. We have no reason, indeed, to believe that the Romans ever introduced bulls on the arena, previous to the bull-fight which Mura- tori has described as exhibited in the Colosseum, in 1332, after the fashion of the Moors and Spaniards. But the source of that pleasure, which the Roman and Spanish amphitheatres afforded, was exactly the same; in both, the strength and fury of formidable animals was opposed by the address and courage of human combatants; and the Moors, who had not the same facilities as the Romans for procuring tygers and lions, found a natural and nearly adequate compensation in the ferocity and spirit of the bull.

Whether or not the Romans ever amused themselves with bull-fighting, we are certain that it was not unknown to the Greeks. Festivals, called ταυροπαγιβολο- για, or days of bull combating, were held by the Thessalians in particular, at least three hundred years before the Christian era. The city of Larissa was much celebrated for these fights, in which its inhabitants were the most skilful combatants. Among the Greeks, however, these entertainments differed considerably from the bull-feasts of the Spaniards. Several bulls being turned out at once, an equal number of horsemen encountered them with a particular kind of spear. Each horseman opposed himself to one bull, and riding by his side, pressed and avoided him by turns. This parrying was continued till the strength of the animal was exhausted, when his antagonist seized him by the horns, and, without dismounting, threw him to the ground. Sometimes an expert combatant threw himself upon the bull, while yet foaming with rage, and in spite of all the efforts of the animal to dismount him, struck him to the ground amidst the tumultuous plaudits of a vast concourse of spectators.

The bull-fights are conducted in Spain with great pomp and magnificence. In the principal towns, there are large amphitheatres appropriated to these barbarous exhibitions. The amphitheatre of Madrid is three hundred and thirty feet in diameter; the arena two hundred and twenty-five, and it is said to contain fifteen thousand spectators. In some towns where there is no regular amphitheatre, the principal square was converted into a temporary one for the purpose; and the balconies of the different stories were continued across the ends of the streets which terminated in the square.

The exhibition commenced with a procession round the arena or square, in which the champions, who were to attack the bull either on foot or horseback, first made their appearance; and after these came two alguazils on horseback, dressed in wigs and black robes. They advance with solemn step towards the president of the feast, to receive his order to begin. The signal being given, two folding doors fly open, and the bull rushes furiously into the arena; but startled at the sight of the multitude, and stunned by their shouts of joy, he pauses, and looks round as if to single out some proper object for his rage. A picadore, dressed in the old Spanish garb, advances towards him, mounted on horseback, and armed with a long and heavy lance. The two antagonists, as they approach, survey each other with fixed attention, alternately stop and advance, hesitating apparently which of them should begin the attack; till the bull, roused to the highest pitch of fury, stoops with his head, shuts his eyes, and rushes with impetuosity on his adversary. His courage is applauded with renewed clamours of joy; which, while they inflame him with fiercer rage, excite a kind of emulation in the breast of his antagonist. The picadore, fixing himself firmly in his seat, and holding his lance under his right arm, plunges it into the neck of the furious animal, and thus endeavours to push him aside. Maddened with the pain, the bull now wreaks his vengeance on the innocent and defenceless horse which bears his enemy, and generally overthrows both him and his rider. This is the most animated, but to a stranger the most disgusting part of the combat. The patience and spirit of the horses, though truly astonishing, are of little avail against the armed fury of the bull. Sometimes the two animals rear themselves together on their hind legs, pushing against each other, the lance of the picadore being fixed all the time in the bull's neck: but as the superior weight of this animal always prevails, the horse has no safety but in flight, nor can he often escape theswiftness of his pursuer. The same bull not unfrequently goes seven or eight horses, which present, before they die, a spectacle, no less wonderful, than it is shocking. With their entrails hanging to the ground from their lacerated sides, they still obey the hand of their rider, directing them towards the bull, from which they have received their mortal wound.

When the picadore, dismayed by his furious antagonist, is in danger of being torn to pieces, the chulos, or foot combatants, instantly spring to his rescue, and provoking the animal by shaking before him little banners, or cloaks, of different colours, allow the horseman time to retire. But in saving their
Bull-fights.

BULL-FIGHTS.

They expose themselves to equal peril; the bull pursues them with amazing impetuosity; and if they cannot deceive him by dropping the banner which they hold in their hand, their only recourse is to leap over the barrier which forms the interior of the circle; and which, though six feet high, is sometimes cleared at the same moment by the torreador and his adversary. As soon as the picador has recovered himself, and has mounted a fresh horse, he again presents himself before the bull, and the combat is renewed in the same manner as before; or if he has been disabled by his wounds, he is succeeded by another champion, who, approaching with caution, and dextrously avoiding the animal's thrusts, waits an opportunity of striking an effectual wound.

At length, when the poor animal begins to stagger through loss of blood, and its rage increases as its strength is diminished, a signal is given for the horsemen to retire, and he is resigned to the banderilleros, or foot-combatants, who torment him with a more refined species of cruelty. The office of these banderilleros seems to require much greater address than that of the horseman. They are active young men, generally eight in number, each armed with a bundle of banderillas, or little arrows, barbed like a fish hook, and ornamented with streamers of stained paper. These they fix in the neck of the bull, never attacking him, however, from behind, but meeting him in front. By the pain which the arrows inflict, his fury is redoubled; the amphitheatre is shaken by his roaring; and his torture is rendered more acute by his vain efforts to dislodge the weapons which gall him. A fine opportunity is now afforded to his antagonists for displaying their activity and address. When he has singled out one object of vengeance, and is preparing to pierce him with his horns, at the very moment when he pauses and shuts his eyes, his opponent fixes his banderillas and escapes. If he hesitates, and seems afraid to make the attack, they present their mojoles, or little banner, which they always carry in their left hand, and provoking him to push at that, pass by him in security. He frequently, however, turns quick upon his assailants, and then their only safety is in flight. To amuse him, they let fall their mojoles, on which he sometimes spends his fury, trampling it under his feet; but as frequently he keeps his eye fixed on the man who dropt it, and pursues him with such velocity, that he has scarcely time to leap over the fence before he is overtaken by his irritated pursuer, whose wrath, on these occasions, is deadly.

When he has endured these varied torments, till he is almost exhausted, the president gives the signal for his death, which is announced by the sound of drums and trumpets. This is by far the most interesting part of the scene, and affords a subject which an able painter might not disdain to delineate. The matador appears alone in the circle, holding in one hand a long two-edged sword, in the other a kind of flag, which he waves before his adversary. The animal sometimes remains immovable, pawing the ground, lashing his tail, and seeming to meditate vengeance. His antagonist advances towards him with extreme caution, carefully studying his character, and watching all his motions. A kind of awful suspense prevails throughout the assembly, and anxiety is paint-
Bull-fights, ings then resound throughout the theatre; and the unhappy animal, regarded as a common enemy, is loaded with blows and excretaions by all within whose reach he passes. If all their teasing cannot provoke him to rage, there is a general cry of los perros, los perros, "the dogs, the dogs." Large bull-dogs, even fiercer than those of England, are then let loose upon him; and seizing him by the neck, the ears, or the nostrils, pin him to the ground, till the matador kills him by striking a small dagger into his spine.

The expence of these bull-fights is enormous, but is well compensated by the profits which they return. From documents of the first authority, Mr. Townshend has calculated the daily expence of these savage exhibitions at 336 sterlings; and the daily receipts which they bring at £700. After deducting the salaries of the different combatants, the balance was bestowed to charitable or pious institutions at Madrid, it formed the principal fund for the support of the general hospital.

The passion of the Spaniards for this horrid amusement was altogether astonishing: Every where, even in the smallest villages, there were places appropriated to the purpose; and when a bull-fight was announced, it excited a more lively joy than would probably have been occasioned by the greatest national benefit. The shop, the work-room, the plough, every domestic and public occupation was deserted for the amphitheatre: people of all ranks and conditions were equally eager for the show, and every countenance was animated with joyful expectation. Even the ladies were not exempted from the general enthusiasm; they discussed the different merits of the picadors, toredores, and matadors, with as much keenness as our ladies would the gracefulness of a dancer, or the talents of a comedian; and feasted with scenes of blood those eyes, which were intended to be exercised only in softer cruelties. The combatants themselves naturally entertained a high idea of the excellency of their art, and could energy be identified with ferocity, perhaps this defence might be so far admitted. Like the combats of gladiators, this amusement probably owes its origin to the warlike spirit of its inventors; and, if the bulls, instead of being encountered by hirelings, were combated by any champion who chose to display his prowess, valour and intrepidity might thus be rendered, through the influence of emulation, the characteristic qualities of the community. But the cool survey of deeds of cruelty, without any sense of personal danger, or any excitement of the active powers, may indeed harden the heart, and repress all the generous feelings of our nature, but can never induce habits of fortitude and resolution; they may render us ferocious, but will never render us brave. The Roman amphitheatres were never frequented with greater enthusiasm, nor were their arenas ever drenched more profusely with blood, than when that degenerate people trembled at the slightest alarm of a foreign enemy, while their savage dispositions were displayed in plots, assassinations, and civil tumults; and, whatever compliments polite travellers have been disposed to pay to the softness and elegance of Spanish manners, it is impossible to forget how much the Spaniards are addicted to the use of the stiletto; it is impossible not to trace, in their enthusiasm for bull-fighting, the same cruel but dastardly temper, which delighted in the tortures of the mild and defenceless natives of America.

Formerly, bull-fights formed part of the entertainments which the court gave at certain times for the amusement of the populace. On these occasions, the king and his family honoured the spectacle with their presence. His military household presided to keep order; his halberdiers formed the inner circle of the theatre, and their long weapons were the only barrier they opposed to the assaults of the bull. A more enlightened policy induced the Spanish government to suppress, a few years ago, this kind of amusement, which was productive only of evil; which suspended the exertions of regular industry, and tended to "destroy the two species of animals most useful to man, the horse and the ox, in a country where the latter is not plentiful, and where the better kinds of the former begin to grow very scarce." See Burgoanne's Present State of Spain, vol. ii. p. 148—164; Trin's Travels in Spain, p. 297—299; Townshend's Journey through Spain, vol. i. p. 342, &c.; and Laborde's View of Spain, vol. v. p. 328. (k)

BULLIALDUS, BOULLAUD, or rather BOULLIUAD. Ismael, a celebrated French astronomer, was born at Loudun, in the department of Vienne, on the 28th September 1605. After having gone through a course of philosophy at Paris, and a course of civil law at Poitiers, he travelled into Holland, Italy, Germany, Poland, and the Levant, and established a correspondence with the most distinguished philosophers of the times. The attention which he had paid to mathematics, civil law, theology, and sacred and profane history, obtained for him the reputation of an universal genius—a title by no means ill applied, when we consider the great variety of subjects upon which he wrote. Although Bullialdus was born and educated in the Protestant faith, he became a Catholic priest in the year 1639, at the age of 27. After an active life, during which he made numerous astronomical observations, he retired to the abbey of St. Victor at Paris, in 1689; and he died there on the 23th November 1694, in the 89th year of his age.

In the year 1638, Bullialdus published at Amsterdam an astronomical dissertation, entitled, Philologiae siue de vero systemate muni. This work was republished in 1645, under the title of Astronomia Philologiae— a work founded on the hypothesis of the earth's motion round the sun. In this valuable work, which obtained a high reputation for its author, Bullialdus shews, that the inequalities of the planets may be represented, by supposing them to move uniformly in an ellipse round one of its foci, and that the calculation of these is very simple, by imagining
BULLIALDUS.

Bullialdus, a circle and an epicycle, in place of the elliptical orbit. Our countryman, Seth Ward, Bishop of Salisbury, published, in 1636, his Astronomia Geometrica, in which he has given a very simple method of calculating the equation of a planet in an elliptical orbit. Hence, the elliptic hypothesis which we owe to Bullialdus, has been called Ward's hypothesis.* Dr Ward supposed, that the motion of each planet is so tempered about the focus in which the sun is not placed, as to form at its angles proportionally to the times; while Bullialdus makes every planet move in an ellipse, formed by the section of a cone, whose axis passes through one of the foci of the ellipse, and makes the motion of the planet about the cone, and in circles parallel to the base of the cone, to be equal. Hence he supposes, what is just the hypothesis of Ward, that the angles at the focus in which the sun is not, are proportional to the times. Dr Ward has pointed this out in his work, entitled, In Ismaelii Bullialdi Astronomia Inquisita, 1653; and has also mentioned several mistakes of our Bishop. These mistakes, Bullialdus has very ingenuously confessed, in his reply to the learned Bishop, entitled Astronomia Philolaiacae fundamenta clarissimae et asservata adversus Zelci Wardi impugnationem; but he has, at the same time, pointed out a very ingenious correction of the elliptic hypothesis. "This correction," says Dr David Gregory, "is well enough, if it be taken only for a correction of the approximation to the true system, as it ought to be; because by it, the coequated anomaly at length might be found from the mean, a priori, and, at the same time, the calculation satisfy ob-

Observation, which no one had done before him (according to Mercator's judgment) in the elliptic hypothesis. But when Bullialdus puts it upon us as the true and genuine system, and derives the physical causes of it, after his manner, from the cone, he not only leaves the foundations of his Philolaiaco astronomicus unexplained, but disputes as if there were no physical foundations of astronomical systems.

In 1638, Bullialdus published a work, entitled De Natura Lucis. In 1641, he published his translation of Theo, the Platonist of Smyrna. His treatise, De Lineis Spiralis Exercitatio Geometrica et Astrononica, appeared at Paris in 1657. In 1663, he published a treatise of Toletan's De judicandi faculitate. In 1666 appeared his Monita duo ad Astronomos; primum de stella Ceti, alterum de Nebulosa in Andromedae. "In 1689, he published his History of Ducas in the original Greek, with a Latin version, and notes. It was printed at the Louvre in 1649. The manuscripts of Bullialdus were preserved in the king's library, and there was also a copy of them in the depot of the Marine. See Perrault's Hommes Illustres, Paris, 1697; Niceron Memoires des Hommes Illustres; and the Journal des Scavans, Feb. 7, 1675. [o]

BULLION.

The question that has of late engaged so large a portion of public solicitude, will lead to a division of this article into two parts of very unequal extent: the first treating literally of Bullion—the second of the Bullion controversy. The latter is entitled to a place in a permanent work, both from its present importance, and from its probable connection with future improvements in the state of our money system. It is justly remarked, that ameliorations of the most obvious character, in general, escape attention until forced on mankind by necessity. The rapid fall in the value of money since 1795, and more particularly within these three or four years, appears to us calculated to rouse the attention of the public to the adoption of a different standard, in the adjustment of contracts of long duration. It is long since Dr Smith told us, that money, as a measure of value, was chiefly useful from year to year; and, in this northern part of the kingdom, we have recently seen, in the case of the clerical stipends, the enactment of an optional reference to the current prices of corn. Much time may elapse before the adoption of a correspondent rule in the other important transactions which call for it—the present season of war and political agitation being highly unfavourable to discussions which demand so much length of deliberation; but it is always one advance towards improvement, to ascertain the origin of past errors. With this view, an enquiry into the causes of the late rise in the price of bullion, may be made the channel of considerable instruction to us.

1. Bullion may be defined, "Gold or silver in an un coined and unwrought state." Though the quality of bullion in our markets is understood to be of the British standard, the word bullion is of general import, and may be applied to gold and silver, with whatever mixture of alloy. It signifies also these metals in their unalloyed or virgin state; though they are, in that case, so soft as to be little fitted to receive any permanent shape; and of course are seldom exposed to sale. Our laws, which prohibit strictly the export of British coin, lay no restraint on the traffic in foreign coin or bullion. After oaths have been made before the magistrates, that the specie in question has not been obtained from the melting of British coin, the export may freely take place. Gold being with us the standard metallic, the word bullion, when used by itself, is understood of gold bullion. The proportions in a pound of gold of the British standard, are 11 oz. 2 dwt. pure metal, and 18 dwt.
Bullion.

The standard weight of our guinea is 5 dwt. 93 grains; but the more ordinary weight, after a coinage has been in use, is 5 dwt. 8 grains. A guinea below 5 dwt. 8 grains is no longer a legal tender, nor is there any penalty in melting and using it for the purposes of manufacture. It cannot, however, be exported. The standard price of gold is L.3, 17s. 10½d. an oz.; the standard price of silver is 5s. 2d. an oz. The relative value of gold to silver is somewhat different in each currency. In ours it is (according to Dr. Kelly) as 15½ to 1; in Paris 15½ to 1, which is very nearly the same; in the United States it is about 15 to 1; in Hamburgh 14.7, and in Amsterdam 14.8 to 1.

Until a century ago, silver was the standard metal in our currency, as it still is in the currencies of Holland and Hamburgh. Since 1717, gold has been our standard. Gold bullion in our markets was, during many years, at a very slight variation from the coinage price, with the exception of an interval previous to the great recoinage in 1773, when the worn and degraded state of our guineas made uncoined gold comparatively high. It rose, however, no higher than L.4, or L.4, 1s. per oz., and fell to its proper level as soon as our coin was renewed. But in silver it has unfortunately happened, during more than a century, that the market price has exceeded the coinage value of 5s. 2d. an oz. Hence a powerful temptation to melt the coin; and hence the cause of the sudden disappearance of the expensive coinage executed in King William's reign.

India and China, which used for ages to receive large supplies of silver from Europe, have of late years drawn them direct from America; one result, among others, of the extended traffic of the United States. It happens indeed, oddly enough, that in consequence of the high price of bullion in England, our mint is now at work on silver imported from Bengal. The partial diminution which has taken place in the present age in the relative value of silver to gold, is to be accounted for by the difference in the quantities respectively produced at the American mines, where gold has hardly kept up its former amount, (Evidence, Bullion Committee, p. 159,) the supply of silver has been nearly doubled. Mexico is in this, as in other respects, by far the foremost of the Spanish colonies, the yearly produce of her silver mines appearing now to amount to nearly five millions sterling. The collective produce of the rest of Spanish America in silver and gold, may be estimated at three millions more. Adding to these somewhat less than a million sterling for the produce of Portuguese America in both metals, and somewhat more than another million for the mines of our own hemisphere, we make a total of ten millions sterling annually, added to the stock of the precious metals throughout the world. When we thus find that the produce of the mines of the old world form a tenth part only of those of the new, we need hardly wonder at the rapid decrease in the value of the precious metals which took place throughout Europe in the sixteenth century, the time when the Spanish American mines began to be effectually wrought. A much greater fall would have ensued, had not the extended commerce to India and China opened, chiefly through the medium of the Dutch, a wide vent for those metallic treasures.

It appears, from tables in the Appendix to the Bullion Report, p. 185, that the relative weight of gold annually produced is to that of silver as one to fifty-two; its relative value as one to three and a half. Spain being the country in Europe which is supposed to feel the effect of depreciation in the first instance, the state of her cura markets becomes an object of consideration. In observing the course of prices in them during the century from 1675 to 1765, we find very little appearance of enhancement; a circumstance which serves to confirm Dr. Smith's opinion, that during that period there was no material rise in the money price of commodities, while, on coming, to a later epoch, from 1765 to 1787, the enhancement that took place in the Spanish corn markets, (Appendix to Bullion Report, p. 183,) will be found to bear a close resemblance to what happened in our own.

II. We now come to the second division of our article, we mean the question that is still pending, in regard to the resumption of cash payments by the Bank of England. We may look back to the history of parliamentary proceedings for ages, without being enabled to find a topic which has excited a larger share of public interest, or more ample contributions of individual exertion, both in and out of parliament; contributions creditable, on the whole, to their authors, though often marked by the erroneous conclusions inseparable from the application of a limited experience to the discussion of a wide and complicated subject.

Among the various inconveniences produced by our eager participation in the war of the French Revolution, one of the most considerable was the overthrow of our exchanges. That this was not immediately perceptible in 1793, must have been owing to the circumstance of our aid consisting not in money but in troops, and to the large proportion of military stores transported from England. Next summer, the commencement of the Prussian subsidy caused a temporary depression of the exchange, which ceased to exist as soon as it became known, that the infidelity of that power to its engagements would lead to a suspension of our remittances. Besides, Holland and all the north of Germany being open to our merchants during 1794, the counteracting power of commerce had full play in affording a corrective to those encroachments which public expences abroad never fail to make in the natural level of exchange. But in 1795, the case became very different. Our troops had been withdrawn, and our contribution to the continental struggle consisted wholly in money. Holland was no longer open to our commerce, and, what was unfortunately of much more consequence, a deficiency in our harvest forced us to make larger importations of corn from the north of Europe. The balance of commercial payments came thus to be added to the balance of political payments, and their conjunct effect was a considerable reduction of the exchange. Of the distressing consequences of this state of things, both to our merchants and to government, those only can judge who knew the pecuniary straits of 1795 and 1796, or who have read, in the reports of our parliamentary committees, the anxious conferences and correspondence between Mr. Pitt and the Bank directors. It was then (November 1795) that the directors declared that gold had risen in the
Bullion.

market eight per cent. above its coinage value, and that Mr Pitt found it necessary to make a promise (which has since been much talked about) of entering into no political engagement likely to affect the state of our circulating medium, without a previous communication to the bank directors. This expression on the part of the minister, which has since been urged as an evidence of the undue influence of the bank, is merely an example of the difficulties in which governments involve themselves, by aiming at exertions beyond their means. Gladly would the bank have been relieved from that connection with government which led to such conferences, but ministers were sanguine in the cause of Austria, and repeated one demand on the bank after another, with all the confidence which marks the feelings of men unacquainted with the practice of business, and the limited resources of commercial establishments. A better harvest in 1796 had delivered us from one source of embarrassment, and was restoring the exchange; but, towards the end of the year, the threatened invasion from France created an alarm which more than counseled this partial relief.

The failure of some country banks having unluckily taken place at this critical period, a run on other country banks, and a drain of gold from the bank of England, was the consequence. It was in vain that the directors resorted to the expedient which, in ordinary times, they had always found to answer—a reduction of the quantity of their notes. The evil was of a new and peculiar kind, and the drain continued to go on. At last, after diminishing their circulation to nearly eight millions and a half; the directors, finding their demand for cash unabated, communicated to ministers the exhausted state of their coffer; and the consequence was, an injunction from the privy council to suspend all further payments in specie. This suspension was first notified to the public on Monday, 27th February, accompanied with an intimation, that "the general concerns of the bank were in the most affluent and prosperous situation, and that the directors meant to continue their usual discounts, paying the amount in bank notes." And here it is important to remark, by what gradual steps innovations, at first temporary, became incorporated into our permanent policy. The suspension of cash payments appears to have been intended at first for a few weeks only; it was next prolonged to the end of the current session of parliament; and afterward, to a short time subsequent to the opening of the succeeding session. Nor were the means of resuming cash-payments wanting at the last of these periods. Corn had become plentiful among us; and the rapid successes of Bonaparte had at that time, as well as afterwards, cut short the projected duration of our continental subsidies. These circumstances, co-operating with the effect of a contracted currency (a cause which we shall more fully explain under the head Exchange), produced a great rise in the exchange between England and the Continent. Specie flowed in upon us exactly as it has lately gone out; and an opportunity was afforded to the bank directors to accumulate such a quantity of bullion as might enable them to fulfil their engagements to the public. A resolution was accordingly taken, at a court of directors, on 26th October 1707, to the effect that they were able to issue specie in any manner that might be deemed necessary for the accommodation of the public; if the political circumstances of the country do not render it inexpedient; but the directors, deeming it foreign to their province to judge of these points, wish to submit to the wisdom of parliament, whether, as it has been once judged proper to lay a restriction on the payments of the bank in cash, it may or may not be prudent to continue the same. A parliamentary committee being again appointed to report on the state of the bank, and finding that no inconvenience had resulted from the suspension of cash payments, declared that, in consideration of political circumstances, particularly the avowed intention of the enemy to injure our credit, "they were led to think it expedient to continue the restriction now subsisting."

The suspension of cash payments was now considered our settled policy for the remainder of the war. The year 1798 was as prosperous as it is reasonable to expect that a year of war can be; we had a favourable season at home, and exemption from the burden of subsidies abroad. Our naval operations were eminently successful, and our merchant convoys arrived in safety from both east and west. Bank notes were in perfect credit; and, confidence being restored among commercial men, money, as always happens in such a case, became more rapid in circulation, and comparatively plentiful. But the succeeding year presented a very different spectacle: Our government, encouraged by the accession of Russia, and in no small degree by our financial prosperity, to call forth anew the power of the Continent against France, engaged both for the payment of large subsidies, and for the maintenance of a powerful army in Holland. No sooner was the formation of this second coalition known, than the continental exchange began to bear the marks of sudden declension; and, as in 1795, it most unfortunately happened, that the evils of scarcity were added to the pressure of foreign expenditure. A season, at first promising, became extremely unproductive from continued rain, and reduced us to seek a supply from the north of Europe, the quarter to which we had already become largely indebted for military aid. The burden of subsidies was not of very long duration; the caprice of Paul, and the vigour of Bonaparte, concurred to the same end,—producing, in the first place, a diminution in the amount of our payments, and soon after bringing them to a close by a continental pacification. But the visitation of a deficient harvest took place, for the third time, in 1800,—a calamity which raised the price of corn, during that and next year, to an unexampled height. The average price of wheat during these two years was nearly £6 a quarter; and it has been declared in evidence, before a parliamentary committee, that the demand for foreign corn, before it came to a close in 1802, cost this country no less than fifteen millions sterling. Here, then, was a season of severe trial for our paper currency; and it was in the year 1800, that an observing eye could first perceive the effects consequent on the irregularity introduced into our system by the suspension of the convertibility of our paper into cash. The mode in which it
BULLION.

Bullion—

took place was this: The fall of the continental exchange in 1799, led, as it always does, to the occurrence of mercantile failures; hence scarcity of money, arising partly from actual exportation, but much more from that obstructed circulation at home which never fails to follow a want of confidence among persons in trade. The mercantile distress of the autumn of this year will be long remembered by those who were then in business in London. In this scene of disquietude and embarrassment, the eyes of the merchant were fixed on the bank. An enlargement of discounts was called for, on account both of the direct aid resulting from an increase of our currency, and the still more considerable relief which would arise from an example of confidence afforded by the bank, the reputed centre of mercantile information. The directors, had they been liable to pay in specie, would have felt the necessity of refusing all applications for an extended issue, and even of contracting their current circulation. The unfavourable exchange would have produced a run on them for guineas, which could have been counteracted only by raising the value of their paper, or, in other words, by contracting its amount. But, exempted as they were from such apprehensions; they deemed themselves at liberty to keep the state of exchange out of consideration, and to go as far, or nearly as far, as they were warranted by the validity of the bills presented for discount. The extended issue consequent on this latitude of rule, while it afforded a large profit to the bank, was productive of great relief to the mercantile body. It stopped the progress of the mischief engendered by the overthrow of the exchange; and, had future circumstances, and the disposition of the bank, led to a gradual contraction of the overissue, the public might have reaped the benefit of aid in the day of need, without much injury from future retribution. But corporate bodies are almost as slow as individuals in persuading themselves to remove the possession of advantages; the bank felt the profit of increased circulation, and did not clearly see that what was good for them could be bad for the country. The rise of bullion above paper, which had now taken place to the extent of nearly three per cent., although conclusive proof of depreciation in the mind of an attentive observer, was little understood by the public at large, and equally little by the weak ministry who had preceded Mr Pitt. It is fair to add, that the year 1802, in bringing us peace and a favourable harvest, proved by no means an era of termination to mercantile difficulties. The fall in the value of merchandise on the one hand—the dread of a renewal of war on the other—the heavy loss sustained by the contractors for the loan—were all circumstances which led the commercial body to desire a continuance of bank discounts on the enlarged scale. The abrogation of the restriction, though twice expected (1802 and 1803), did not take place; and, on the renewal of war, its continuance was regarded as a matter of course.

It may be useful here to direct our attention to the degree of increase which had taken place in the stock of bank of England notes. In regard to small notes (L.1 and L.2), nearly three years elapsed after the suspension, before their amount rose to two millions—a circumstance to be attributed to the favourable exchange of 1797, 1798, and part of 1799. But whenever the exchange underwent the serious revolution which we have mentioned, our guineas began to find their way abroad; so that, by the end of 1803, our small-note circulation had risen to four millions. The augmentation of our larger notes had been less considerable, being, in the end of 1803, only two millions and a half above the amount of the ordinary currency previous to the suspension. When we consider, that the increase of small notes, however profitable to the bank, formed rather a substitution for guineas than an addition to the mass of our circulating medium, the remaining sum (two and a half millions) appears a moderate augmentation for such years of pecuniary difficulty. To this, however, is to be added the extended issues of country banks, the amount of which had been, for some time, in a state of progressive increase, in consequence of the aid afforded them by the bank of England. That aid was partly direct, in the shape of discounts to the London agents of country banks, and to a much greater degree collateral by the general diffusion of confidence in paper money. To the two and a half millions of increase in bank of England notes, is therefore to be added an addition, probably larger, for the extension of country bank paper; and if we, moreover, make allowance for a cause of more real than apparent efficacy, we mean those improvements in banking which make the same stock of paper go a much greater way, we shall be disposed to regard the total augmentation of our circulating medium, from 1797 to 1803, as very considerable, and as affording an adequate reason for the partial depreciation which had now taken place.

If we divide the history of the bank, since its suspension, into epochs, the years 1797 and 1798 may be termed a season of tranquillity, while the following years, till the conclusion of peace, must be pronounced to come under a less satisfactory description. The renewal of war may be considered a third era; an era in which the advance of national power and prosperity was retarded by enormous burdens, but in which there was, for several years, little direct pressure on our money system. This happy exemption was owing to a double cause;—relief from continental subsidies, and from the necessity of large importations of foreign corn. The harvest of 1803 was abundant; that of 1804, although partially deficient, led to nothing in the shape of scarcity; and that of 1805, 1806, and 1807, were not, taken all together, below a fair average. In regard to subsidies, we were long unable to stir the continent to arms; and when, in the end of 1805, we had succeeded in our favourite plan of a coalition, the rapid success of Bonaparte saved us, as before, from a prolongation of remittances, at the moment (December) when their magnitude had completely overreached the exchange. Our subsequent aid to Prussia and Russia was of an extent to prevent a rise, rather than to occasion a full of exchange; and a gradual recovery began to take place after the peace of Tilsit. The first five years of the war, therefore, were a period
of financial stability; the mercantile world, if not prosperous, was exempt from any great or general disaster; and the bank, of course, from any important demands for extended issue. The directors had the prudence to keep their circulation steadily within the limit we have mentioned; and the depreciation of their paper, though continuing always at nearly three per cent. was unperceived by the public. Gold was not lower than four pounds an ounce; but it was little heard of in the market, the bank having become, in a manner, the exclusive purchasers.

We are now to enter on a fourth period in the history of the restriction act, a period altogether different from the tranquil years that preceded it. Until the end of 1807, we had conducted our military operations with a careful reference to our means, and had been hardly led into any kind of warfare calculated to expose to hazard the peculiar nature of our currency. But, at this time, all considerations of a calmer kind gave way to the call for vigour, and the stoppage of neutral trade, a measure long called for by some of the London merchants, and long resisted by government, received the sanction of the cabinet. The dull sale of our East India merchandise, the unprofitableness of ship-owning, and the annual sinking of West India property, misfortunes resulting in part from the defects of our own policy, and more from the pressure of long continued warfare, were ascribed, by the majority of the suffering parties, to the successful competition of the Americans. Mercantile men, accustomed to form their opinions from first impressions, can hardly be expected to take into view the remote consequences of the measures for which they contend. Ardent in the prosecution of the war, and unconscious that its accumulating burdens sap the foundations of their prosperity, they are much more likely to attribute their disappointments to the intrusive interference of foreigners, than to errors at home. Commercial jealousies have always been keen, and the Americans seem likely to become in our eyes what the Dutch were to our ancestors in the days of Cromwell. Her merchants seem to have persuaded government, that if neutral trade were stopped, the continent must draw its supplies from England; and that we should succeed in smuggling them in defiance of Bonaparte's prohibitory decrees. Hence, among other arrangements, the capture of Heligoland, as a station for contraband trade with the north of Germany. While her merchants calculated that these measures would relieve them of the superabundance of their produce, ministers, disposed to join in this expectation, were perhaps more directly actuated by the popularity attendant on a grand demonstration of energy against the enemy. Such was the origin of our orders in council in November 1807. By a singular coincidence, it happened that, shortly before, we had determined to consider the intercourse of America as injurious to us, Bonaparte had adopted an opposite conclusion; and, under the impression, that all maritime commerce tolerated on the continent, whether through Americans or others, must turn to the advantage of the British, had intimated to the minister of the United States at Paris his intention to permit no longer the neutrality of his country. Accordingly, his rejoinder to our orders bespoke no disposition to evade their operation, but an impatience to drive America to extremity with us, by denouncing vengeance against any of her ships which might submit to our new regulations. From these angry denunciations on the part of the two great powers of Europe, joined to the embargo adopted by congress (29th December), ensued a complete cessation of intercourse between America and the continent of Europe.

After this explanation of the stoppage of the American continental trade, it remains that we trace its effects on the state of our money system. The illustration will be useful, by conveying an idea of the complicated structure of trade, and of the fallacious nature of first impressions in regard to it. Notwithstanding the attachment to France, and the antipathy to this country, produced by the war, for American independence, the mercantile intercourse, consequent on the peace of 1783, was chiefly carried on with us. Britain alone possessed the capital indispensable to the length of credit required by a newly settled country; and while we obtained the almost total supply of manufactured goods, France and the other parts of the continent have been confined, in their intercourse with the United States, to the sale of their particular articles of produce. Such was the division of American trade twenty-five years ago, and such did it continue, with little variation in proportion, however increased in magnitude, till the issuing of our orders in council. The more the imports into the continent from the United States were augmented by the prolongation of the war, the larger became the exportations of British merchandise to America. More than half the proceeds of the American produce sold on the continent was remitted to London, and appropriated to the purchase of our manufactures. To ascertain with precision the amount of these remittances is no easy matter; but from the official documents laid before congress in 1806, they appeared, for some time back, to be from four to five millions sterling annually, or nearly L. 100,000 a-week. Such was the fund which, as Mr Baring remarks, had of late formed the support of our continental exchange. Little did our government, in meditating the suspension of neutral trade, anticipate the wound they were inflicting on our own resources; and little were the bank directors aware of the effect of the American remittances on the exchange, when they forbore to raise their voices in opposition to this favourite measure. The privation of this aid was not immediate; for although the stoppage of American arrivals in the continent took place in February 1808, the sale of goods and remittances to England continued till the autumn of that year. We were then deprived of this ample fund, and the exchange underwent a depression, from which it has not yet recovered.

The next cause of the fall of our foreign exchanges in 1808 was of a very different nature, and consisted in the pecuniary aid contributed by us to res-

Bullion.

The trade to our continental trade, by the enforcement of Bonaparte's prohibitory decrees, which to many appear the great and sole source of the evil, rank only fourth in our catalogue of causes. Serious as these obstructions have now become, their operation has been of much later date than the majority of the public are aware of. Bonaparte felt, at every step, the injury which they created to himself, in revenue as in popularity, and used to connive at their evasion, after having nominally enjoined their execution in the most positive terms. The year 1809, though posterior to his vehement proclamations, was a season of very active intercourse between England and the continent. This intercourse was maintained during the first half of 1810; and it was not until the continued depression of our exchange, and the multitude of our mercantile failures, inspired him with the hope, that a rigorous enforcement of his decrees would complete the measure of our embarrassments, that he began to act up to the letter of his edicts. Accordingly, it was only in the winter of 1810 that seizures of British property were made in the Prussian harbours, and that the ridiculous extreme of burning our goods was resorted to in his own dominions. If we look to the magnitude of our exports to the continent of Europe, down not only to 1810, but to the present date, we shall have reason to be surprised, that they so much exceed the limited calculation, which a sense of the multiplied impediments would lead us to form. Still, however, a trade conducted under such disadvantages of expense and hazard, must be infinitely less productive than if direct and unrestrained. In regard to the exchange, it will be found, when attentively scrutinized, to operate less as an original cause of malady than as a prevention of cure. But free transmission of commodities, which forms the natural remedy to an unequal exchange, is now denied us; and the evil, when once in progress from other reasons, is maintained in all its virulence by the effect of these hostile decrees. Among the minor causes of the fall of exchange, might be enumerated the heavy sums paid for freight to foreign shipmasters, Bonaparte's prohibitions of remitting bills to England, and the usual amount of foreign property (L.1,040,000)* sold out of our funds, and remitted to the continent in 1810. But enough has been brought forward to account for the occurrence of this distressing event, and it now remains to explain its effects on the state of our money system.

* Chalmers' Considerations on Commerce and Bullion, p. 72.
Bullion.

Bullion.

The double burden of subsidies and corn-payments. In the still more serious difficulties of 1799 and 1800, this severe remedy was only partially applied; a proportion of our bullion and coin went abroad, but paper supplying its place, the cure was not radical, and our bank-notes remained at a depreciation. No improvement took place during succeeding years. It was our misfortune to meet the accumulated demands of 1806 with a deficiency in our coin, and a degradation in our paper. The progress of the evil was consequently rapid, bullion rising 15 per cent. above its coining value so early as the spring of 1809, (Lloyd's List,) and bank-notes falling currently to a discount before the end of the year. All the expedients applicable to such a state of things,—export of goods, transmission of bullion, smuggling out of coin,—were put in practice by the keen and adventurous classes of society, who make it their business to resort to such means. But their efforts were unavailing: the heavy demands from abroad, and a non-convertible currency at home, baffled all ordinary corrections. It may be worth while to consider, what would have been the course of things, had a similar revolution in the exchange occurred at a time when the Bank was liable to pay in specie. Whether the sum of evil would have been greater or smaller, its progress and character, there can be no doubt, would have been altogether different. The state of the exchange producing heavy demands on the Bank, for guineas to be melted and exported, that establishment would have withstood with recourse to the well-known remedy of contracting its issues. The claims of government, however urgent, must have been resisted, and the accommodation of discounts almost wholly withdrawn from trade. The consequences would have been an unavoidable relaxation of our exertions in Spain,—a general fall in the value of commodities,—an embarrassment almost universal among our traders, leading, in innumerable cases, to a temporary suspension of payments, and in many to bankruptcy. All this would have taken place so early as 1809; the deficient harvest of that year would have aggravated our distress; and a defalcation in the public revenue, similar in its cause to that which has just occurred, but greater in extent, would have been inevitable. Our exchange, however, could hardly have fallen below 10 or 12 per cent.; and the correcting powers of trade, if impeded by Bonaparte, would have experienced no incumbrance from the state of our own currency. Such would have been our situation, had we encountered the whole of our calamity in the outset, and sought for no palliation in the substitution of paper for coin. But as things have been ordered, the substitution of paper has both retarded the approach of the evil, and concealed from us its real character. The exchange had been deranged during eighteen months, before the mercantile embarrassments became serious; the Bank, instead of narrowing, consented to increase its issues; the foreign expenses of government underwent no diminution; nor has there been any general fall in the value of commodities. On the other hand, the exchange continues, in this its fourth year of depression, so low as 20 or 22 per cent.; the list of mercantile failures appears to suffer no reduction; and the effect of any measure of relief that may be adopted by government must necessarily be remote. It is difficult, therefore, to pronounce, whether the continued use of paper money has lessened or aggravated the pressure resulting from political and commercial causes; the stroke was less sudden, but the ground is perhaps deeper. It is foreign to our plan to enter into political calculations, but that is one idea too important to be omitted: Had the Bank been subject to cash payments, the ruinous consequences of stopping the American trade must have been so soon perceived, that our orders in council would have speedily been recalled, or, more probably, would never have been issued.

After this narrative of the progress of our paper currency, it remains for us to direct our attention to the measures proposed to remedy its depression. In February 1810, a Committee of the House of Commons was moved for by Mr Horner, to "enquire into the cause of the high price of gold bullion, and to take into consideration the state of the circulating medium of exchanges." A committee was accordingly named, without much interference, it has been said, on the part of ministers, and was occupied during two months in the examination of evidence. The persons examined were chiefly bullion dealers, merchants, bankers, and bank directors. The leading members in the committee, next to Mr Horner, are understood to have been Mr Huskisson and Mr Henry Thornton. It is the custom, in parliamentary committees, after hearing evidence, to adopt certain resolutions explanatory of the sense of the committee, and of the substance of the report about to be framed. It was only in this stage of the business, we understand, that Mr Perceval began to apprehend a decision contrary to the views of the Bank and of government. Coming personally to the committee, which he had hitherto very little attended, and collecting those of the members whose ideas were coincident with his own, he endeavoured, it is said, to negative the proposition, that bank-paper was understood to be depreciated, but in vain; the majority of the committee having made up their minds to an opposite conclusion. The report accordingly went on; but so complicated was the labour, that, notwithstanding the time already bestowed, and the familiarity of the subject to the gentlemen whose names we have mentioned, above a month was required for its completion. It begins with a statement of the extraordinary rise of bullion in our market, and of the endeavours of the committee to ascertain what cause, in the opinion of mercantile men, had led to this irregularity. To the notion entertained by several witnesses, that it was owing to a rise of gold on the continent, the committee could by no means subscribe. The sudden rise in our foreign exchange formed the next topic of enquiry; and here, as in the other point, the committee differ from the opinions of practical men, the majority of whom attributed it to the foreign expenses of government, and to the excess of our imports in 1809 above our exports. Two merchants, however, if they did not go so far as the committee, in declaring a depreciation of our bank-notes, were of opinion, that their non-convertibility into cash had been materially instru-
The third subject of investigation, the inquiry into the rules of the bank in respect to their issues, gave rise to some anxious answers. The bank directors appear to have become by this time suspicious of the intentions of the committee, and sought hard to ward off (Evidence, p. 79 and 89) some of their probing questions. The point on which they were chiefly at variance, was, whether the amount of their issues ought or ought not to be regulated by a reference to the price of bullion, and the condition of the foreign exchange. The committee contend for the affirmative, while the bank assert, that the validity of the bills presented to them for discount, should form almost the only subject of consideration. The bank also oppose the idea, that the irregular state of the exchange is owing, in any degree, to a degradation of their paper; an allegation which leads the committee into a series of arguments to shew that depreciation has been known to exist in cases where the currency was, like that of the Bank of England, of undoubted character as to ultimate solvency. The early part of the history of the bank of England itself, the case of the Scotch banks in 1763, and the more recent example of the bank of Ireland in 1809, are all adduced in support of this position. The committee then conclude this part of the Report, with a mixture of praise and censure on the bank directors. Their conduct, in not attending to the price of bullion and state of exchange, is said to involve "great practical errors;" while their moderation in "limiting the amount of their issues, is declared to entitle them to a continuance of the confidence so long reposed in them by the public." The fourth and last division of the Bullion Report, regards the progressive increase of our paper currency. After exhibiting a list of the annual quantity of bank of England notes in circulation since 1708, and commenting on the bank advances to government, as well as to the mercantile body for discounts, the committee are led into an enquiry into the circulation of country banks. Here, from the scantiness of materials, the greatest caution was necessary; and from the want of it the committee have fallen into very serious mistakes. They sum up the Report by declaring the existence of an excess in our paper currency; by ascribing this excess to the absence of the salutary check of cash payments; by lamenting the evils attendant on depreciated currency; by dissuading the adoption of any indirect schemes to limit our paper circulation; and by recommending an act of parliament to resume cash payments within the space of two years.

Having thus communicated the substance of the Report, we shall venture to make some observations with regard to its accuracy. Without joining in the popular exclamation, that it is the production of theorists, we are of opinion, that the most correct part of it is the exposition of the principles of money and exchange; and that, in several other points, it is defective, from an unacquaintance, on the part of the framers, with the practice of mercantile business. They have fallen into the current error of imagining, that the obligation of cash payments once withdrawn, it was in the power of the bank to increase, almost ad libitum, the extent of their circulation. They appear very inadequately impressed with the power of the public to limit the circulation of bank notes, by withholding applications for discount; a power very happily illustrated by Mr Bosanquet, one of the most ingenious defenders of the bank.† Had the committee been sufficiently aware of this, they would have paused before asserting (Report, page 24.) that "the suspension of cash payments had had the effect of committing into the hands of the directors of the bank of England, to be exercised by their sole discretion, the important charge of supplying the country with that quantity of circulating medium which is exactly proportioned to the wants and occasions of the public." Perhaps, also, they would have qualified their encomium on the directors, for their "forbearance in turning their power less to the profit of the bank than it would easily have admitted of." Our next animadversions on the writers of the Bullion Report, regards their inattention to the striking points in the history of our paper currency since the beginning of the war of 1798. No notice is taken of the pecuniary embarrassments of 1795 and 1799; nor is any attempt made to ascertain the causes of the remarkable increase of bank notes subsequently to the latter year. These were not topics of mere curiosity; they bore, as we have endeavoured to shew, a direct resemblance to the unfortunate circumstances of the year 1808. The chain of reasoning supplied by a knowledge of antecedent difficulties, would have led the writers of the Report, by an easy course, to an estimate of the share which our expenses in the peninsula, and our importations of corn, have had in our recent difficulties. Perhaps, also, it might have conducted them to a discovery of the evil of a new kind, which we had brought on ourselves, by stopping the American continental trade. To have enumerated, and made allowances for the operation of those powerful causes, would have carried conviction to the minds of the mercantile community, and have disarmed their opponents of their most efficient weapons. Enough would still have remained to substantiate the charge of depreciation, and to justify the argument, that had our paper been convertible into cash, the disorder in the exchange would have been neither so great nor so permanent. But as the Report stands, no notice is taken of the increase of our foreign expenditure in 1808; no reference is made to the deficient harvest of 1809; and the American trade, though alluded to in the evidence of their favourite witnesses, (Appendix, p. 78, 150, 151.) is allowed to pass unnoticed by the committee. An acknowledgment, indeed, is made (Report, p. 16.) of the influence of political and commercial causes.

† Bosanquet's Practical Observations, page 87.
but it is couched in general terms, and the topic is
forthwith exchanged for an argument on the degra-
dation of paper.

We have already mentioned, that the fourth divi-
sion of the Report, which treats of country banks, is
particularly liable to animadversion. Without dwell-
ing on the errors in the attempt to ascertain (p. 29.)
the increase of their circulation, we shall confine our-
selves to the consideration of a general position, tak-
en from Mr. Thornton's book on paper money, and
couched (Report, p. 28.), in very prepossessing terms.

"If an excess of paper be issued in a country dis-

tric, while the London circulation does not exceed

its due proportion, there will be a local rise of prices

in that country district, but prices in London will

remain as before. Those who have the country pa-

per in their hands, will prefer buying in London where

things are cheaper, and will, therefore, return that

country paper on the banker who issued it." The

error of this argument lies in supposing that the

London market forms a direct check on the country

markets, as if the commodities purchased in the one,

were not, in general, quite different from those of the

other. In the metropolis, imported merchandise forms

the great article of sale; in the country towns, the

produce of the land, and the local manufactories.

The check on the over-issue of paper must arise from

very different sources, and will be found to consist

fundamentally in the obligation to pay interest; a sacrif-

cice which no man will incur without cause. Anoth-

er and a more serious fault in this part of the Re-

port, consists in the loose manner in which the great

rise in the price of commodities is charged on our pa-

per currency. The committee dwell largely on the

magnitude of the evil, without attempting precision

in regard to the share which the over-issue of paper

may have had in it. From this vague mode of ex-

pression, the public are led to infer, that the unfor-

tunate rise of our commodities might have been pro-

duced by the conduct of the bank, although neither

new taxes nor new corn-laws had been in existence.

Now we have no hesitation in attributing a part of

the rise to over-issue of paper; but, on resorting to

the ordeal of close calculation, we find that part

much smaller than is generally believed. If to the

depreciation of three per cent. which has lasted since

1800, we add six or seven per cent. for the overissue

of the last three years, (and more we cannot perceive

 applicable to our home transactions, whatever may be

the case as to our foreign,) we set down in all an

enhancement of ten per cent. to charge of our paper

currency. But the total rise in the price of commodi-

ties since the bank suspension of 1797, exceeds, as

is well known, sixty per cent., leaving five-sixths of

the burden to be otherwise accounted for. In anoth-

er and a more extended point of view, we should

have little difficulty in bringing an additional part of

the charge against paper money. War is the great

cause of the rise of prices; and the aid of paper mo-

ney, perhaps the exemption of the bank from cash

payments, may be pronounced one of the principal

reasons why we are not now at peace. But such is

not the meaning of the bullion committee. They

make no reference to the rise of prices produced by

the use of paper money; their business is with the

abuse of it; and there, we cannot help thinking, they

have over-rated the extent of the effect.

It would have been desirable also, that the bullion

committee, in urging the pernicious effect of our pa-

per currency on the exchange, had more clearly dis-

tinguished between non-convertibility and over-issue.

In the first and more accurate part of the Report,

the non-convertibility of our paper into cash, enga-
ges a share of their attention, which seems to be af-

terwards lost amidst their extraordinary calculations

of over-issue. It has unfortunately happened, that

several of the writers who have followed on the same

side have laid the chief stress on the latter; excess of

quantity being, as Mr. Burke said of force, one of the

apparent means most likely to arrest the belief of su-

perficial inquirers. To these animadversions on the

Report, it is proper to add, that it is rather an able

exposition of the doctrines of others, than an original

work; a remark in which those to whom Dr Smith's

book, Henry Thornton's Inquiry, and the Thoughts

on the Restriction Bill by Lord King, are familiar,

will have no hesitation in joining. Yet, in spite of

all these deductions, the Report of the Bullion Com-

mittee is entitled to great consideration. It affords

an example of what we have long wanted in this coun-

ty—the application of the principles of political eco-

nomy to the practice of trade. It is the fruit of

close thinking and wide research, and its errors are

chiefly to be ascribed to the singular complexity of a

subject, a knowledge of which would appear the task

of years rather than of months. If we make allow-

ance for the impressions, in several respects exagge-

rated, under which it was written, we shall find rea-

son to praise its moderation, particularly when put in

contact with the positive and absolute language of

other productions. We shall conclude our remarks

on it by desiring those to whom this qualified encomi-

um may seem too favourable, to compare it with the

hasty statements and meagre reasoning which so

often characterize the labours of other parliamentary

committees.

If we direct our attention to the principal writers

who have appeared on this most fertile of topics, we

find in Huskisson a great deal of anxiety to make the

public thoroughly acquainted with the merits of the

question; in his antagonist Bosanquet, strong evi-
dence of acuteness, unaccompanied, however, by an

adequate knowledge of general principles; in Ricar-
do, accuracy and promptitude in calculation. Among

the lesser tracts, Jasper Atkinson’s Letter to a Mem-

ber of Parliament, contains a clear and temperate

argument against the Bullion Report; while Wilson’s

Observations on the Depreciation of our Currency,

will remove the doubts of the few who question the im-

plicity of our corn-laws. In Canning’s printed speech,

the reader admires more a display of oratory, than a

knowledge of the subject; while that of Mr George

Johnstone claims attention for polished language, as

well as for perspicuous illustration. He who desires

to acquire a knowledge of the intricate subject of ex-

change, will do well to study the publication of

Blake; and an instructive example of the causes of a

bank stoppage will be found in the official report of

Dupont de Nemours on the embarrassments of the

Banque de France in 1806.
We cannot help thinking, although the remark has nowhere been made, that had the bank suspension not taken place in the spring of 1797, it would, in all probability, have been unnecessary down to the present day. When the credit of an establishment stands so high, there is no hazard of a run for cash for the purposes of inland trade; the demand can be only for foreign use. Now it so happened, that our great continental subsidies came to a close in 1797, and though thrice renewed since that time, they on no occasion lasted so long as to create embarrassment to the bank. Had we ventured, without the aid of the restriction act, to form the coalition of 1799, the cash, which was at that time abundant in the bank coffers, would have supplied the chief part of the subsidies. This point once adjusted, it is scarcely probable that any considerations arising out of the want of foreign corn, would have induced ministry to resort to the unprecedented and alarming measure of suspending cash payments. If we suppose that critical interval got over, we shall find no combination of circumstances of more recent date, likely to necessitate the adoption of the measure. The war in Portugal, like the war in Flanders of 1793 and 1794, is in a great measure defrayed by the supply of stores from home; the prohibitory decrees of Bonaparte may prevent the recovery of our specie, but could hardly have drained it from us; and in regard to the American continental intercourse, the bank directors would not have failed to oppose the clamour of the ship-owners, and stay the hand of ministers, had the liability to cash payments been in force. It is true that the alarm of invasion was great during the two first years of the present war, but to those who apprehend danger to the bank from such a cause, we would submit two important considerations; first, that those alarms are, in great part, the act of our own government, with the design of keeping us prepared; for, in the beginning of 1797, at the very time when ministers were loudly promulgating danger. Mr Pitt, on finding that it had produced a drain of cash, made this remarkable admission, in his conference with the bank directors (21st February), that “the alarm was now become much more general than he could think necessary.”† The next point is, that the dread of invasion need not, unless accompanied by an unfavourable exchange, deter the bank of England from increasing the amount of their circulation. Notes of such high credit would continue to obtain currency for commercial as well as financial purposes, and we have the authority of the Bullion Report (p. 27.) for the inference, that, had the bank boldly increased their issues in February 1797, there would have been little danger of a stoppage—an additional proof how near we were to an exemption from that mortifying alternative.

Fallen in some degree, as we must admit our paper money to be, a retrospect of its history, and a comparison with that of our neighbours, will not fail to suggest to us several flattering considerations. In looking to the example of the French republic, and, more recently to those of Austria, Russia, and Sweden, we find their paper currencies doomed, as soon as government interferes, to rapid depreciation. Among us, ten years elapse after so great an irregularity as the stoppage of cash payments, without any farther degradation than three per cent. The source of this comparative superiority will be found, in our long established habits of industry, and that promptitude and regularity in our transactions which are its happy consequences. But the more immediate causes have been the productiveness of our taxes, and an independence of government, almost complete, on the part of the bank. Without denying the necessity of partial improvement in the constitution of that corporation, it may be justly said, that they never force a note into circulation, and that the principal addition made to their paper since the suspension, have borne less the character of voluntary emissions than of advances for the relief of trade. Open as some parts of their conduct are to censure, we may safely say, that, with the exception of Holland in its better days, no country in Europe would have afforded an example of a delicate trust discharged with such a share of honour and moderation.

In comparing the price of bullion in our market with the state of our continental exchange, since the commencement of the present depreciation, we find a difference often of eight per cent.; that is, while bullion is fifteen per cent. above coinage value, the exchange with Hamburg or Holland may be so much as twenty-five per cent. against us. This difference appears to represent the expence and hazard on the conveyance of specie to the continent. Inadvert in the parliamentary transactions relative to bank notes, we find that the act of 1797 went no farther than suspending the arrest of the persons and goods of a debtor after he had made an offer of payment in bank notes; and even that the act of July 1811, founded on Lord Stanhope’s bill, did not go so far as to make bank notes a legal tender, its principal provisions being to impose a penalty on buying or selling them at a discount.

If we refer the practical results of trade to the principles laid down by our illustrious countryman, Dr Smith, we shall generally find reason to admire the soundness of his conclusions. Though partial to the use of paper money under due restrictions, he is yet aware of its comparative instability, and gives his readers cause to be prepared for the recurrence of such embarrassments as those of 1793 and 1795. In regard to the country banks, he apprehends no danger from their multiplication, so long as they are bound to pay their notes in cash, and are restrained from issuing any under five pounds. Such was their situation previous to 1797. When we consider the general prejudices against private banks, it seems not unlikely that their exemption from interruption on the part of government was, in some degree, owing to the weight of Dr Smith’s authority. Since 1797, though deprived of their title to his recommendation, they have had but too powerful a hold both on government and the country, in consequence of the public necessities; and that remedy, which brings them back to the observance of former rules, must be slow of operation, and accompanied, we fear, with considerable embarrassment to the public. BUNKER'S HILL. See America Index.

BUNYAN, JOHN, best known as the author of the Pilgrim's Progress, was born near Bedford, in the year 1628. His father, though a tinker, gave him a better education than usual, by having him taught to read and write. But being of very forward disposition, and much exposed to the contagion of bad example, he early began to indulge in all manner of vice, and soon became, in every respect, a notorious profiteer. During his wicked career, however, he had frequent and strong convictions of guilt. Various circumstances occurred to lead him to serious reflection on his conduct. His imagination was so powerfully impressed, that he thought he heard a voice from heaven warning him of his danger. And the result of all this was a complete and permanent reformation of character. About the year 1655 he became a member of a Baptist society at Bedford; and was so zealous in his religious profession and practices, which stood directly opposed to those of the court, that, after the restoration, he suffered, along with multitudes of his fellow Christians, the severest persecution. Having transgressed the law against conventicles, that is, having chosen to worship God according to the dictates of his own mind, and to maintain, with earnestness, his own views of scripture doctrine, he was indicted, at the instance of the king, at the trial at the Bedford quarter sessions for his alleged offences, and was found guilty of "devishly and perniciously refusing to go to the established church, and upholding unlawful meetings, to the great disturbance and distraction of the kingdom." His trial was conducted with the characteristic injustice and tyranny of those times. The facts stated in the indictment were not proved. No witnesses were adduced against him. Some words, which accidentally fell from him in conversing with the justices, were taken for a conviction. And these worthy administrators of the acts of Charles II. actuated by the spirit, and obedient to the will of their master, pronounced upon poor John Bunyan a sentence of perpetual banishment. This sentence was not executed, but its victim was cast into prison, and remained there for twelve years and a half, enduring his wrongs with much patience, supporting himself and his family by making tagged laces, and engaging in religious exercises with above sixty dissenters, who were confined in the same place for the same illegality. He was at length enlarged through the benevolent interference of Dr. Barlow, Bishop of Lincoln. During the last year of his imprisonment, (1671) he was unanimously chosen pastor of the congregation at Bedford, to which he belonged. And afterwards taking advantage of James the Second's declaration in favour of liberty of conscience, he built, with the assistance of his followers, a public meeting-house in that city, in which he regularly preached to large and admiring audiences. It is said that Dr. John Owen was one of his hearers, and gave countenance to other respects to his ministerial labours. He died in London, on the 31st of August 1689, in the 60th year of his age.

Bunyan laboured under great disadvantages, in point of education and external circumstances; but he seems to have possessed no inconsiderable portion of genius; and had he been more favourably situated, would probably have made a greater figure in the world than most of his contemporaries. Of this we have sufficient proof in his Pilgrim's Progress, a work which has no equal in popularity, and which is distinguished by many real excellencies, both as a work of poetic fancy and of practical divinity. The allegory is well conceived, and well conducted. It frequently offends by its coarseness and vulgarity, but at the same time excites so much dramatic interest, and gives such lively delineations of real life, as to make the reader overlook these minor defects. The theology which it teaches, is systematic Calvinism: it is Calvinism, however, coming home to the Christian's experience, and producing its moral effects on his heart and conduct. And it is a well-known fact, that few books have done more good among the people than the Pilgrim's Progress. Though the merits of the author are universally acknowledged, it is not generally known that he had the model of this work before him, in the Isle of Man, or the Legal Proceedings in Manshire against Sin, a curious little allegory, written by the Rev. Richard Barnard, and published in the year 1626. Bunyan produced various other pieces of inferior merit. Of these, the Holy War is in greatest repute among the lower orders, for whom it is, from its style and manner, chiefly intended. A complete edition of his works was published in 1767, in two volumes folio, adorned with copperplates, and accompanied with a recommendatory preface by Mr. George Whithfield. See Grace abounding to the Chief of Sinners, in a faithful account of the Life of Mr John Bunyan. This is written by himself, and contains a very particular account of the conferences which he had with the judges by whom he was tried, and of the oppressive manner in which he was treated by his persecutors. It is in this, as in several other respects, an excellent picture, both of Bunyan himself, and of the times in which he lived. See also Grainger's Biograph. Hist. of England; Account of the Life of Bunyan, prefixed to the above-mentioned edition of his works; and Biograph. Brit. (?)

BUONAROTTI, MICHAEL ANGELO. This celebrated person, who has generally been considered as the great restorer of the arts of painting, of sculp-
Buonarotti, and of architecture, was born in 1474. The place of his nativity was Castel Caprese, in Tuscany; a fortress of considerable importance in the commonwealth of Florence, of which his father was governor. He is said to have manifested, even in his childhood, a powerful propensity to the arts which afterwards immortalized his name; and when put to school, under the tuition of Francesco d'Urbino, he obstinately persevered in devoting so large a proportion of his time to drawing, that he made little proficiency in his other studies. It was with great reluctance that his father and his other relations consented to his persevering inclinations; and so far sacrificed their own views of family dignity, as to permit him to enter upon the regular study of painting as a profession. At the age of fourteen he became the pupil of Dominico Ghirlandaio, a painter of no inconsiderable merit, when we take into account the false taste which had so generally degraded the art at the period when he began to exert his talents; though, at the same time, it must be admitted, that to the future eminence of those illustrious men who issued from his school, rather than to his own individual success, he is indebted for the place which is assigned to his name in the remembrance of posterity. Michael Angelo alone secures it from the possibility of oblivion.

It has been mentioned, as an honourable testimony of the high expectations which Michael Angelo had already created, that, on entering the school of Ghirlandaio, it was stipulated that his master should pay him an annual salary, although custom had established the contrary practice of paying to the master a considerable premium. It is said, that the jealous temper of Ghirlandaio operated as a frequent bar to the advancement of his pupils; and Condive has asserted, what cannot be strictly true, that Michael Angelo became so marked an object of his envy, that he derived no benefit whatever from his instructions. To acquire the power of minute imitation, was the great object of his first ambition; and, notwithstanding the deviations from individual nature, which his powerful and poetical mind enabled him at an after period to practise with unexampled boldness and success, it is instructive to know, that, at his outset, perhaps no man ever devoted himself with more unwearied assiduity to the literal and accurate representation of whatever he attempted to paint: nor was it till he had secured actual and real nature as his conductor, that he ventured forth into the perilous regions of ideal grandeur and sublimity.

Among the circumstances which, at this remarkable period, conspired to favour the progress of the arts in Italy, while much must be ascribed to the general diffusion of a strong and enlightened relish for them in the public mind, they were peculiarly indebted to the liberal and munificent patronage of the family of Medici. About this time the art of sculpture was supposed to be less understood than that of painting: and it was with a view to its encouragement that Lorenzo de Medici formed an ample collection of statues, busts, and basso-relievos; and free access was afforded to all who were desirous of forming their taste, by studying and drawing from the antique. Of this opportunity Michael Angelo did not fail to avail himself; and though his first intention had only been to improve himself in the knowledge of drawing, he soon became enamoured of the art of sculpture; and the success which attended his first efforts, effectually procured him the marked notice and patronage of Lorenzo. This was the commencement of an intimacy, which was not less advantageous than flattering to Michael Angelo. As yet only about fifteen years of age, he was invited to live in the house of Lorenzo. He was treated as a friend,—he enjoyed the conversation of men of rank and genius,—he was permitted free access to the gems and works of art, which were fitted to improve his taste,—and was accommodated with whatever could contribute to his comfort or to his progress.

The death of Lorenzo, which happened about two years after, was an irreparable loss to the arts. His successor Piero continued, indeed, to afford them that kind and degree of patronage which consisted with the worthlessness of his character and the depravity of his taste. Michael Angelo, who enjoyed a share of his notice and employment, still continued to reside in the palace; and his protector was proud to say, that he had two eminent men under his roof,—a Spanish footman, remarkable for his speed in running, and Michael Angelo. By order of Piero, Michael Angelo executed several works of sculpture; but the disturbances which arose in the state of Florence induced him soon after to retire to Bologna. Here he was received with flattering marks of consideration, and executed two statues for the church of St Dominico.

After his return to Florence, he executed a variety of admirable sculptures, particularly the well-known colossal statue of David, which was placed in front of the Palazzo Vecchio. The statue of Moses, executed at a subsequent period, is generally acknowledged to possess, in a higher degree than any of his other numerous sculptures, that character of majesty which more or less appears in the whole of them.

Whether Michael Angelo excelled most in painting, in sculpture, or in architecture, it would be no easy task to determine. "Of a genius," as is observed by one of his most zealous admirers (M. Fuseli), "who succeeded beyond rivalry in whatever he undertook, it is difficult to fix the principal sphere; but it appears to be incontestable, that however great the loss, in such a case, might have been to either art, painting would have suffered more if deprived of his powers than even sculpture. In sculpture we possess the reliques of the antique,—works that more than rival his. But what is there in painting that could compensate for the loss of the Sistine chapel?"

The pictures which occupy the ceilings of this edifice were finished in the year 1512: and it stands on undoubted evidence, however fabulous it may seem, that the time spent in the execution of this stupendous monument of human genius, did not exceed twenty months. The celebrated picture of the Last Judgment, which fills the façade of the chapel above the altar, was a subsequent performance, executed during the pontificate of Paul III.; who, soon after his accession, paid a visit to the artist in person, attended by ten cardinals, to solicit him to undertake the work. It was finished in 1541; and, ac—
Buonarotti, according to Vasari, was accomplished in less than seven years.

In the chapel called the Paulina, from its founder Paul III., Michael Angelo, when advanced in years, was employed to paint the Conversion of St Paul, and the Crucifixion of St Peter. They are generally considered as greatly inferior to the works in the Sistine chapel.

It is commonly said that Michael Angelo entertained a contempt of oil painting, and used to call it the work of wenches and idlers. Whether he ever practised the art himself is doubtful; the fact at least rests on very slender evidence; as several works of his hand, which were long supposed to be in oil, have recently been discovered to be in distemper, and the picture of David and Goliah in the Louvre is not considered as genuine. According to the opinion of M. Fuseli, it is the work of Sebastian del Piombo.

The church of St Peter's is the splendid monument of Michael Angelo's genius and success as an architect. This fabric was begun by Julius II. in 1506, and entrusted by him to the superintendence of Bramante. After his death, the care of this immense work was conferred on Antonio de San Gallo. After the work, by the change from one plan to another, had, as it advanced, threatened to turn out a mass of jarring incongruity, it was submitted to the judgment and direction of Michael Angelo, who, notwithstanding its complexity, simplified and harmonised the whole.

To whatever department of art Michael Angelo applied the powers of his mind, he seems from his first outset to have evinced an energy, originality, and sublimity of conception, almost peculiar to himself; and which has led some of his admirers to speak of him as of a being gifted by nature with powers of a superhuman order. Majesty and grandeur are the great characteristics of his style: character and beauty he admitted only as far as they could be made subservient to these more exalted qualities. Considered as a painter, it was his glory to raise the art far above what is included in the mere imitation of nature, and to place it on a level with the heroic in poetry. And it seems generally admitted, that the success with which he accomplished this is such as to leave far behind whatever has been attempted with similar views since his time. One of his most enlightened admirers, and most devoted and zealous encomiasts, Sir John R. Reynolds, denominates him "the exalted founder and father of modern art; of which, he adds, he was not only the inventor, but which, by the divine energy of his own mind, he carried at once to its highest point of possible perfection." The characters represented by Michael Angelo possess that kind of elevation above common and individual nature, which belongs to the personages of Homer or of Milton. In either case, although nature supply the materials, it is the boast of art to new model and arrange them to the production of something higher and more perfect than real life ever presents to our observation. And nowhere, perhaps, are there higher examples of the extent to which this may be successfully carried, than are furnished by the works of Michael Angelo. The personification of the Supreme Being, in the centre of the Capella Sestina; the Sybils and the Prophets in the same chapel; are all instances of this, in which the human Buonarotti form and expression are elevated to a character of grandeur and majesty far beyond the pitch of actual nature, as it is anywhere exhibited to our senses.

It is obvious, that the habits of mind which consist with the power of conceiving and expressing this ideal perfection and grandeur, are of a kind which unavoidably expose those who fearlessly obey their impulse to the hazard of occasional caprice and extravagance. From a charge of this description the most partial admirers of Michael Angelo do not attempt to vindicate him. Habituated as he was to move in a higher region, which disowns those visible landmarks and limitations that effectually guide and restrain the inferior walks of the art, he sometimes seems hurried away by the impulse of an inventive and fruitful mind, which for a time has ventured to trust imagination without its accustomed curb. It is not without reluctance that some of his ablest defenders have been forced to own, that there are figures of his, of which it is difficult to determine whether they are in the highest degree sublime, or in the greatest degree ridiculous. If this reflection have any just application to Michael Angelo, it is doubly applicable to many of those who have since enlisted themselves in the numerous train of his imitators, for whose follies and absurdities it has often been his fate to suffer indiscriminate and unmerited censure.

The colouring which Michael Angelo adopted is the reverse of that which is peculiar to the ornamental style; and whether it would have been an advantage had it possessed more of that splendour which is admired in Titian, is a point which has frequently been disputed.

From his infancy he was distinguished for unwearied diligence, and this was in general continued through his whole life, till old age subdued the vigour of his gigantic faculties. There was one considerable period, indeed, during which these faculties were most shamefully misapplied; and that this loss to himself and to mankind originated in an express command of one whose chief ambition it was to be distinguished as the most magnificent and enlightened patron of the arts, is a reflection calculated only to aggravate that stigma which the unpraisable absurdity of such a transaction affixes to the boasted character of Leo X. During the whole reign of that celebrated pontiff, a period of more than eight years, the chief occupation assigned to Michael Angelo, was to superintend the quarrying of marble amongst the mountains of Pietri Santa, and the formation of a road to convey it to the sea. Nor can it be received as any apology for having ordained this criminal expenditure of divine talents and genius, that Leo X. was, in fact, aware of their excellence; and that the task which he imposed on their possessor, was only intended as introductory to more considerable works of sculpture and of architecture, of which Michael Angelo was afterwards to have the direction.

Michael Angelo died in 1564, at the advanced age of 90 years. He was of the middle stature, of a bony and spare make. His countenance was disfigured by a blow which he received in his youth from his cotemporary sculptor Pietro Torrigiano. (1)

BURFORD, a market-town in Oxfordshire, about 72 miles W. N. W. from London, is situated on a rising ground, near the river Windrush, and is chiefly remarkable as being one of the oldest towns in the Mercian kingdom. Many of the houses are modern built; and the church, which is a spacious and handsome edifice, with a very fine spire, displays some curious specimens of ancient architecture. The south porch is highly decorated; and the entrance on the west is ornamented with birds heads, &c. Burford has a considerable manufactory for rugs and stuffs, but it is particularly famous for saddles. Though not a corporate town, it is governed by two bailiffs, and has a common seal. The horse races, which are held on the neighbouring downs, are much frequented by the Oxford students and the surrounding gentry. A field, called Battleedge, a little west of the town, is shewn as the scene of a dreadful conflict which happened in 752, between Ethelbald, king of Mercia, and Cuthred, king of Wessex, when the former was completely defeated; and a festival is still celebrated by the inhabitants on Midsummer eve, in commemoration of the victory. It has two annual fairs, and a market on Saturday, which is well supplied with cattle and corn. It contains 304 houses, and 1516 inhabitants, of whom 690 were returned in 1801 as employed in trade and manufactures. N. Lat. 51° 50', E. Long. 1° 38'. (4)

BURGAGE-TENURE, is a species of holding known to both the English and Scots law, by which a proprietor of lands, houses, or other tenements, within the liberties or incorporated territory of a borough, holds of the king, or other person, under the burden of certain services to the borough, or a fixed rent-charge to the lord. In England, it is considered as a relic of the ancient Saxon liberty, being nothing else than a tenure in socage, the free or certain nature of which the lawyers of that country are fond of tracing to those remote times. Hence they account for the variety of customs, not strictly feudal, by which property held under this tenure is affected. Among these the most remarkable seems to be, that known by the name of Borouam-English, of which we have already given some account. In some English boroughs, too, the widow has right, by privilege of this tenure, to be endowed of the whole of her husband's tenements, and not of a third only, as at common law. In others, the tenements might have been disposed of by will, previously to the statute of Henry VIII., by which that right was made universal. There are about 29 burgage-tenure boroughs in England, in which the right of voting for burgesses to serve in parliament belongs to every individual proprietor of an house, tenement, or pot of ground on which a house has anciently stood.

With regard to Scotland, it has been doubted whether this species of tenure, properly understood, is peculiar to royal boroughs, or whether it extends in some instances, as in that of Paisley, and perhaps some others, to boroughs of an inferior order. Be this as it may, as, in royal boroughs, the whole community is the king's vassal, in virtue of the original charter of erection, so each individual proprietor holds of the crown, (except where the lands, or other tenements, originally held of a subject, and he had refused his concurrence to the erection,) and must be infeft by the magistrates as the king's subjects. The services exigible are denominated *watching and warding*, the nature of which is sufficiently indicated by the expression. As in England, however, the customs and privileges falling under this kind of holding, are very different in different places, depending partly upon immemorial usage, and partly on the particular constitution or act of the borough. But in none of them are the individual proprietors, as in the burgage-holding boroughs of England, allowed a direct vote in the election of their representatives in parliament, the highest privilege of that nature enjoyed by any of them being a vote in the election of their magistrates, who, in the case of royal boroughs, appoint the delegates who elect the representative for any particular district of boroughs. — One dictum of law, common to all royal boroughs, is, that the widow is entirely excluded from her terce, or third of the rents, of her deceased husband's burgage tenements; a curious contrast to the usage of some English boroughs, where, as above noticed, custom has fixed the opposite extreme, of endowing the widow in the whole of the husband's burgage rents. See Blackst. Com. lib. ii. cap. 6.; Bankl. and Brsk. Inst. &c. (1. m.)

BURGER, GODFREY AUGUSTUS, a popular German poet, and well known in this country as the author of the celebrated ballad of Léonora, was born at Wolmerswende, in the principality of Halberstadt, on the 1st of January 1748. In his infancy, as he himself informs us, he displayed no uncommon indications of superior genius; but was, on the contrary, considered by his parents, as remarkable only for stupidity and indolence. The first ten years of his life were employed in learning to read and write his native language; the Bible and book of church hymns were his principal and favourite study; and his memory being naturally retentive, he easily remembered what he read from these volumes. From the prophetic books of the Old Testament, and the volume of hymns already mentioned, he caught the first glow of poetical inspiration; and to the latest period of his life, he recollected, and mentioned with emotion, the enthusiasm to which they had elevated his youthful mind.

Even so early as the expiration of his first decennium, Burger exhibited that symptom of a poetical disposition—the love of solitude; and without any external encouragement, or other learning, than that with which his hitherto very limited range of reading had supplied him, he began to write verses before he had been taught so much as the first prin

---

VOL. V. PART I.
principles of grammar and composition. His studies, in the mean time, proceeded but slowly; and the difficulty with which he was made to acquire a knowledge of the rules of Latin grammar appears extraordinary in a youth certainly of no mean talents. His father, a plain, sensible man, of some learning and great indolence, having in vain attempted to make his son comprehend the elements of that language, at length resolved to send him, in his 12th year, to his grandfather at Aschersleben, in order that he might have the advantage of attending the grammar school in that town. Here young Burger made some progress in Latin; but having, unfortunately, incurred the displeasure of the rector, in consequence of some satirical verses which he had composed in ridicule of one of his fellow pupils, his grandfather found it necessary to remove him to the pedagogium at Halle, in the year 1762. In 1764, he entered into the university of Halle, and became, at his grandfather’s desire, although contrary to his own inclination, a student of divinity. He is even said to have preached once in a country church in the neighbourhood of Halle. Theological studies, however, were not congenial with the lively disposition of Burger; and his grandfather having got information, that the young man did not conduct himself in a manner suitable to his future vocation, recalled him from Halle. But Burger, it would seem, contrived to appease the anger of his offended relative; for he obtained his permission, not only to repair to Gottingen, at Easter 1768, but to change his studies from theology to jurisprudence. At Gottingen, accordingly, he applied himself, for some time, with assiduity to his new course of study, and made considerable progress in acquiring a knowledge of the principles of the civil law; but the influence of his former dissipated habits became again apparent; and his grandfather having been informed of his manner of living, gradually withdrew from him his countenance and support, and appears to have regarded him as a depraved youth, whose case was entirely hopeless.

Meanwhile, however, Burger became associated with several men of genius at Gottingen, by whose generous assistance he was enabled to continue his studies, which were now principally directed to ancient and modern literature, and especially to poetry. During this period, he composed several of his songs and smaller pieces. In the year 1770, he contributed, along with his friends, Gotter and Bois, to the contents of the first poetical almanack which appeared in Germany; a species of publication, the idea of which was borrowed from the French. About this time, too, he composed his Ode to Hope, and his translation of the Pervigilium Veneris, an undertaking which he appears to have long meditated, and upon the execution of which he seems to have dwelt with feelings of peculiar gratification.

Being now well known and esteemed as a poet in Gottingen, Burger had an opportunity of cultivating his genius in the society of a number of young men of distinguished merit, then residing at the same university, several of whom afterwards made a conspicuous figure on the literary theatre of Germany. Among these may be mentioned the poets, Voss, Holty, and the two Count’s Stolberg. To these friends he communicated most of his pieces before their publication, and was, no doubt, indebted to them for many useful hints and emendations. In the year 1772, he obtained, through the interest of his friends, the situation of an officer of justice (amtmann) in the territory of Alten-Gleichen, in the neighbourhood of Gottingen. In 1774, he married his first wife, a daughter of the Hanoverian law officer, Leenhart, at Niedek. The place which had been procured for him, however, was neither of sufficient emolument, nor sufficiently congenial with the dispositions and habits of the poet, to afford him much or permanent gratification; he therefore resigned it in 1784 in disgust, and in the following year returned to Gottingen.

During the period of his residence in the country, he composed his famous ballad of Leonora, and translated several of the books of Homer’s Iliad into iambic blank verse, which were published in the German Museum. Neither this translation, however, nor one which he afterwards attempted in hexameter verse, was ever completed; nor is it much to be regretted, that he should have relinquished a task, which was afterwards so well performed by Count Frederick Stolberg, and by Voss. In 1778, he undertook the sole superintendence of the Gottingen poetical almanack; the former editor, Goeringk, having associated himself with Voss, in the management of a similar publication at Hamburgh. In the same year, he also published the first collection of his poems, which contained several new pieces, in addition to those which had already appeared in different periodical works.

On his return to Gottingen, in 1784, our author, whose pecuniary circumstances were far from being in a prosperous state, determined to devote himself entirely to his favourite literary pursuits, and to endeavour to qualify himself for the situation of a professor in the university. With this object in view, he began to read lectures on philosophy and the belles lettres, and to give private instruction to individual students. In the following year (1785), he married the youngest sister of his former wife, who had been carried off by consumption about twelve months before; a step which exposed him to much censure on the score of morality, but which appears to have been to himself a source of great comfort and happiness. But his happiness was of short duration; for his beloved partner, in whom his whole affections seem to have been centred, died of a hectic fever a few months after the celebration of the marriage. The blow fell heavily upon Burger; and, indeed, from this period, his life exhibits little else than a record of uninterrupted bodily and mental distress. The animal spirits, which had hitherto supported him through poverty, and privations of different kinds, seem now to have almost entirely forsaken him; and the stream of life, which had previously flowed along with a brisk, if not an equable current, now became flaggy, and mingled with the muddy waters of melancholy and affliction. For some time, he devoted himself to the study of the works of the phi-
Joseph of Koningsberg, and read public lectures on the critical philosophy. Strong, however, as was the desire which he constantly manifested to excel as a teacher of philosophy, the infirm state of his health would not permit him to bestow that intense application upon those pursuits, which their nature necessarily required; and his exertions in this field of discipline, therefore, do not appear to have been attended with any remarkable success.

In the year 1787, his health derived some benefit from medicine; and he had the satisfaction of at length obtaining from the philosophical faculty the degree of doctor. Two years afterwards, he was appointed an extraordinary professor of philosophy, though without any salary; and, in the same year, he published the second edition of his poems, which comprehended, in addition to the contents of the previous edition, his Hohes Lied, which he appears to have considered as his best and most finished production,—two poems in commemoration of the fiftieth anniversary of the foundation of the university of Gottingen, and several other pieces.

In 1790, Burger most unadvisedly entered into a third marriage with a Swabian girl, after a poetical courtship, in which the first advances were made by the lady. The marriage proved a most unhappy one, and was attended with consequences which it is believed contributed to shorten the existence of the poet.

In 1792, he was judicially divorced from his wife, after having suffered a great deal of misery during the latter period of the subsistence of the union. A short while before the separation, Burger had caught a cold, which produced a hoarseness that adhered to him during the remainder of his life, and deprived him of the faculty of speaking in public. His situation now became truly deplorable. Without any certain means of subsistence, he was compelled to earn a scanty and precarious livelihood, by translating out of foreign languages for the booksellers. Meanwhile, his strength rapidly declined. In the month of October 1798, he was forced, by a feverish complaint, to confine himself to bed. Symptoms of consumption ensued; and, after a painful and lingering illness, which he bore with becoming fortitude, he expired on the 8th of June 1794, in the 47th year of his age. A small monument was erected to his memory in Ulric's garden at Gottingen, a spot which the poet was in the habit of frequenting at early hours, and which is now used as a public promenade and place of amusement.

The moral character of Burger was far from being a model of purity: yet, if his failings must be allowed to have been numerous, his acknowledged virtues may perhaps be allowed to soften the tone of rigorous censure. His friends have borne ample testimony to the benevolence, disinterestedness, and liberality of sentiment, which uniformly distinguished him; and have recorded instances of generosity and truly Christian charity, which do him infinite honour. An uncommon vivacity of feeling, and a want of steady principle in the general conduct of life, appear to have constituted the defective part of his character; and while the former frequently hurried him into errors, which reason must have acknowledged and reprobated; the latter removed every obstacle to the impetuosity of passion. An indolent and irresolute mind, unable to resist the seductive allurements that are presented to the senses, produced a life which was too much marked by irregularity and dissipation; and actions which will not stand a trial, according to the strict tests of religion and of virtue.

Upon the poetical character and merits of Burger, we can dwell with more unmixed pleasure. Although all of his numerous productions will by no means satisfy the rigorous demands of taste and critic; yet there will be found, in general, throughout his works, a spirit of originality, a copiousness of poetical imagery, an energy and fire of language, and a harmony of versification, which indicate the offspring of no ordinary genius. Of these excellencies, his Persigilium Veneris, his Ode to Hope, his Hohes Lied, the two poems on the fiftieth anniversary of the foundation of the University of Gottingen, and others, afford abundant examples. His defects, which, however, are more than compensated by his acknowledged beauties, may partly ascribable to the peculiarities of his genius, and partly flow, as a necessary consequence, from the system he professed and pursued, in regard to poetical composition. He possessed more vigour and originality, than chasteness and disciplined thought; more boldness and luxuriacy of imagination, than correctness of judgment or refinement of taste. Like some writers of poetry in our own country, he avowedly looked upon popularity as, at once, the greatest proof of literary merit, and the highest reward of poetical exertion; and not that species of popularity which is conferred upon an author by the suffrages of the truly learned and discerning, but that which is acquired by condescending to adopt the feelings and prejudices, and even the very language, of the illiterate and the vulgar. To this erroneous system he too frequently sacrifices the rules of art, and the feelings of propriety, and gives to his effusions an occasional coarseness, which is apt to offend a critical and refined reader. Some of his sonnets and smaller pieces, too, however beautiful in diction and versification, betray too much of the individual character, sensations, and sufferings of the author: They not only exhibit pictures of individual and peculiar dispositions and emotions of the mind, but are, in fact, the offspring of these peculiar and temporary feelings; feelings too minute and particular to be fully comprehended and enjoyed by the reader, and often too violent to permit a free exercise of the poet's powers.

In one species of poetical composition, however, Burger has few rivals. His ballads, whether original or imitated, exhibit a richness in all the different essential qualities of that kind of writing, which has seldom been equalled, and perhaps never surpassed. In simplicity, energy, pathos, and humour, according to the nature of his subject, he always displays powers as excellent as they are various. His attention had been drawn, at an early stage of his literary career, to Percy's "Relicks," a collection which he perused with delight, and of which he translated some of the contents. Several of his ballads, how-
BURGESS, in a general sense, denotes an inhabitant of a borough; but in a more restrained and proper meaning, it signifies the *freemen* only of the borough, or those who, by fine, parentage from a freeman, marriage with a freeman's daughter, or gratuitous favour of the borough, are entitled to certain privileges of trade or otherwise. It appears from the *Leges Burgorum*, that in the royal boroughs of Scotland, property to the extent of at least a rood of land, holding of the crown, and burdened with the service called *burgagium*, was at length a requisite qualification towards becoming a burgess. It appears, too, from the records in the reign of Robert II. and James I., that, of old, the individual proprietors of tenements in these boroughs had charters from the king, as other freetholders, from which the practice of magistrates receiving vassals in burgal tenements as the king's bailies, has no doubt arisen.

That part of the representatives in parliament who are returned by the boroughs, are also sometimes denominated *burgesses*, in contradistinction to the *burglary*, knights of the shires, or county representatives, although, in fact, they are also generally proprietors of county lands. (s. n.)

BURGLARY (*Burgi latrocinium*) or nocturnal house-breaking, in law, signifies an unlawful entering into the dwelling-house of another, in the night-time, with the intention of committing some felony.

In burglary there are four things to be considered: the time, the place, the manner, and the intent.

1. The time must be night; for the like offence committed by day is called *house-breaking*, to distinguish it from burglary, which is committed by night. Antiquely, the day was reckoned to begin only at sun-rising, and to end immediately at sunset; but the better opinion seems to be, that if there be day-light enough, begun or left, to enable one to discern a man's face, it is no burglary. But this principle does not extend to moon-light.

2. The place, according to Sir Edward Coke, must be a *mansion-house*; and, therefore, to account for the reason why breaking into a church is burglary, he quaintly observes, that it is *domus mansionis Dei*. But it does not seem absolutely necessary that it should, in all cases, be a mansion house; for a burglary may be committed by breaking the gates or walls of a town by night. According to Spelman's definition, burglary is "*nocturna dirupit aliquus habitualem, vel ecclesiae, etiam muralium portarum burgi, ad feloniam perpetrandam*." And we may, therefore, conclude, that the requisite of its being *domus mansionis* is only in the burglary of a private house. No distant barn, however, warehouse, or the like, are under the same privileges as a man's dwelling-house; nor empty houses, wherein no one resides. But burglary may be committed in a house where a man sometimes resides, and which the owner hath left for a short time, *animo revertendi*; although no one should happen to be in it at the period of committing the crime. A burglary may also be committed in the barn, stable, or warehouse, if they be parcel of the mansion-house, though not under the same roof, or contiguous. A chamber in a college or inn of court, where one usually lodges, is to all intents and purposes the mansion-house of the owner; for every inhabitant hath a distinct property therein. So also is a room or lodging, in any private house, the mansion-house, for the time being, of the lodger, if the owner do not himself live in the house, or if he and the lodger enter by separate outward doors; otherwise, however, lodgers are considered only as inmates, and their chambers as parcel of the dwelling-house of the owner. The house of a corporation is their mansion-house, and not that of the respective officers who may inhabit its separate apartments. A shop hired for the purposes of work or trade, and not used as a dwelling, is not considered as a mansion-house, nor can a burglary be committed therein. Neither can burglary be committed in a tent or booth erected in a market or fair, even although the owner should lodge in it. The entering into the work-shops of the plate-glass manufactory, with intent to steal the stock or utensils, is made single felony, and punished with transportation for seven years, by 13 Geo. III. c. 38.
BURGOS, a city of Spain, and capital of Old Castile, is situated on the declivity of a hill, on the right bank of the river Arlanzon, whose stream flows close to its walls. It is supposed by some writers to be the Braun or Bravum of Ptolemy, but others refer its origin to the site of another city called Aura, as late as the ninth or tenth century. It is a large irregular town, presenting the figure of a cross, surrounded by high walls, and was formerly protected by a castle of considerable strength, erected on the brow of the adjacent hill, of some vestiges still remain. The streets are narrow, crooked, and badly arranged; and of its numerous squares, one only is deserving of notice. It stands in the middle of the city, and is surrounded by a piazza, supported by lofty pillars, over which are some tolerably handsome houses. The principal approach to the city is by the gate of Santa Maria, which opens on one of the bridges over the Arlanzon. This gate was built to commemorate the founders of the Castilian monarchy, and the illustrious men who had contributed to its honour and aggrandizement, with whose statues it is still adorned. Among these are Fernando Gonzalez, Charles I., the Cid, and Diego Porcel. The suburbs of Burgos, which are called De Bega, lie on the opposite side of the river, which is crossed by three free-stone bridges. Here is a beautiful promenade, enlivened by the intermix-}

BURGLARY. 9. With regard to the manner of committing burglary, there must be both a breaking and an entry to complete the offence. But it is not necessary that they should both take place at the same time; for if a breach be made one night, and the same breakers enter through it the next night, they are burglars. In general, there must be an actual, and not merely an ideal breaking; such, at least, as breaking or taking out the glass, or otherwise opening a window; picking a lock, or opening it with a key; lifting up the latch, or unloosing any other fastenings of a door. But if doors or windows are negligently left open, and a man enters, it is no burglary, unless he afterwards unlocks an inner or chamber door. To come down a chimney is held to be a burglary. If a man enters by an open door, and breaks o'en a chest, it is no burglary; but it is so, if he breaks open a cupboard or other fixture. If a person knocks at a door, and upon its being opened, rushes in, with a felonious intent; or, under pretence of taking lodgings, falls upon the landlord and robs him; or procures a constable to gain admissioit, in order to search for traitors, and then binds the constable and robs the house: all these are deemed burglary. In cases, although there be no actual breaking. So, likewise, if a servant opens and enters his master's chamber-door with a felonious design; or if a person lodging in the same house or inn, opens and enters another's door with an evil intent. If a servant conspires with a robber, and lets him into his master's house by night, both are implicated in the crime. The least degree of entry with any part of the body is sufficient to constitute a burglary; such as stepping over the threshold, putting a hand or a hook in at a window to draw out goods, or a pistol to demand one's money. The entry may be before the breaking as well as after it; for by statute 12 Ann. c. 7. if a person enters the dwelling-house of another, by day or night, without breaking in, with intent to commit felony, or being in the house, shall commit felony, and then break out by night; this is declared to be burglary. When several persons come together, with a design to commit burglary, and one does it, while the others watch near the house, the act of one is considered as the act of all.

4. The breaking and entering must be made with a felonious intent, otherwise the offence amounts only to a trespass. It is the same thing, however, whether the intention be actually carried into execution, or only demonstrated by some overt act.

BURGLARY is a felony at common law, but within the benefit of clergy. By the statutes 1 Edw. VI. c. 12. and 18 Eliz. c. 7. however, clergy is taken away from the principals; and by 3 and 4 William and Mary c. 9. from all accesses before the fact. By the statute 10 and 11 William III. c. 23. any person who shall convict a burglar shall be exempted from parish and ward offices where the offence was committed. To this exemption a reward of £40 is superadded by the statutes 2 Ann. c. 51. and 6 Geo. I. c. 23. If an accomplice, being out of prison, shall convict two or more offenders, he is entitled to a pardon of the felonies enumerated in the act. And by the statutes 25 Geo. II. c. 36. 27 Geo. II. c. 3. and 18 Geo. III. c. 19. the charges of prosecuting and convicing a burglar shall be paid by the treasurer of the county where the burglary was committed, to the prosecutor and poor witnesses. The statute 23 Geo. III. c. 88. enacted, that any person who shall be apprehended, having upon him any pick-lock key, &c. or other implement, with intent to commit a burglary, shall be deemed a rogue and a vagabond within the statute 17 Geo. II. c. 5. And by the statute 10 Geo. III. c. 48. the buyers and receivers of jewels, gold, or silver plate, carried off in a burglary, may be tried and transported for fourteen years, before the conviction of the principal. Blackst. Comment. B. iv. ch. 16. Jacob's Law Dict. (z)
Burgos, Burgundy.

It is an exact outline of the human figure, and is covered from the waist to the feet with a kind of petticoat, full plaited, and of the finest cloth. It is concealed behind three curtains, and is only exhibited on great occasions, and always with pompous solemnity. There are also several handsome convenants and hospitals, particularly the monastery of las Huelgas, and the royal hospital, which is richly endowed, and remarkable for its cleanliness and healthy situation.

Burgos has a college for the education of youth, and also an academy for the polite arts, both of which are exclusively supported by the merchants.

A surgical school was instituted here in 1800; but, unfortunately, its professors were chosen without any regard to their character and abilities.

This city was erected into an archbishopric in 1574. Its diocese comprehends a cathedral chapter, six collegiate chapters, eight archpriests, and sixty and ninety-three parishes. The cathedral chapter includes 17 dignitaries, 50 canons, 26 prebendaries, and 19 chaplains. Burgos is the residence of the intendant for the province of the same name, and has also a corregidor, and an alcaide.

As long as Burgos was animated by the presence of its sovereign, it continued to enjoy splendour and pre-eminence; commerce flourished, industry was excited, and manufactures were multiplied. Its crowded fairs displayed wealth and prosperity; and it was the entrepot of all the trade that was carried on from the interior of Spain with the several ports on the bay of Biscay. It was also the residence of many foreign merchants; and the famous Segovian cloth was transmitted from this city to every quarter of Europe. But, when Charles V. transferred the seat of royalty, in the beginning of the 17th century, to Madrid, its prosperity began rapidly to decline; and, before the conclusion of a century, it was impoverished and depopulated. Of its 40,000 inhabitants, scarcely 9000 remain. A little cloth, and some fine woolen stockings, called bas d'etain, are its principal manufactures; and its only trade consists in the exportation of the woolen cloths of Old Castile, from which it derives a considerable profit. It is 112 miles north of Madrid. West longitude 3° 38'.

Burgundy, or Bourgogne, was first established by the Burgundians, a German nation, in the beginning of the 5th century. This people formerly occupied the countries of the present Thuringia and Lusace, on either side of the Elbe, and were supposed to have been descended from the Roman soldiers who had been left to garrison the conquests of Drusus; though Pliny decidedly asserts, that they were a tribe of the Vandals. ("Vindilli, quorum pars Burgundiones," Hist. Nat. iv, 28.) Before their emigration from the shores of the Baltic, they were engaged in almost constant hostilities with the Alamanni, concerning their respective boundaries; and it was in conjunction with that nation that they made their first appearance on the Rhine, in the reign of the emperor Tacitus. After repeated irruptions in the empire, they at last obtained a grant from the usurper Jovinus, to settle in that part of Gaul which borders on the Rhine, under their king Gundimar, in 415; and this grant was afterwards confirmed by the emperor Honorius, upon condition that they should assist the Romans, and serve in his armies as subjects of the empire. Their irruptions, however, were continued; and, leaguing themselves with the other barbarians from the north, they entered Belge Gaul, committing unparalleled ravages wherever they came. But their army was at last completely defeated by Attius the Roman general, when they were compelled to sue for peace. Attius afterwards removed them into Sabaudia, now Savoy, an extensive tract between the Rhone and the Alps; and here, they gradually dilated their boundaries until 490, when the territory of Gundobald, the Burgundian king, comprehended modern Burgundy, almost the whole of Switzerland and Dauphine, with a part of Provence and Savoy, and had Vienna for its capital. This monarch had sacrificed to his fears of a rival, two of his brothers, one of whom was the father of Clotildis, queen of the Franks; but had permitted the youngest to live, and to possess the dependent principality of Geneva. The prosperity of the Burgundians, however, was but of short duration. Clovis, king of the Franks, had spread his conquests over the finest provinces of Gaul, and was stopped only by the power and the valour of Gundobald. But the defection of Godgeseil, the brother of the Burgundian king, decided the fate of his country; and Gundobald was compelled to yield to the arms of Clovis, and condescended to pay a yearly tribute to his conqueror. Upon the death of Gundobald in 509, his son, Sigismund, ascended the throne. The first act of his reign was to acknowledge his subject to the Emperor of Constantinople; and the second, that is worth recording, was the inhuman murder of his innocent son, to satisfy the pride and resentment of a step-mother. This he afterwards attempted to expiate, by austere devotion, and liberal donations to the monastery of St. Maurice in Vailais, which obtained for him the honours of a saint and a martyr. But a more dreadful expiation awaited him from the sons of Clovis, who, with a powerful army of Franks, came to revenge upon the son of Gundobald the murder of their grandfather. After an unsuccessful battle in 523, Sigismund fled to the desert, and attempted to conceal himself, under the habit of a monk; but, being discovered and betrayed by his own subjects, he was condemned, with his wife and two children, to be buried alive in a deep well at Orleans. The Burgundians submitted for a short while to their invaders, when, revolting under Gondemar, the brother of Sigismund, they recovered their independence after a severe struggle, but maintained it only for eight years. The sons of Clovis again entered Burgundy; and, in 534, completed the conquest of the kingdom, when Gondemar was obliged to save himself by flight; and his subjects were reduced to pay an annual tribute, and to serve in the armies of their conquerors. But, though now under the dominion of the Franks, they continued to enjoy their national laws, until the reign of Louis-le-Debon.
BURGUNDIENNAIRE, in the beginning of the ninth century, when they were incorporated with the other subjects of the French monarchy.

Upon the death of Charles the Bald, in 879, Burgundy was dismembered of the greatest part of its territories. Burgundia cis-Jurana, or that part of it west of mount Jura (now St. Claud), was added to the kingdom of Provence, which had been given to Boson, the brother-in-law of Charles; and Burgundia tras Jurana, which comprehended Switzerland, the Valais, the Genevèse and Chablais, was given to Rodolph, the son of Conrad, Earl of Paris, in 888. What remained of the ancient kingdom of Burgundy was converted into a duchy, and continued subject to its own dukes, until it was finally united to the crown of France by Louis XI. in 1478. Its history during that period, however, is so completely involved in that of France, that we must refer our readers to that article. At present, we shall only remark, that the dukes of Burgundy, by their various and extensive possessions, were regarded at one time as the most considerable princes in Europe. Many of them rose to the throne of France. They were named, by a decree of Bayle in 1493, the first dukes of the Christian world, and held the next rank to kings.

The province of Burgundy, before the revolution, extended 45 leagues in length, and about 30 in breadth, and was bounded by Champagne on the north, by Franche-Comté on the east, by Lyonnais on the south, and on the west by Bourbonnais and Nivernais. It is divided by a chain of mountains, extending from Dijon to Lyons; on the east of which is one extensive and fertile plain, terminated by the mountains of Franche-Comté and Savoy; but on the west, the country is rather hilly, and in many places dry and uncultivated. The soil throughout the province, however, is in general excellent, but so varied, that almost every district is adapted for a particular species of cultivation. It produces various kinds of grain and fruits, tobacco, hemp, and flax. The wool which is annually derived from their flocks, amounts to between three and four thousand pounds, two thirds of which is manufactured in the province; and its wine is esteemed among the best in the world, and is drunk throughout all Europe. The produce of its vineyards, in common years, is estimated at 100,000 hogsheads. Those of Mont-Rachet and Romand yield the most esteemed wines; though the wines of Vollenay and Pomard are reckoned the most delicate.

Iron mines are found in almost every district, and supply above 30 forges in the province, from which 60,000 quintals of iron are annually transported to different parts of France. But the expense of land-carriage prevents it from being in general requisition, as the maritime provinces can obtain this metal at a cheaper rate from Sweden. Burgundy has also several coal mines, and abounds with an infinite variety of stones, which are capable of a high polish, and equal in beauty to any marble.

The manufactures of Burgundy are principally confined to woollen stuffs, such as drabs, serges, driggars, and blankets; of which it is computed that from 12 to 13 thousand pieces are annually wrought from the wool of the country. They are, however, chiefly consumed in this and the neighbouring provinces. It has several paper manufactories; and its delf-ware is equal to any in France.

The principal rivers of this province are, the Seine, the Yonne, the Ain, the Saone, the Rhone, the Seille, the Loire, the Arroux, and the Doubs; all of which are navigable. The Canal de Bourgogne joins the Saone and the Seine, by the river Yonne, and extends from Saint Jean de Losne to the village of La Roche near St. Florentin, about 50 leagues in length. Part of it, however, is still unfinished (1812), and the communication is open only as far as Dijon. Another canal, called the Canal de Digoin, or Canal du Centre, unites the Saone and the Loire from Chalon to Dijon. It is about 24 leagues in length, and contains 81 sluices.

The population of Burgundy, according to M. Bouvvallet des Brossea, amounted in 1072,500, allowing 500 for every square league, of which he reckons 1411. The name of Burgundy, by the republican division of the country, was blotted from the map of Europe, and it is now distributed into the departments of the Yonne, the Cote d'Or, the Saone and Loire, and the Ain; which see under their respective names. See also Peuchet Dictionnaire, &c.; Gibbon's "Rom. Emp. vol. vii. p. 274, &c. 12mo.; and Tyonna Almanach du Commerce, 1811. (p)

BURIAL, denotes the act of interring the body of a person deceased.

Although the mode of disposing of the body after death, has varied in different ages and countries, yet devotional feelings, combined with a sense of decency, as well as a regard to health and comfort, seem to have universally pointed out to mankind the propriety, not only of removing out of sight the dead bodies of their fellow-creatures, but of performing this act with certain solemnities, which are considered as a natural tribute of respect from the living to the dead. And as these ceremonies have been generally regarded as religious rites, they have seldom been denied but to persons who had made themselves guilty of some flagrant violation of the laws of God and of nature.

Of the various modes of burial which have prevailed in the world, inhumation, or simple interment, according to the opinion of Cicero, as it is the most natural, appears to have been also the most ancient; Redditar enim terrae corpus, et ita locatum ac situ, quasi operimento matris obiitur. De Leg. ii. 22. The practices of burning dead bodies, of enclosing the remains in urns, embalming, &c. appear to have been of later date, and to have derived their origin from the dread of inhuman treatment after death, from motives of affectionate regard in surviving relatives, or from the pride and vanity of individuals.

In discussing the subject of burial, there are four points particularly deserving of attention: The importance which mankind in general have attached to the act; the ceremonies with which it has been accompanied in different ages, and among different nations; the places set apart for interment; and the laws relative to the practice of burial.

1. From the earliest historical records, it is evident that burial was considered by mankind, in the
Burial.

most ancient times, as an object of the highest importance. In the Old Testament scriptures, we meet with many passages which prove this to have been the case among the Jews; who not only betrayed, at all times, an anxiety with regard to the rites of sepulture, and were extremely careful about the burial of their dead, but considered the deprivation of burial as one of the most disgraceful things which could befall a man. When the Lord foretold to Abraham the afflictions which should come upon his race, he added, as a source of consolation, that he himself should go to his fathers in peace, and should be buried in a good old age. (Gen. xv. 15.) Upon the death of Sarah, his wife, Abraham earnestly besought the sons of Heth, to give him possession of a burying-place; and his request being granted, he purchased of Ephron, the son of Zohar, the field of Machpelah, and the cave which was therein, for four hundred shekels of silver. Abraham, accordingly, buried Sarah in the cave of the field of Machpelah, which afterwards served as a place of interment for his own body, and for those of Isaac and of Jacob. Many other passages occur, in which the duty of sepulture is inculcated, and instances of the discharge of it are recorded. David gives great praise to the men of Jabez-Gilead, for rescuing the bones of their king and prince from the enemy's walls, and committing them to their family vault. (2 Sam. ii. 5.) The scriptures threaten the wicked with being deprived of burial, as if such deprivation were one of the greatest calamities that could befall them. "If a man beget a hundred children, and live many years, so that the days of his years be many, and his soul be not filled with good, and also that he have no burial, I say, that an untimely birth is better than he. (Eccles. vi. 3.) Jeremiah also threatens the kings, priests, and false prophets, who had worshipped idols, that he would have their bones thrown out of their graves, like dung upon the earth. (Jerem. viii. 2.) The same prophet foretold, that Jehoiakim, the wicked king of Judah, as a severe punishment for his guilt, should be buried with the burial of an ass; that he should be cast out of the gates of Jerusalem into the common sewer. (Ibid. xxii. 18, 19.) That good men considered it to be a part of their religious duties to bury their dead, appears from the example of Tobit, who went about burying the dead bodies of his murdered countrymen, at the hazard of his own life.

Similar sentiments with regard to the importance of burial, appear to have prevailed also among the heathen nations of antiquity. Both the historical and the poetical works of the Greeks clearly prove, that even in their most flourishing period of prosperity and civilization, they considered it essential to their happiness to be buried and honoured with certain ceremonies after death. Solon, in his conversation with Cercus, (Herodot. Citio, 30—32,) plainly intimates, that he considered a public funeral,—a magnificent interment, as a source of happiness. More than one of the Greek dramas, and, among these, the most esteemed tragedy of Sophocles, the Antigone, derive their whole interest from a contest about the right of burial. The fate of the twelve Athenian commanders, who suffered death because they had been prevented from recovering and burying the dead bodies of their countrymen, after a naval fight, is well known. The ancient Greeks and Romans, indeed, were strongly persuaded, that their souls would not be admitted into the Elysian fields, till their bodies were committed to the earth; and if it happened that they never obtained the rites of burial, they were supposed to continue in a wandering state, excluded from the mansions of the blest, for a term of one hundred years. Hence the imperious duty, incumbent upon all travellers who should happen to meet with a dead body in their way, to cast dust upon it three times; of which three handfuls, at least, was cast upon the head. He who encountered an unburied body without performing this ceremony, drew upon himself a curse, which no sacrifice could remove. Hence, accordingly, makes the shade of Archytas to beg this service of a passing seaman:

At tu, natio, vaga ne paerce malignus arena
Osibus et cupit infamato
Particulum dare. Sic, quodamque simulat Eurus
Placuit Deus, Venerat.
Pictorum studio, se vultus multaque merces,
Unde paterns, tibi defluat aqua.
At Jove, Neptunique sacri custodi Torent.
Neligit immortals nocturnam
Postmodo tu natis formaliter feras.
Dedita jura vicisque suprema
Te manent ipsum : precibus non iniquus iuventus:
Toque piaculo nulla resvoret.
Quamquam festinans, non est mora longa: tectum
Infecto ter subire curas.

Carm. I. 28.

Herodotus informs us, (Euterp. 90.) that in Egypt, if any person, native or foreigner, was found either destroyed by a crocodile, or drowned in the water, the city nearest which the dead body was discovered was obliged to embalm it, with every mark of respectful attention, and afterwards deposit it in some consecrated place. Isaeus adduces it as a proof of Cleon's not being the son of Asyphylus, that he neither buried him, nor performed his funeral esequies. A law of Athens compelled the burial of a dead body found by accident, and pronounced him impious who refused. Servius on Virgil (Eneid vi. 176.) says, that writers on morals rank the interring of the dead among the first of moral duties. Thus, too, although a priest was contaminated by merely looking on a dead body, yet it was considered the height of impiety to leave it unburied. Some individuals, however, appear to have dissented from this almost universal opinion of the sacred duty of interment. The Cynics seem to have regarded burial with contempt; and Pliny (H. N. 1. vii.) classes the concern manifested about it among the weaknesses of human nature. But the importance attached to it, in the general estimation of mankind, is sufficiently obvious from the facts already mentioned, from the denial of the privilege of interment to persons in particular situations, and from the circumstance of disgrace attending the funerals of some of those to whom it was allowed. Persons killed by lightning were buried apart by themselves, being deemed odious to the gods; those who wasted their patrimony, forfeited the right of being buried in the sepulchres of their fathers; and those who were guilty of suicide, were privately de-
Burial.

Positioned in the earth, without the usual solemnities.—That those sentiments with regard to the importance of burial, have descended, in a great measure unimpaired, to modern times, proves that they are deeply implanted in the human breast; and that, if they belong to the weaknesses of our nature, they are too universally prevalent, and too firmly rooted, to be easily eradicated by the efforts of philosophy.

2. The ceremonies observed in burying the dead have varied in different ages, and among different nations. The two modes of burial chiefly practised by the ancients were cremation and simple interment. Of these, we have already observed, interment, or inhumation, appears to be of earliest date. The custom of burning, however, is probably very ancient; and we have several examples of it in the Old Testament scriptures. Saul, we are informed, was burnt at Jabesh, and his bones afterwards buried; and Asa was burnt in the bed which he had made for himself, filled with sweet odours and divers kinds of spices. But the practice of burning, we are assured, existed neither in Persia, nor in Egypt: The Persians thought it profane to feed a divinity with carcasses; and the Egyptians abhorred it on another account, being fully persuaded that fire was a voracious animal, which devoured whatever it could seize, and which, when satiated, expired with what it had consumed. Among the Greeks and Romans, the practice of cremation prevailed, but not universally. Both Virgil and Ovid mention the custom of burning as being general before the foundation of Rome. (Fast. iv. 853.) Inhumation, however, Cicero observes, (De Leg. ii. 22.) was preferred by Numia, the Cornelian family, and Marius. But cremation seems still to have been generally practised. Tacitus (Ann. xvi. 6.) says, Poppea's corpse was not burnt, according to the Roman fashion; which shews the prevailing custom at that period. And it is a misapprehension of Capitoline's words, to suppose that Antonius prohibited it; for Macrobius, (vii. 7.) who lived during the reign of Theodosius the Younger, speaks of it as being left off only in his time. Among the Hindoos, the practice of burning the dead has prevailed from the remotest times. Several antient authors also mention the unnatural custom of the women in India burning themselves with the bodies of their husbands, which seems to be of great antiquity. Thus Propertius:

Et certamen habent leti quae vicem sequatur
Conjugiam: postor est non licetus mortis.
Ardent victoria, et florum postera pretent,
Imponuntque misa ora perusta viris.

Lib. iii. El. 13.

Cicero, in his Tuscanian questions, likewise mentions the same fact. "The women in India," says he, "when their husband dies, eagerly contend to have it determined which of them he loved best, for each man has several wives. She who conquers deems herself happy, is accompanied by her friends to the funeral pile, where her body is burnt with that of her husband; they who are vanquished depart in sorrow." It is evident, however, that the custom of burning the dead was at one time prevalent among the northern nations of Europe, as well as among the Greeks and Romans, and the inhabitants of Asia. The author of Ynglinga Saga, published by Snorri Sturleson, in his history of the kings of Norway, describes the introduction of this practice to Odin, after his settlement in the north. But he views it, at the same time, as borrowed from the Asiatics. Odin, he says, enforced those laws in his own dominions, which were formerly observed among the inhabitants of Asia. He enjoined that all the dead should be burnt, and that their goods should be brought to the funeral pile with them; promising that all the goods thus burnt should accompany them to Walhalla, and that there they should enjoy what belonged to them on earth. He ordered that the ashes should be thrown into the sea, or be buried in the earth; but that men remarkable for their dignity and virtue should have monuments erected in memory of them; and that those who were distinguished by any great action, should have grave-stones, called Bautasteina. (Yngl. Sag. c. 8.) Sturleson speaks of two distinct ages. The first, he says, was called Brunnbegda (the age of funeral piles,) during which it was customary to burn all the dead, and to erect monuments over them, called Bautasteina. From the time, however, that Danus Mikillati, the great king of the Danes, caused a tomb to be made for him, and gave orders that he should be buried with all the ensigns of royalty; with all his arms, and with a great part of his riches, many of his posterity followed his example. Hence the age of graves (Haugas-alt) had its origin in Denmark. But the age of funeral piles continued long among the Swedes and Normans. (Pref. to Hist. p. 2.) Danus Mikillati was born A. D. 170. A similar distinction of ages appears to have existed among the Norwegians, in ancient times. We find one Atbior, in an address to Hacuin the Good, on occasion of a general convention of the people, dividing the time past into the age of funeral piles, and that of graves. (Saga Hacoar, c. 17.) It is a fact not generally known, that the inhuman custom which prevailed in Hindostan, of burning wives with their dead husbands, was common among the northern nations. Not only did it exist among the Thracians, the Herulis, the inhabitants of Poland and of Prussia, during their heathen state, but also among the Scandinavians. (Oddo, Vit. Olai Trygguson.) It appears, however, that widows were not burnt alive; but that, according to the custom of the country, they previously put themselves to death. The reason assigned for this horrid law was that their nuptial felicity would thus be continued after death in Walhalla, which was their heaven. (See Bartholin, de Causis Contempt. Mortis, 506—510. Jamieson's Elymolog. Dict. v. Bayle-Pyre.) The introduction of Christianity appears to have put a stop to the practice of burning the dead; and interment came, at length, to be universally adopted by those nations which were converted to the true faith.

We shall now proceed to give some account of the various funeral solemnities which have been practised among different nations, and in different ages of the world, so far as they can be collected from credible authorities.

Among the Jews, all those who happen to be present when any person has just expired, tear their
Burial.

Clothes, according to the ancient custom of the Hebrews. The dead body is then placed on a sheet spread on the pavement, with the thumb turned inward to the hand, and a wax taper burning at the head or feet. The deceased is washed, and a clean shirt put up in him, and over the shirt a garment of fine linen, which he wore on the day of solemn expiation; then his tali, which is a piece of square cloth with tufts. Lastly, a white cap is put on his head, and he is then shut up in the coffin. Anciently, it appears to have been a custom in Palestine, to embalm the bodies of persons of distinction and fortune; but this was never generally practised. After the body has been exposed, the relations meet to accompany it to the ground. In ancient times, they had women hired to cry, and persons who played on doleful instruments, and who walked in procession. Persons who met the funeral procession in civility joined the company, and mingled their groans. At the place of burial, the coffin is set down on the ground; then, if the deceased was a person of rank, some one makes his encomium; after which they walk ten times about the grave, repeating a long prayer, beginning, “God is the rock, his way is perfect,” &c. (Deut. xxxii. 4.) The body is then let down into the grave, with its face turned towards heaven; the nearest relations throw the earth upon it, and the grave is filled. When they depart from the spot, they walk backward, and pulling up some grass three several times, they throw it behind their backs, repeating, “They shall flourish like the grass of the earth.” Ps. lxiii. 16. (See Calmet’s Dict. of the Bible, v. Dead.)

The funeral solemnities of the Greeks seem to have varied, according to the peculiar sentiments and habits of the different states, and the rank and condition of the deceased. In general, the poorer classes were interred in public cemeteries, without any great external pomp or mark of distinction. Persons of fortune, on the other hand, were usually buried with much splendor. Of these, some were burnt to ashes on a magnificent pyre, and their ashes carefully collected and deposited in an ornamented urn; while others were embalmed, after the Egyptian fashion, and then removed to some stone or marble tomb provided for the express purpose.

The Athenians were much more ceremonial than any other people in regard to the burial of their dead. Their funerals were frequently celebrated with the most extravagant pomp; which at one period was carried to such an extreme, that Solon was compelled to introduce and enforce a law for its moderation. Dirges, or funeral songs, often of exquisite beauty, were adapted to music, and not only sung or repeated over the grave or funeral pyre, but afterwards recited, in full band, while funeral games and exercises were performed at the place of sepulture. But this extravagant pageantry, which was conferred upon all who were rich enough to afford it, was greatly exceeded on the death of any distinguished patriot or warrior; on which occasions, the expense incurred, which was generally enormous, was always discharged by the community. Of this extreme probity we have an example in the funeral of Ephorinos; and also in that of Demetrius, which is related at large by Plutarch, in Vit. Demetr. See Mason Good's

Lucretius, b. iii. v. 923, N. But the most magnificent public funeral, perhaps, of which we have any account, was that of Alexander the Great, when his body was brought from Babylon to Alexandria; a minute description of which is given by Diodorus Siculus.

The manner in which the funerals of those who died in defence of their country were solemnized at Athens, is worthy of particular notice, as it cannot fail to afford us an elevated idea of that polished and patriotic people. On a day appointed, the bones of the deceased, contained in a number of coffins made of cypress wood, were placed beneath a large tent erected for the purpose, and exposed to the public view; so that all those who had relations to deplore, might assemble to weep over them, and to perform the duties which tenderness dictated, or religion enjoined. Various sorts of odoriferous herbs and flowers were brought to the spot by the friends of the departed, and strewn around the tent. Three days afterwards, the coffins were placed upon as many cars as there were tribes; with an empty hearse, in memory of those who could not be found. These were carried slowly, in procession, through the town to the Ceramicus, or public place of burial, where funeral games were celebrated in honour of the deceased. The bodies were then committed to the earth, amidst the weeping and lamentation of a numerous train of mourners. An orator, appointed by the republic, pronounced, from an elevated spot, a funeral oration, in praise of his valiant countrymen; and each tribe raised over the graves of its members a column, or monument of some kind, upon which were inscribed the names of the deceased, their age, and the places where they had fallen. See Beloe’s Herodot. vol. ii. p. 65. N.

Some interesting particulars, regarding the funeral ceremonies observed by other ancient nations, have been preserved by Herodotus.

Among the Egyptians, when a man of any consequence died, the females of the family disfigured their faces with dirt, left the corpse in the house, and ran publicly about, accompanied by their female relations, with their garments in disorder, their breasts exposed, and beating themselves severely. The men on their part did the same; after which the body was carried to the embalmers. Certain persons were legally appointed to the exercise of this profession; who treated the body in different modes, according to the rank and fortune of the deceased. Herodot. Enterp. p. 85, 86. For an account of the different methods of embalming and preserving dead bodies, see the article Mummy.

By the ancient Ethiopian practice, which is related by Herodotus according to the traditions of Cambyses’ spies, after all the moisture was extracted from the body, by the Egyptian, or some other process, they covered it entirely with a kind of plaster, which they decorated with various colours, so as to make it resemble as near a resemblance as possible of the person of the deceased. They then inclosed it in a hollow pillar of crystal, which was dug up in great abundance, and of a kind that was easily wrought. The body of the deceased was very conspicuous through the crystal, had no disagreeable smell, nor any
thing else that was offensive. This coffin was kept by the nearest relations of the deceased for a twelve month in their houses, during which period they offered before it different kinds of victuals, and the first fruits of their lands. These were afterwards removed, and set up round the city. *Herodot. Thal.* 24.

The ceremonies observed at the funerals of the Scythian kings were extremely singular. As soon as the king died, a large quadrangular trench was sunk near the spot where the Borysthenes begins to be navigable. The body was then thoroughly cleansed, and embalmed with various aromatic herbs, and enclosed in wax. After being transported through the different provinces of the kingdom, the dead body was at last brought to the Gerrhi, who lived in the remotest parts of Scythia, and amongst whom the sepulchres were. Here the corpse was placed upon a couch, round which daggars were fixed at different distances; and upon the whole were disposed pieces of wood, covered with branches of willow. In some other part of the trench they buried one of the cumbines of the deceased, whom they had previously strangled, together with the baker, the cook, the groom, his most confidential servant, his horses, the choicest of his effects, and some golden goblets. The trench was then filled up with earth, and a mound as high as possible raised above the whole. Such was the mode of burial adopted at the interment of their kings; but among the people, in general, the ceremony was somewhat different. When any one died, the neighbours placed the body in a carriage, and carried it about to the different acquaintances of the deceased. These prepared some entertainment for the persons who accompanied the corpse, placing before the body the same as before the rest. After being carried about, in this manner, for the space of forty days, the corpse was at length buried. The Scythians, however, do not seem to have all observed the same customs with regard to their funerals; for it would appear, that there were some who suspended the dead body from a tree, and left it there to putrefy. "Of what consequenee," says Plutarch, "is it to Theodorus, whether he rots in the earth or upon it? Such, among the Scythians, is the most honourable funeral." This strange custom is also mentioned by Silius Italicus:

At gente in Scythias suascat cadaver truncis.  
Lenta dies sepeliit, putri lingentia tabo.

A similar practice, Captain Cook observes, prevails among the inhabitants of Otaheite, who leave dead bodies to putrefy on the surface of the ground, and then bury the bones. See *Herodot. Melponene.* 71—73. Beloe's *Transl.* vol. ii. p. 243—247. Hawksworth's *Voyages.*

The African Nomades observed, in general, the same ceremonies with the Greeks in the interment of the dead, excepting the Nasamones, who buried the corpse in a sitting attitude; and were particularly careful, when any one approached his end, to prevent his expiring in a reclined posture. *Herodot. Melp.* 190.

The ancient Persians first inclosed their dead bodies in wax, and afterwards placed them in the ground. For a long time, the Magi seem to have retained the exclusive privilege of having their bodies left as a prey to carnivorous animals. But in succeeding times, the Persians abandoned all corpses indiscriminately to birds and beasts of prey; and this custom still in part continues. The burial-place of the Guebres, about half a league from Isphahan, is a round tower made of free-stone, thirty five feet in height, and ninety in diameter, without gate or entrance of any kind, and ascended by a ladder. In the middle of the tower is a sort of trench, into which the bones are thrown. The bodies are ranged along the wall in their proper clothes, upon a small couch, with bottles of wine, &c. The ravens which fill the cemetery devour them. (Chardin's *Travels.* Beloe's *Herodotus.* vol. i. p. 144, N.) An exact model of this curious tower is preserved in the British Museum.

"The funerals of the chief men among the ancient Thracians were performed in the following manner. For the space of three days the body of the deceased was publicly exposed; then, after sacrificing animals of every description, and uttering many and loud lamentations, they celebrated a feast, and the body was finally either buried or burned. A mound of earth was afterwards raised upon the spot, and games of various kinds were celebrated, in which each particular contest had a suitable reward assigned it. *Herodot. Terps.* 8.

Among the Romans, the dead body was bathed with warm water, anointed with perfumes, and then dressed in the best robe which the deceased had worn when alive; ordinary citizens in a white toga, and magistrates in their praetexta, &c. In this state the corpse was placed on a couch in the vestibule, with the feet outwards, as if about to take its last departure. A lamentation was then made over the body, and the couch was sometimes decked with leaves and flowers, as in the case of Pallas, mentioned by Virgil, *Aenid.* 64—66. If the deceased had obtained a crown for his bravery, it was now put upon his head. A small coin (trium vel obolus) was put in his mouth, which he might give to Charon for his freight; for, without this, it was thought that souls could not purchase a lodging, or piece of rest. The body was afterwards either buried or burnt.

The Roman funerals were either public or private; and these, again, consisted of several different kinds. When a public funeral was intended, the corpse was usually preserved for seven or eight days, with a keeper to watch it. In the case of a private funeral, the body was not kept so long. On the day of the funeral, when the people were assembled, the dead body was carried out, with the feet foremost, on a couch, which was covered with rich cloth, decorated with gold and purple, and generally supported on the shoulders of the nearest relations of the deceased, of his heirs, or his freedmen, and sometimes of persons of rank. Anciently, all funerals were celebrated at night, with torches; but, afterwards, public funerals were solemnized at an early hour of the day. Private funerals, however, always took place at night. The order of the funeral procession was regulated by a person called *designator,* attended by lictors, dressed in black. First went musicians of various kinds; then mourning women, hired to lament and to sing the funeral song, or the praises of the deceased, to the sound of the flute. The num-
Burial.

Burial.

When the body was not burnt, it was put into a coffin, usually made of stone, which was laid in the tomb on its back. Some time after the funeral, the family were occupied with the ceremonies of mourning and purification. Oblations, or sacrifices to the dead, were afterwards performed. The sepulchre was then bespread with flowers, and covered with crowns and fillets; and before it there was a little altar, on which libations were made, and incense burnt. A keeper was appointed to watch the tomb, which was frequently illuminated with lamps.

At the funerals of the emperors, and other illustrious persons, who were deified after death, the real body was burnt, and the remains buried in the usual manner. But a waxen image of the deceased was made to the life, which, after a variety of ridiculous ceremonies, was carried on a couch in solemn procession on the shoulders of young men of equestrian rank, first to the forum, where the dirge was sung by a choir of boys and girls of the most noble descent; then to the campus martius, where it was burnt, with a vast quantity of the richest perfumes, on a lofty and magnificent pile; from the top of which, an eagle let loose, was supposed to convey the prince's soul to heaven. See Adams' Roman Antiquities.

A very interesting account of the funeral ceremonies observed among the Hindus, has been given us by Mr Colebrooke, in his ingenious essays "On the Religious Ceremonies of the Hindus, and of the Brahmins especially." (See Essay ii. Asiatic Researches, vol. vii.) A dying man, when no hopes of his surviving remain, should be laid upon a bed of cusa grass, in the open air; his head should be sprinkled with water drawn from the Ganges, and smeared with clay brought from the same river. A Sulagrama stone should be placed near him, holy strains from the Veda, or from sacred poems, repeated aloud in his ears, and leaves of holy basil scattered over his head. When he expires, the body must be washed, perfumed, and decked with wreaths of flowers; a bit of tuttanas, another of gold, a gem of some sort, and a piece of coral, should be put into the mouth of the corpse, and bits of gold in both nostrils, both eyes, and both ears. A cloth, perfumed with fragrant oil, must be thrown over the body, which is then carried, by the nearest relations, to some spot in the forest, or near water. The corpse is carried out by the southern gate of the town, if the deceased were a Sudra; by the western, if a Brahmana; by the northern, if he belonged to the military class; and by the eastern, if he sprung from the mercantile tribe. When the procession has reached its destination, the corpse must be gently laid, with the head towards the south, on a bed of cusa, the tips of which are pointed southward. The sons, or other relations of the deceased, having bathed in their clothes, must next prepare the funeral pile, on a clean spot of earth, after marking lines thereon, to consecrate it. They must afterwards wash the body, meditating on all the holy places on the face of the earth, as well as the four oceans. After being washed, clothed in clean apparel, and rubbed with perfumes, the relations of the deceased place the corpse supine, with its head towards the north, (or resupine, if it be the body of a woman), on the funeral pile, which is previously decorated with flowers. A cloth must then be thrown over it, and a relation of the deceased, taking up a lighted brand, after some ceremonies and invocations, applies the fire to the pile, saying, "Namo! Namah!" while the attending priests recite an appropriate prayer. They then walk in procession, according to seniority, to a river or other running water; and, after bathing, present oblations of water from the joined palms of their hands. If it be intended to show particular honour to the deceased, three offerings of water may be thus made. After finishing the usual libations of water, and shifting their wet clothes, they sit down on the soft turf, and recite certain suitable moral sentences. During ten days, funeral cakes, together with libations of water and tila, must be offered as on the first. On the last day of mourning, the nearest kinsman of the deceased gathers his ashes, after offering a straddha singly for him. After ob-
When, however, it is usual to bring the corpse, at mid-day, or afternoon prayers, to one of the mosques, from whence it is accompanied by the greatest part of the congregation to the grave. Their processions, upon these occasions, are not so slow and solemn as in most parts of Christendom; for the whole company make what haste they can, singing, as they go along, some select passages from the Koran. That absolute submission which they pay to the will of God, allows them not to use any consolatory words upon such occasions; no loss or misfortune is to be regretted or complained of; and instead of such expressions of sorrow and condolence, as may regard the deceased, compliments are paid to the person who is the nearest concerned. The cemeteries of the Turks are commonly planted with cypress trees; and for the space of two or three months after any person is interred, the female relations of the deceased go once a week to weep over the grave, and deck it with flowers and green leaves. Shaw's Travels.

A very full account of a Mahometan funeral is given by M. Guys, in his Lettres sur la Grece; and another by a later traveller, Dr Griffiths, in his Travels in Europe, Asia Minor, and Arabia.

The funerals of the Persians are conducted in a manner similar to those in other Mahometan countries. They are, however, strangely superstitious about the burial of their kings. For, fearing lest by some magical art, any enchantments should be practised upon their bodies to the prejudice of their children, they conceal, as much as possible, the real place of interment. For this purpose, they send to different places several coffins of lead, with others of wood, and bury all alike with the same magnificence. In this manner they delude the curiosity of the people, who cannot discern, by the outside, in which of the coffins the real body should be. See Charidin.

The Russians, who profess the religion of the Greek church, entertain many fantastic notions with regard to the state of departed souls; and their funeral ceremonies are therefore attended with some singularities. After the dead body is dressed, a priest is hired to pray for his soul, to purify it with incense, and to sprinkle it with holy water while it remains above ground; which, among the better sort of people, it generally does for the space of eight or ten days. When the body is carried to the grave, which is done with many gesticulations of sorrow, the priest produces a ticket, signed by the bishop and another clergyman, as the deceased's passport to heaven. When this is put into the coffin, between the fingers of the corpse, the company return to the deceased's house, where they drown their sorrow in intoxica-

tion, which is sometimes prolonged for a considerable period. During that time, a priest says prayers every day over the grave; for though the Russians do not believe in purgatory, yet they imagine that their departed friend may be assisted by prayer in his long journey to the place of his destination after this life.

In Japan, Peru, Pegu, Mexico, Tartary, and Siemens, the dead are burned; and in the case of persons of superior rank and consideration, the fires are made with aromatic woods, gums, balsams, and oils. In China, it is said to have been formerly the custom to bury slaves with the emperors and princes; but this cruel practice has given way, in modern times, to the more innocent one of burning images of their domestics in tin-foil, cut into the shape of human beings, and of placing their statues in wood or stone upon the graves. The last remains of a relation are interred with all the honours which the family can afford. See Barrow's Travels in China.

Among the Hottentots, the dead are interred with very little ceremony. When a Hottentot dies, he is buried in his worst dress, (a sort of mantle made of sheep's or calf's skin,) and the limbs are disposed in such a manner that the whole body is covered. The corpse is then carried by the relations to a certain distance from the horde, and thrust into a pit or hole, dug for the purpose, and then covered over with earth, stones, or brushwood. Such a mausoleum, however, proves but a very weak defence against the attacks of the jackal and hyena, which generally dig up and devour the body. A horrid custom is said to prevail among these savages, of burying children at the breast alive, in case of the mother's death. See Vaillant's Travels; Sparrman's Voyage.

In New South Wales, the dead are burned, afterwards deposited in the ground, and a mound or hilly covered upon the ashes. (Hunter's Voyage.) At Otaheite, none are burned in the Morai but those offered in sacrifice, or slain in battle, or the children of chiefs which have been strangled at the birth; an act of atrocious inhumanity, which is too common among those islanders. When a person of eminence dies, the body is preserved, and not buried, unless he died of some contagious or offensive disease. The following is understood to be the method in which this preservation is effected. Soon after death, the body is disembowelled, and the cavity is then filled or stuffed with cloth. When any moisture appears on the skin, it is carefully dried up, and the body afterwards rubbed all over with a large quantity of perfumed oil; which being frequently repeated, preserves it a great many months; but, at last, it gradually moulds away. The relations and friends, who are absent, perform their part of the funeral rites at their arrival; each female presenting a piece of cloth to the corpse; and they continue to dress and decorate the body, as if still alive, and to furnish it with provisions, supposing that the soul which hovered round receives satisfaction from such marks of attention. See Cook's Voyages.

Among the ancient Britons, both cremation and interment were practised, as druidical rites. When a dead body was interred, it was usual to bury along with it whatever was of use in this life, under the
supernatural notion that the deceased would have occasion for it in the other world. Hence, arms and various other utensils are still discovered in old tombs. The practice of raising barrows over the bodies of the deceased, which was almost universal in the earlier ages of the world, prevailed also among the Britons. Beneath these barrows both arms and skeletons are frequently discovered: (See Barlow.) At what precise period the use of coffins was introduced into this country, has not been ascertained; but in its rudest form, the kist-ven, or coffin composed of rough stones set edge-wise at the sides and ends, appears to have been a very ancient receptacle of the dead in Britain. The great improvement of the stone coffin, by forming it of a single stone, with mallet and tool, has been ascribed to the Romans; who appear, however, to have made use of brick coffins, or sarcophagi, in their earliest periods. The practice of cremation ceased upon the introduction of Christianity; and the Britons, after the example of the Romans, had recourse to interment and the use of coffins. See Gough's Sepul. Monum.; Pennant's Tour in Wales; Stukely's Aubery; Archceol. vol. ii.

3. In ancient times, it does not appear that any thing was determined particularly with regard to the place of burying the dead. There were graves in the town and country, upon the highways, in gardens, and on mountains. The tombs of the kings of Judah were in Jerusalem, and in the royal gardens. The sepulchres which Joseph of Arimathea had provided for himself, and wherein he placed our Saviour's body, was in his garden; that of Rachel was upon the highway from Jerusalem to Bethlehem. The kings of Israel had their burying places in Samaria; Samuel and Joab were interred in their own houses; Moses, Aaron, Eleazar, and Joshua, in mountains; King Saul and Deborah under trees; Manasseh and Amon in the garden of Uzza. The sepulchres of the people of Jerusalem are said to have been in the valley of Kidron, where were likewise the burying places for foreigners. See Calmet's Dictionary of the Bible, v. Burial.

Both the Jews and Heathens, usually buried their dead without the city. By a law of the twelve tables, the Romans were prohibited from burying within the city: Hominem mortuam in urbe ne sepelito, nece urito. Cie. De Leg. ii. 29. But a special privilege was sometimes granted by the senate to particular persons, that they might be buried within the walls; as in the case of Julius Caesar, who obtained the right of making a sepulchre for himself within the Pomerium. Other illustrious families likewise possessed the privilege of being interred within the walls; and the vestal virgins were always buried in the city. The burial places among the Romans were either private or public. The former were in fields or gardens, generally near the highway; hence the frequent inscriptions, Siste viator, Aspice viator, &c. on the Via Appia, Aurelia, Flaminia, &c. The public places of interment for great men were commonly in the Campus Martius, or Campus Esquulinus, which were granted by a decree of the senate; and for poor people, without the Esquiline gate, in pits or holes dug perpendicularly, called puteolae. The tombs of the rich were generally built of marble, the ground inclosed with a wall, or iron rail, and planted round with trees. Common sepulchres were usually built below ground, many of which still exist in Italy under the name of catacombs. See Adams' Roman Antiq.

The Greeks, in general, followed the same practice of burying without the city walls. Lycurgus, however, introduced the contrary practice among the Lacedaemonians, with the view, it is said, of rendering the youth of Sparta familiar with the spectacle of death.

The Turks, we are told, bury not at all within the walls of the city, excepting the great Turkish emperors, with their wives and children, and some few other of their great Bassees, and those only in chapels by themselves built for that purpose. All the rest of the Turks are buried in the fields; some of the better sort in tombs of marble; but the rest with tomb-stones laid upon them, or with two great stones, one at the head, and the other at the foot of every grave. The greatest part of these are of white marble brought from the Isle of Marmor. (Knolles' Hist. of the Turks.) They are in the habit of burying by the way-side, believing that passengers will pray for the soul's of the dead: Taverner's Travels.

Among the primitive Christians, burying in cities was not permitted for the first 300 years, nor in churches for many ages afterwards; the bodies of the dead being first deposited in the church-yard, and porches and porticoes of the church. Upon the introduction of Christianity into this country, a regular mode of disposing of dead bodies took place. The people, during worship, were taught to look towards the altar, and the dead were buried with their faces the same way, excepting the priests, who, for a similar reason, were ordered to face the congregation. The reason given by Gregory the Great, for the custom of burying in churches, or in places adjoining to them, was, that the tombs of the dead might recall them to the recollection of their friends and relations, who might thus be led to offer up prayers for them; and this reason was afterwards transferred into the body of the canon law. Hence also the striking and solemn address which distinguished the epitaphs of the monkish ages: Orate pro anima mortuorum. In the eighth century, the people began to be admitted into the church-yards, and some princes and distinguished persons into the church. The practice, first introduced into the Roman church by Gregory the Great, was brought into England by Cuthbert, archbishop of Canterbury, about the year 750; and the custom of erecting vaults in chancels, and under the altars, was commenced by Lanfranc, archbishop of Canterbury, when he had rebuilt the cathedral there, about 1075.

4. By the common law of England, the granting of burial within the church is the exclusive privilege of the incumbent; excepting those cases where a place of burial is prescribed for, as belonging to a manor-house. The church-wardens, however, have by custom a fee for every burial there, because the parish is at the expense of repairing the floor. Watson's Clergyman's Law.

The 68th canon of the church enjoins, that "no minister shall refuse to bury any corpse that is brought to the church, or church-yard, (convenient warning
being given him thereof before,) except the party deceased were denounced excommunicated, majori excommunicatione, for some grievous and notorious crime, and no man able to testify of his repentance."

Anciently, there were other causes of refusal, particularly in the case of heretics, against whom there was an especial provision in the canon law, that if they continued in their heresy, they should not enjoy the privilege of Christian burial; but no instances of its enforcement occur subsequent to the period of the Reformation. Such as had not received the holy sacrament, at least at Easter, were excluded from Christian burial, by a law of the Lateran council, which was afterwards adopted by the English church. But all these and other prohibitions are, at this day, considered as obsolete, and the denial of burial is restrained to the excommunicated, the unbaptized, and suicides.

A case occurred lately in England, in which the denial of burial was attempted to be enforced against dissenters from the established church. The Rev. John Wight Wickes, rector of Wardley-eum-Belton, refused to bury the infant child of two of his parishioners, who were Calvinistic Independents, because it had not received Episcopalian baptism. A suit was brought against this clergyman in the Arches Court of Canterbury, for violating the 65th canon above quoted, in which Sir J. Nicholl, official principal of that court, gave judgment for the plaintiff, chiefly upon the ground, that the church of England had recognised persons, though not baptized in its own forms, yet as validly baptized; and that it could not mean to exclude from burial all persons who have not been baptized according to the forms of its own liturgy, provided the essence of baptism, according to what has been generally received as such among Christians, has taken place; but those only who have not been baptized at all by any form which can be recognized as an initiation,—a legal and valid initiation into the Christian church. This judgment has given rise to some controversy; for the substance and merits of which we must refer our readers to the decision of Sir J. Nicholl, with the reasons for it, published by Mr Gurney; the Respectful Examination of the Judgment; &c. by the Rev. Charles Dani-  

Burke, Edmund, a writer distinguished in morals, criticism, and politics, was born in Dublin on the 1st of January 1728. His father was a reputable attorney, and not a Catholic, as has been sometimes asserted. He was educated in the academy of Shackleton by a quaker at Ballystore, near Carlow, to whom, for 40 years, during his visits to Ireland, the grateful scholar used regularly to pay his respects. In 1746, he was entered at Dublin College, where he pursued a wide and diversified course of studies, chiefly in moral science, and took a bachelor's degree. The story of his studying at St Omer's is denied, apparently on good grounds, by his biographers. We hear, however, nothing farther about him, till he made an unsuccessful attempt for the vacant professorship of logic at the college of Glasgow. Burke, it is said, was passing the old college court gate of that place, when a label affixed to it struck his eye, which had been pasted up as a mere matter of form, inviting all candidates for the professorship to compete, although it was known that a successor was already fixed upon. Whether Burke made a public competition by the old syllogistic mode, or was at all a competitor in form, we know not. In 1758, he came to London, and fixed as a student of law; and for some time, there is every reason to believe, supported himself by writing for newspapers and magazines. Yet, though hitherto comparatively obscure, he found his way to polite society, distinguished himself wherever he was known by the charms of his conversation, and was so far a man of pleasure, as to be supposed to be on intimate terms of friendship with Mrs Woffington, the actress, whose elegance of manners was to him, like that of Aspasia to Socrates, and contributed a polish to the solid materials of his mind. A decline of his health made him the guest of his friend Dr Nugent, which eventually occasioned his marriage with the daughter of that able physician.

His first avowed work appeared in 1756, A Vindic-  

ation of Natural Society, or a view of the miseries and evils arising to mankind from every species of artificial society; in a letter to Lord **, by a late noble writer. The noble writer meant to be supposed was Lord Bollingbrooke. Whether Mr Burke's real intention in this work was to represent the worst errors of human institutions, or ironically to show the weakness of Bollingbrooke's arguments against religion founded on its abuses, by pointing the same inconclusive arguments against civil institutions, we know not; but his work attracted, at its first appearance, very little interest. The reception of his Essay on the Sublime and Beautiful, in 1757, was much more flattering; and has since preserved his name among the highest writers on the philosophy of taste; although the errors of much of his system have been since sufficiently refuted. The fame of this work is said to have procured him the acquaintance of Reynolds and Johnson. Such, however, was the force of Burke's mind in conversation, and such was his promptitude in bringing it to bear on all present points, that we doubt if his introduction to the highest literary circle of his time was owing to his writings. A man who could not be conversed with, (as Johnson said,) while you took shelter with him from a shower under a gateway, without perceiving that he was an extraordinary genius, such a man required no treatises to introduce him in any circle. In 1758, he proposed to Dodsley the bookseller, the plan of the Annual Register. He wrote much of the historical part of that work: the general air of which has a candour and a diffuse dignity resembling the unpremeditated effusions of such a mind as his. His political career may be said to have commenced in 1761, when going
over as confidential friend to Mr (Single Speech) Hamilton, secretary to the Lord Lieutenant Lord Halifax; He is supposed to have rendered some service to the ministry, for which they rewarded him with a pension of £300 a year on the Irish establishment. Soon after his return to London, he was introduced to Lord Rockingham, who made him his private secretary, gave him a loan, or rather a present, of several thousand pounds, and by his personal kindness and congenial patriotism, gave a colour to the politics of Burke, which they retained with few variations during life. He was, indeed, at different periods, both a democrat and an aristocrat; but he combined, during the greater part of his life, a certain visible connection between the apparently incongruous qualities of those distinctions. He loved the liberty of England, but he wished the moving power of the government to centre in the great families. These were the politics of Rockingham. Burke stood up for America against the claim of taxation; but he wished to wave the question of abstract right.

—This was the practice of Rockingham. By Lord Rockingham's bounty, he was enabled to purchase his seat at Beaconsfield; by the interest of his patron, he also got into parliament. His first speech excited uncommon sensation; more admiration, perhaps, of his eloquence than of his logic; but when superior powers of imagination are displayed, the mass of mankind look sanguinely for the further evolution of practical and solid talents. Burke now partakes the blame of what are called the indecisive measures of the Rockingham cabinet with respect to America; but he shared at the time in the popularity of the repeal of the cyder and warrant acts.

The administration of Lord Rockingham was short, and Burke concluded his official labours by a forcible and (considering the style of his eloquence) a simple work, entitled, A short account of a late short Administration. After which he took his station among the determined opposers of ministry, and the regular censurers of their proceedings. In his next political work, his Thoughts on the Causes of the present Discontents, while he asserts the most popular principles of the constitution, he reverts to a practical remedy, which attests his leaning to aristocracy; for the sum of his arguments is, that the government ought to be placed in the hands of the great Whig families, who had been favourers of the Revolution, and of its consequent measures. The same gist of argument is liberally strewed over the speeches of Chatham himself, although the popularity of that nobleman prevented the nation from interpreting the meaning of his free advice to his sovereign, when he told him that he could not hope to act by any minister without the aid of the powerful families of England: There might be practical truth, but there was little democracy in this sentiment.

During his opposition to the American war, Burke was certainly at an elevation of just favour, sufficient, perhaps, to be a zenith to the fame of any man but himself. A pacific adjustment of the differences between the mother country and America, when affairs had gone so far, might have admitted of principles more permanently decisive than his, but they admitted of none more adapted to save the dignity or prejudices of Britain. For a lasting reconciliation, the abandonment of the right of taxation might have been advisable; but for immediate truce, which ought to have led to reconciliation, the abandonment of the question of right was better suited; or, perhaps, even an indistinct recognition of it. But the blundering hands which succeeded the short Rockingham administration, did not do justice to the mildly temporizing policy of that amiable cabinet. The American war at last became popular.—Now it is fashionable to lay the blame of it on Grenville and North.—A murderer might, with equal justice, blame the sword, with which he has killed an innocent man, as the British people accuse their ministers—their servants—with the criminality of a war, in the events of which they not only partook, but sympathized in every fibre of their hearts. If we do not recollect from our own memories, our fathers have told us, that Washington was burnt in effigy in England, and would have been hanged in reality amidst the applause of millions, if he could have been laid hold of.

In March 1782, an end was put to the ministry of Lord North; and on the return of the Marquis of Rockingham to power, Burke became paymaster of the forces, and had a seat at the council-board. The death of Lord Rockingham effectively dissolved the ministry, and on the appointment of Lord Shelburne, Mr Burke, with many of the Duke of Portland's friends, resigned. After the peace, he had a leading share in the formation of the coalition, which gave a shock to the public ideas of political consistency beyond what either the enlarged mind of Fox, or the more accommodating ideas of Burke, had room to anticipate. Mr Pitt, by seizing on the happy moment when both king and people were on bad terms with the ministry, turned them out, and withstood minorities in the House of Commons till that house presented him with majorities. In 1785, Burke seems to have taken a sufficiently independent ground in differing at once with the minister and with the leaders of the opposition respecting the reform bill of Mr Pitt. Such a conduct was consistent enough with his ideas of ruling by great families, and preserving the borough influence in the hands of a few nobles. His impeachment of Warren Hastings, was one of the next and most important events of his life. For even the outline of so complex a trial, we have not limits. On this subject, the majority of commonly enlightened readers are as completely undecided, or at least incompetent to be decided in their opinion, as on the most abstruse problem in science; for in fact, the Principia of Newton might be studied in less time than the real substance of the trial of Hastings. Many men, however, as we believe, unbiased in the question, have, after laborious attention to it, made up their opinion, that whatever were the oppressions perpetrated in India, Britain, and not Hastings, was responsible for them. All the conduct of Burke, which forms the external avenues to the question, gives, as far as that goes, a sanction to this opinion. He was violent, bitter, and full of ostentation. In the moment of Hastings's hesitation about the ceremony of kneeling at the bar, an hesitation proceeding from accident, he commanded him to
kneel, with a ferocity in his countenance which no painting could express. He marched at the head of the managers of the indictment, with an air of pompous elocution; and, in fine, it is evident, that he had Cicero against Verres incessantly in his eye during all his rhetorical appearances on this subject.

In the settling of the regency on the king's illness in 1788, he took a warm and active part. His appearances on this subject always gave more alarm to the opposition than the minister. In the short period that elapsed between this question and the French revolution, there were no party circumstances of which we know that could alienate him from the opposition (for his jealousy of Sheridan is not an idea consistent with the bulk or frame of his mind,) so that his sentiments on the French revolution could not be supposed to be connected with personal pique, and the general tone of his character forbids the suspicion of his having been corrupted. His principles had been before more than suspiciously aristocratic on very important occasions, and there was nothing in the French revolution, as it proceeded, to conciliate the affections of a mind imbued with such a bias, unless the observer had lived to read the court calendar of Bonaparte.

His abhorrence to the French revolution preceded the worst acts of that event; and though, like every evil-wisher to change, Mr Burke predicted as many atrocities as took place, yet we must hesitate in pronouncing those warnings to have been uttered in the spirit of prophetic wisdom; for he foretold many things directly the reverse of what happened. Among these was his prediction, that France "would be blotted out from the map of Europe." As early as the beginning of the year 1790, he spoke his sentiments with plainness and warmth in the House of Commons, in which he renounced friendship with Mr Fox, and all who cherished sentiments like his on the same principles and subject. From that time he busied himself in his memorable work on the French Revolution, a work which commenced a war of the press on the great principles of government, evoking greater polemical talents in writing than had been displayed since the pamphlets of Milton and Salmusius. It was answered at home by Mackintosh and others, and abroad by Paine. The coarse, but popular, eloquence of the last writer could not indeed be compared with the philosophical spirit of the British writers; but it struck lower at the root of common opinion, and produced effects we all remember how serious. By his enemies, the work of Burke was described as a blaze of rhetoric around a nucleus of false principles and sophistry. The majority of the nation, of that part at least whose property gave influence in the country, did not think so; and his opinions certainly gave a decided bias to the warlike measures of the cabinet. His second attack on the revolution, in a letter to a member of the French National Assembly, was made in 1791, when affairs were yet assuming a deeper horror to the revolution, and gave an air of secure triumph to his exposition of principles not essentially connected with its errors. His Appeal from the New Whigs to the Old; his Letter to a noble Lord on the subject in discussion with the Duke of Bedford; and his Thoughts on a Regicide Peace, attested his ensnared and increasing zeal on the subject of his great political passion.

It was objected by his enemies, that his zeal was not unirrigorated by royal bounty. His hospitality and personal generosity, had always made him a needy man. He entertained an aristocratical opinion, long and frequently expressed before he depended for his main support on the pensions of his sovereign, that a man of first-rate abilities had a right to be supported at the public expense. Confined to such genius as Burke's, this doctrine might be safely admitted by the austerist republican; and few, we believe, of his political enemies, would rest it as a serious charge against his memory, that he supported the close of so illustrious a life on the kindness of royal patronage. He who could grudge the pension of Burke, is surely unworthy to be his reader or his countryman.

The close of his political career was marked by an honourable attachment to the cause of the emancipation of the Irish Catholics, which he expressed and enforced in a letter to Sir Hercules Langrishe, written in 1792. He withdrew from parliament in 1794, and his seat for New Malton was occupied by his only son, whom he viewed with all the partiality of paternal admiration. The death of that son precipitated the decline of nature, which he was already beginning to feel. After his death, Burke lived only to die; such was the expression used in describing the effect of this event on his mind, by the Irish orator Grattan, in the hearing of the writer of this article, when the great subject of this biography happened to be the topic of conversation in company. He expired in his 65th year, on the 8th of July 1797.

He was amiable and exemplary in his domestic relations, elegant in his taste, and benevolent in his intentions. Few men have performed greater services to the public, and none have filled, during their lives, a greater space in the public eye. (*)

BURLESQUE. See Poetry.

BURLINGTON, a county of North America, in the state of New Jersey, lies between the Delaware river and the Atlantic ocean, and extends about 60 miles in length, and 30 in breadth. This county is in general level and well watered; and, out of 250,026 acres, 194,600 are in an improved state. It contains 11 townships, 15,500 white, and 520 black inhabitants; of which last, 58 are slaves; and furnishes 3000 militia. Its principal towns are Burlington and Bordentown. (p)

BURLINGTON, a town of New Jersey, and capital of the county of Burlington, extends three miles along the east bank of the Delaware, and was first settled in 1677. The most populous part of the town is built upon an island, about a mile and a quarter long, and three quarters of a mile broad, which communicates with the mainland by four bridges or causeways. The principal streets are regular and spacious, and ornamented with rows of trees in front of the houses. It has an Episcopalian chapel, a Quaker meeting-house, an academy, and a free school; which last is supported by the profits arising from the island of Mittenkunk, which amount yearly to L.180. It has also a court-house,
two market-houses, and the best jail in the state. Burlington is a free port, and possesses a very commodious harbour; but its vicinity to Philadelphia renders these advantages of little consequence. In the island are 160 houses, and about 1000 inhabitants, of which above 100 are negroes. North latitude 40° 3', West longitude 73° 54'. See Morse's American Geography, p. 239. (t.)

BURMANNIA, a genus of plants of the class Hexandria, and order Monogyne. See Botany, p. 183.

BURON. See SurgerY.

BURNET, THOMAS, according to the general opinion, founded on an inadvertent expression of Anthony Wood, was born in Scotland; but it appears, from the more respectable authority of Birch's Life of Tillotson, that his native place was Croft in Yorkshire. At the grammar school of North Alerton he made great proficiency, and was often held up by his master as an example to the rest of the scholars. In 1651, he was admitted of Clarehall in Cambridge, where he had for his tutor Mr. Tillotson, who was afterwards archbishop of Canterbury; and, in 1654, he went to Christ College, of which the learned Dr. Cadworth had obtained the mastership. In 1657, he was chosen fellow of that house. In 1658, he took the degree of A. M.; and, in 1661, was chosen senior proctor of the university. He travelled for some time with the Earl of Wiltshire; and, besides this, was governor to Charles, Duke of Bolton, and to James, Earl of Ossory, who was grandson to James, the first Duke of Ormond. Through the patronage and influence of the Duke, he was chosen master of the charter-house in London, and soon after took orders in the church. While in that situation, he distinguished himself by opposing, with equal vigour and success, an attempt on the part of James II. to place one Andrew Popham, a Papist, as a pensioner on the charter-house foundation. The other governors, with the exception of Chancellor Jefferys, supported him in this bold measure; and the monarch, meeting with such determined resistance, abandoned his purpose. In 1680, he published his Telluris Theoria Svera, a work which was much celebrated in its day, but has long since given place to new speculations, more accordant to the phenomena of nature, though equally insufficient to account for them all. It received high applause from several authors of repute, particularly from Bayle (Letter to L'Enfant), The Spectator (No. 146), and Mr. Addison individually, who Indited a fine Latin ode on the occasion; and it must be allowed to have a just claim to the praise of great learning, ingenious disposition, and elegant latinity. But it is very extravagant in some things, very unsound in others, and, upon the whole, amounts to little more than a beautiful geological romance. In point both of philosophy and religion, it has been deemed highly objectionable; and it no sooner made its appearance, than it was answered and condemned in various pamphlets, to which the author replied with ability. Among many others, Mr. Keill, the mathematician, in an examination of the theory, pointed out its inconsistencies as a work of science; and Herbert Crofts, Bishop of Hereford, animadverted with great keenness on its heterodox and anti-scriptural principles. Some very judicious and candid remarks on the merits of this theory, are to be found in Dr. Wallace's Various Prospects of Mankind, Nature, and Providence. After the revolution, Dr. Burnet was appointed chaplain in ordinary to King William. He was also, through the interest of Archbishop Tillotson, appointed clerk of the closet to that prince. But from this place he was removed in 1692, on account, it is said with some appearance of probability, of the offence which he had given to the clergy by the publication of his Archiologic Philosophica. That work, indeed, was by no means orthodox. It called in question the literal history of the fall; and contained an imaginary dialogue between Eve and the serpent, so extremely objectionable, that the author himself, who was sufficiently firm and opinionative in other cases, was very solicitous to have it suppressed in the subsequent editions of his book. It was understood, that this circumstance, along with the general suspicion entertained of his religious sentiments, produced a combination among the superior clergy to prevent him from obtaining that preferment in the church which, through the friendship of Tillotson, and the favour of King William, he might otherwise have expected to receive. So sceptical, indeed, was he accounted, and so strong was the prejudice against him, that all thoughts of his promotion were laid aside. He died in the year 1715. After his death, two posthumous treatises were published. The one was entitled De Fide et Officis Christianorum, in which he endeavours to give a compend of the doctrines and duties of Christianity, excluding what appears to him to be doubtful or unimportant, and insisting only on what he conceives to be of essential moment in both. This plan, it is evident, is liable to great abuse, and could not be very fairly executed by a man who, like Dr. Burnet, considered rather what should be, than what actually is, in the Christian revelation. The other treatise was entitled De Statu Mortuorum et Resurgen- tium. The leading point which he here maintains is, that the future punishment of the wicked is to be but temporary, and to terminate in salvation. Of this doctrine, which has been more taught by sentimental philosophers than by scriptural divines, the author perceived the dangerous consequences; and fearful, if not certain, that it would materially injure the interests of virtue among the bulk of mankind, he earnestly protested, in a note, against its being translated. The caution, however, was despised; for Dennis translated not only the book which contained the doctrine, but the note also in which its immoral tendency was acknowledged. Besides the productions already mentioned, it was discovered, after Dr. Burnet's decease, that he had written three tracts against Locke's Essay concerning Human Understanding, the first of which was animadverted upon by Locke himself, and all of which were answered by Mrs. Cockburn in her able defence of that celebrated essay. See Biographia Britannica; Birch's Life of Tillotson; and the Life of Dr. Thomas Burnet, prefixed to the translation of the Archiologie. (+)

BURNET, GILBERT, Bishop of Sarum, was
born at Edinburgh in 1643. His father, who was a Lord of Session under the title of Lord Crimond, and a younger son of the family of Leys in Kincardineshire, was attached to the Episcopalian, his mother to the Presbyterian, discipline; a circumstance which perhaps contributed to the liberality with which he always regarded lesser religious differences. At the age of 14, he commenced master of arts in the college of Aberdeen; and, having abandoned his original study of the civil law, he became probationary preacher when about 18. His rejection of a good living at that age, from a doubt of his competency to the charge, was a promising indication of the integrity of his future life. Having spent about three more years in theological studies in Scotland, and in visits to the English universities, he passed over to the Continent, and made some stay at Amsterdam and Paris. The year following, he returned to his native country—received priest's orders from the Bishop of Edinburgh—and was presented to the living of Saltonn, where he read the liturgy of the English church. When not more than 23 years of age, he ventured to draw up a memorial of the abuses practised by the Scotch bishops, which he defended with such success, that Archbishop Sharp thought fit to abandon his design of punishing him for his uncoutny remonstrance, by deprivation and excommunication. Three years after, he was appointed professor of divinity in the university of Glasgow, and conducted himself with such moderation to the Conformists and Non-conformists, as to gain the censure of bigots of both classes.

A Scotch bishopric was twice offered him about this time, which he judged it prudent to refuse. He published, however, in 1672, A Vindication of the Authority, Constitution, and Laws of the Church and State of Scotland, which was dedicated to the Earl of Lauderdale; and the principles of which very well accorded with that nobleman's well-known zeal on the side of prerogative and power. On his visiting London in 1673, he was appointed one of the king's chaplains in ordinary, and appeared to be in the high road of preferment; but for the present, his strong attachment to the Protestant cause was in the way of his ambition, and he was too honest a man to sacrifice principle to promotion. He soon lost the friendship of Lord Lauderdale; and having resigned the professorship at Glasgow, and removed to London, he was presently struck out of the list of chaplains to the king. Being now freed from the shackles of court-connection, Burnet devoted himself, with his characteristic assiduity and zeal, to the service of his country, by resistance to the Catholic encroachments. With this view, he published, in 1679, the first volume of his History of the Reformation in England—a production of labour and authority, to which the state of the times added so much of incidental value, that a vote of thanks to the author passed both houses of parliament, accompanied with a request that he would complete the design. The second volume appeared two years after; and a third, which is supplementary, not till the year 1714. Burnet, both from disposition and on principle, was inclined to moderate measures; and proposed, at a time in which the public mind was violently agitated by the Popish plot, that some measure of compromise should be attempted, instead of so harsh a proceeding as the exclusion of the Duke of York from the succession. Notwithstanding this conciliatory proposal, his connection, particularly with Lord Russell, his publications, and his undisguised warmth of attachment to the Protestant interest, rendered him so obnoxious to the king and his friends, that, in 1683, he prudently determined to retire to Paris. The following year, he was discharged, by the king's order, from his lectureship at St. Clement's; and on the accession of James, he became, for some time, a resident in Paris. At length, after having seen the tour of Italy, Switzerland, and the south of France, by the invitation of the Prince and Princess of Orange he settled at the Hague, and obtained naturalization. Having lost his first wife, Lady Margaret Kennedy, daughter of the Earl of Cassils, he now married a Dutch lady of fortune, descended from the Scotts of Bruceleigh in Scotland. The widow Berkeley was his third wife, whom he married in 1698.

The Prince of Orange was too good a politician not to see, that the principles, talents, connections, and reputation of Burnet, all conspired to make him a valuable auxiliary to his cause, if he once espoused it warmly. He therefore did not hesitate to refuse the surrender of him to the English government when it was formally demanded he should be delivered up; and in the progress of the preparations for the great enterprise which placed William on the throne of England, his experience of the fidelity and services of Burnet induced him to nominate him his chaplain, in which capacity he accompanied him in the expedition to England. On the successful issue of that great design, Burnet found himself in the road to promotion, without any obstacle, either from principle or feeling. His well-known moderation suited the temper of the present government, and both his public services and private worth recommended him to ecclesiastical elevation. In 1689 he was raised to the see of Sarum, the duties of which he discharged in a manner the most exemplary, devoting himself to the labours of the pulpit and of the diocese, with a zeal and assiduity which have rarely been equalled, and never surpassed. An institution of a nursery of students in divinity at Salisbury, under his own immediate inspection, showed how great was his anxiety to secure a pious and enlightened clergy. He was, however, induced to abandon that favourite project, on being informed that it was regarded as a censure on the universities.

It is a singular fact, that in a pastoral letter to his clergy, the bishop maintained the right of William and Mary to the crown on the ground of conquest. But his aversion to Popery, and his zeal for the Protestant succession, were so great, that to his mind, conquest was a better title in a Protestant, than possession in a Papist. It is rather more extraordinary, that the celebrated philosophical and sceptical writer, Charles Blount, should have maintained the same doctrine in a pamphlet, entitled, King William and Queen Mary, Conquerors. Three years after the publication of the pastoral letter, it was ordered by parliament to be burnt, together with Blount's pamphlet, by the hands of the common hangman.

Besides a number of minor productions, Burnet...
BURNETT.

* We have given this short abstract of the genealogy of Lord Monboddo, as it forms no improper introduction to the life of a man, who considered the adventitious circumstance of birth as a matter of no small importance, and who has even introduced the subject into his writings. See his Ant. Metaphysics, vol. iii., Book ii. chap. 8.

James, James.

Published An Exposition of the Thirty-nine Articles of the Church of England, a work which ranks with the theological treatises of that nature. He also left for publication after his decease, The History of his own Times, with an Account of his Life, which was published by his son Thomas, in two volumes folio, in the years 1723 and 1734. This work, with all its defects and redundancies of style and matter, is valuable as a collection of authentick memoirs of persons whose names are connected with some of the most important events in English history; and it is not rendered the less interesting to most readers, by the garrulity and egotism which it often displays, but which always exhibit the writer as a man of simplicity, integrity, and considerable parts, a great part of whose life was passed in intimacy with men of rank and genius, and who himself sustained a very important and honourable part in the great transactions of the day.

Many anecdotes respecting him are in ordinary circulation, some of little interest, and others of little authority. He has himself left a record of his instrumentality in the conversion of the Earl of Rothiemay, in his published account of the life and death of that nobleman. Of the genniness and saving efficacy of his faith and repentance, he appears to have received a full conviction, more honourable to his heart than his judgment. It is also certain that a visit which he made to Mrs Roberts, a mistress of the king, in her last moments, suggested to him the propriety or duty, as he supposed, of addressing a monitory and expostulatory letter to Charles II. on the vices of his life and errors of his government. It is said the king gave it a second perusal before he threw it into the fire, but that he never forgave the writer. The life of this honest man and exemplary prelate was terminated by a pleuretic fever, March 17, 1715, in the 72d year of his age. See Burnett's History of His own Times, and Biography Britannica. (J. M.)

BURNETT, the Honourable JAMES, a senator of the college of justice in Scotland, by the title of Lord Monboddo, was descended from the ancient family of Burnett in Kincardineshire, who have possessed the domains of Leys, on Deeside, ever since the days of Robert the Bruce; and upon whom that monarch conferred the hereditary office of fo. rester of Mar, accompanying the nomination with an ivory hunting-horn of very ancient workmanship. This symbol of office, suspended by a white satin sash, is still preserved in the venerable and gothic mansion of Crathes Castle, and forms a conspicuous part of the family arms, which are not inappropriately supported by a Highlander and a Greyhound. James Burnett, the great-grandfather of Lord Monboddo, was a grandson of Leys by a younger son of that family and the heirress of Craigmyle; and married Elizabeth, daughter of Captain Robert Irvine, of the family of Kincassie. Besides other properties, which were sold by his grandson, this gentleman acquired the estates of Lagavin and Monboddo, which still remain in the family, and are at present possessed by Mr Burnett, who married Helen, the only surviving issue of Lord Monboddo. His Lordship's grandfather married his cousin, Margaret, a daughter of Sir Thomas Burnett of Leys; and his mother was a daughter of Sir William Forbes of Craigievar. The subject of the present article was born at the family mansion of Monboddo, in the parish of Forndoun, in the end of October 1714. Of his early age, little is now remembered. From the parish school of Laurencekirk he went to King's College, Aberdeen, where he was distinguished as a young man of excellent parts, and where he imbibed that taste for Greek literature which he retained through life. Having finished the usual course of study in this university, he embarked for Holland, as was the fashion in these days, to study civil law. At Groningen he continued three years; and it has been remarked, that, during his residence in that country, he entirely lost his provincial Scotch dialect, and, from associating with some English gentlemen following the same pursuits, and some Protestant French refugees, he acquired a correct pronunciation of the French and English languages. On returning to his native country, he arrived in Edinburgh on the memorable night when Captain Porteous, of the city guard, fell a victim to the tumultuary fury of the inhabitants. Mr Burnett had taken up his lodgings not far from the prison; and, being aroused from his sleep by the noise of the mob, he hastily dressed himself in his nightgown and slippers, and sallied forth to ascertain the cause of the disturbance. He used frequently to recount the circumstances of that violent proceeding, and dwelt particularly upon the appearance of a stout fellow with a dyer's apron, who demanded that the rope should be given to him, and he would make Porteous dance in the air; which he effectually accomplished, notwithstanding the struggling and resistance of his helpless victim. Though curiosity alone led Mr Burnett to follow in the crowd to the Grassmarket, and to witness this scene of popular outrage, yet it seems that he had been marked, from the singularity of his dress, as having joined in the procession to the place of execution, and would have been laid hold of, had it not been found, upon inquiry, that he had arrived that afternoon from Holland, and consequently could not have had any share in this proceeding.

He passed lawyer in 1738, and, from his relationship with Fletcher of Saltoun, then Lord Justice-Clerk, and with Lord President Forbes, he was soon brought into notice. Lord Tweedale, who was an excellent Greek scholar, shewed him (he used to say) particular attention; and he frequently formed one of the party at the Lord President's Saturday's dinner—an honour, which he often mentioned even in his latter days, as the greatest he had ever received. During the interruption of law-business by the rebellion of 1745, he retired to London, where, having been recommended by President Forbes to Dr Murdoch, Dr Armstrong, Mr Thomson, and Mr Mallet, characters of the first celebrity in literature, he spent
some months in a manner highly flattering to a young
man ambitions of literary reputation. At Thom-
son's house in Richmond, this circle of friends fre-
tently met, when the bottle went briskly round, and
the hours of night fed on the wings of wit and
good humour; and, being always accustomed to
perform this short journey on foot, they generally
drank, like true Scotchmen, at every inn and tavern
on the road. Lord Monboddo used to observe, that
Thomson's physiognomy, when not roused, was
sluggish, dull, and unmeaning, without the slightest
appearance of poetical inspiration; but when his
heart was warmed with conversation and conviviality,
his countenance brightened up, and beamed with ex-
pression and intelligence. Of Dr. Armstrong as
a poet, he always expressed the highest opinion; and,
in his third volume on the *Origin of Language*, has
bestowed on the *Art of Preserving Health*, a very
high, but surely not more than an appropriate eulo-
giam. He represented the Doctor as naturally grave
and silent; but said that a bottle of wine made him
utter oracles of wisdom. Though they maintained
a regular correspondence till a few years before the
Doctor's death, yet no traces of it have been found
among his Lordship's papers. From the pleasure
which he then enjoyed in the company and conversa-
tion of these celebrated authors, he was induced fre-
quently to repeat his visits to London; and, in the
course of these excursions, he could number among his
friends some of the most distinguished characters both
for rank and erudition in the kingdom. Among these,
we may mention Dr. Markham, the late Archbishop
of York, the late Earl Stanhope, the first and second
Earls of Mansfield, Lords Thurlow and Grauntley, Bi-
shops Horsley, Louth, Porteous, Shipley, and Bur-
gess, Sir John Pringle, W. Seward, Esq., George
Lewis Scot, Esq., who had been the preceptor of his
present majesty, and Mr. Harris, the celebrated author
of *Hermes*. To Mr. Harris he attributed his first
knowledge of the Greek commentaries upon Aristotle of the
Alexandrian school; and, in the spring of 1769, he
made a journey to London, for the express purpose of
paying that celebrated author a visit, and of thank-
ing him in person for a present of the new edition of
his *Hermes*. During this visit, he was made known
to the venerable Lord, afterwards Earl, Bathurst,
and the first Lord Lyttleton; with the last of whom
he afterwards held a literary correspondence on the
subject of language, which is, in part, still preser-
voked among his manuscripts.

About 1760, he married Miss Elizabeth Farquhar-
son, a very amiable woman, whose father, being the
nephew of Keith of Cadham, a cadet of the Mar-
schall family, had accompanied Lord Marischall, and
his brother Marshall Keith, to the battle of She-
riffinuir,—from whence, however, he escaped, and,
concealing himself in the corps of artillery at Wool-
wich, rose to the rank of captain; in which situation
he died at Jamaica in 1741, in the expedition to Car-
thagea. By this lady he had several children, but
these all died infants except a son and two daughters.

Mr. Burnett had now been upwards of twenty years
a regular practitioner at the Scotch bar; and though
he was an ardent admirer of ancient literature, and
had spent much of his time in the pursuit of this
favourite study, yet he had never neglected the duties
of his profession, and yielded to none either as a
lawyer or a pleader. He was a leading counsel, and
a keen supporter of the Douglas cause, in favour of
Mr. Douglas of Douglas; and went thrice to France
for the purpose of attending the proof, where he
found his readiness of speaking, and even dictating
the French language, which he had acquired in Hol-
land, of the utmost service to him upon these oc-
casions, in examining witnesses, and taking down
the evidence. This cause had excited much pub-
lic attention, and had called forth all the abilities
and exertions of both parties. Mr. Burnett had
always the utmost confidence in the justice and ul-
timate success of his client's claim, and we have no
hesitation in declaring, that it was to his firmness, not
to mention his knowledge of the law, that Lord Doug-
las owes the establishment of his birthright, the estate
of his uncle, and of consequence his present rank among
the peers of Great Britain. It was often mentioned,
both by himself and the late William Robertson, Esq.
of the Register Office, then Mr. Burnett's clerk, that
at one time it had been proposed by Mr. Douglas's
lawyers at Paris, that the cause should be given up
as unctenable, and that even a letter had been pre-
pared for intimating this opinion to the Duke of
Queensberry; but Mr. Burnett, in the face of all the
other counsel, strenuously opposed this measure, and
so far succeeded that the letter was thrown into the
fire, and the cause allowed to proceed, which was af-
terwards brought to a successful issue in favour of
Mr. Douglas.

Upon Lord Gardenston becoming joint solicitor
general with the late Sir James Montgomery, Mr
Burnett was appointed sheriff of his native county of
Kincardine; and on the death of his relation, Lord
Milton, in 1767, he was raised to the bench by the
title of Lord Monboddo.* This appointment he
owed to the friendship of the late Charles Duke of
Queensberry, who on this, as well as on another oc-
casion, more than 30 years before in the case of Mr
Gay, with which all our readers who have perused
the works of Swift and Pope must be acquaint-
ded, displayed a respect for genius and literature,
and a magnanimity and dignity of character, which
throw the brightest lustre on his grace's memory.
This nobleman had obtained a promise from the
throne, that the first vacant gowin in the Court of
Session should be bestowed on Mr. Burnett. On
Lord Milton's death, therefore, the duke waited on
his majesty, and reminded him of his promise, which
was at once admitted, and orders immediately given
to the secretary of state to make out the royal let-
ter. Female intrigue, however, postponed for a time
the fulfilment of these orders. The lady of the se-
cretary was nearly allied to the family of Hamilton;
and being most naturally solicitous about the vote
which Mr. Burnett might give in the great cause

* It is worthy of remark, that his lordship was only the third on the bench in regular succession since the Revolution; his
predecessor, Lord Milton, having succeeded Lord Fountainhall in 1755, who was appointed November 1, 1689; and as Lord
Monboddo continued a membe of the court until his death, this series of three judges occupied more than a century.
The life of a Scotch judge presents few incidents for the illustration of the biographer. His attention is daily called to the same routine of business; and the duties of his office; when conscientiously fulfilled, leave him but little leisure, except during the periods of vacation, for following other avocations. During these periods, however, Lord Monboddo's whole thoughts were engaged in literary and philosophical pursuits; and so devoted was he to such studies, that he declined the acceptance of a judiciary gown, though pressed upon him both by his noble patron the Duke of Queensberry and by Mr. Dundas, afterwards Viscount Melville, lest its duties should interfere with his favourite pursuits. These studies were his chief consolation in the midst of domestic affliction. He had lost, in 1774, a favourite and only surviving son, a very promising boy, in whose education he had taken particular delight; and his lovely wife, the object of his dearest tenderness, and whose exquisite beauty was the least of her attractions, was snatched away from his affections after an union of only six years. She died in autumn 1766, in childbed of a daughter, whose charms were a copy, but a very just one, of those of her mother, and who grew to be the pride and comfort of her father's declining years.

Allured by the charms of ancient learning, and endowed with a genius peculiarly fitted for the perception of its beauties, and the investigation of its doctrines, he gave himself entirely up to the study of its different branches. Criticism, grammar, moral philosophy, and logic, were his prevailing studies; and, in his work On the Origin and Progress of Language, he has evinced a critical acuteness, a chasteness of taste in composition, and a discrimination of the various kinds of style, and of the ornaments appropriate to each, which have seldom been equalled; but in the midst of great erudition and genius, candour must acknowledge, that there is, in some of his philosophical works, an absurd mixture of whim and conceit. The first volume of this work was published in 1771, the second in 1773, and the third in 1775. This publication was intended chiefly to vindicate the honour of Grecian literature; and, with the same partiality for antiquity, he began another work in 1778, entitled, Ancient Metaphysics, in which he defends the cause of Grecian philosophy. As long as his Lordship has kept close to this subject, he has given very comprehensive views of the doctrines of the ancient philosophers. On these doctrines he was completely at home; but when, in the prosecution of his plan, he advanced into the regions of geometry and natural philosophy, his total ignorance of the modern discoveries, in those sciences, led him not a little into confusion and perplexity. It must be remembered, however, that in the youth of Lord Monboddo, education consisted entirely in classical learning, and in the knowledge of the ancient systems of philosophy, formed by Plato, Aristotle, and their followers. Geometry had not then become a popular study; and natural philosophy and chemistry were little attended to, except by those who followed professions with which they were particularly connected. It was not, therefore, to be expected, that he should renounce the partialities of his youth, and, in the midst of active professional employment, follow, with scientific correctness, the progress of modern improvement in the different branches of philosophy. Let it also be considered, that he was now far advanced in life, and though his judgment was still vigorous and unimpaired, yet his memory had begun to fail him, which may account for the frequent repetitions that are to be found in the latter parts of his works. His writings, however, bear internal marks of the extensive erudition and penetrative genius of their author; and to draw their character, would require the pen of a philosopher, learned as himself in all the languages and systems of the ancients, which he has so ably illustrated. His conceits are the eccentricities of genius relying on its own energies, and despising the restraints imposed by established opinions; and, however paradoxical, they discover a discriminating understanding and a benevolent heart. He published, in all, six volumes on language, and the same number on metaphysics; the last volume of which came out a short time before his death.

As soon as he became an author, he found his company and conversation courted by many of the most distinguished literary characters of the age. Every stranger of distinction who visited the capital of Scotland, had letters of introduction to Lord Monboddo, and his house became the resort of genius, literature, and science. To resume the acquaintances of his youth, and to enjoy the conversation of some eminent scholars, whom he could count in the
number of his intimate friends, he went to London in the spring vacation of 1780. Here he was so caressed and sought after, and was so delighted with the respect and attention which he universally received, that he continued to pay an annual visit to the metropolis, until he was rendered incapable, by age and infirmities, for undertaking the journey. When in London, his visits were not confined to the library and study of the scholar or man of letters; he took particular delight in shewing himself at court. He frequented the levee and drawing room of St James's; and the king is said to have taken a pleasure in conversing with the old man, with a distinguishing notice, that could not but be very flattering to him. But in the midst of this universal respect and esteem, while he was in the very blaze of his reputation as an author, and his declining years were sweetened by the caresses of his family, and the kind attentions of his friends, his feelings received a shock by the death of his youngest daughter, from which he never completely recovered. This young lady, in personal loveliness, was one of the finest women of the age, and was second to none in the graces of her mind. To her father's benevolence of disposition she added his refined taste for elegant literature. Wherever she appeared, she was attended with general admiration, and many were the suitors she attracted to her father's house, and her father's table was often surrounded by all that was truly respectable among the youth of her country. Poetry and the fine arts were her prevailing amusements; and though she mingled in the world of fashion, she shared in none of its follies. Her chief delight was to be the nurse and companion of her declining parent; and her utmost wish to soften, by assiduity and kindness, the pillow of age. "She was the ornament of the elegant society of the city in which she resided," says one of Lord Monboddo's biographers, "her father's pride, and the comfort of his domestic life in his declining years. Every amiable and noble sentiment was familiar to her heart; every female virtue was exemplified in her life." The poet Burns, who, on his first appearance in Edinburgh as an author, was zealously patronized by Lord Monboddo and his daughter, and whose feelings were exquisitely alive to the emotions of gratitude and admiration, celebrates the charms and excellence of Miss Burnett in the following beautiful stanza:—

Thy daughters bright thy walks adorn,  
Gay as the gilded Summer sky,  
Sweet as the dewy milk-white thorn,  
Dear as the raptured thrill of joy!  
Fair B—— strikes the adoring eye;  
Heaven's beauties on my fancy shine.  
I see the Sire of Love on high,  
And own his work, indeed, divine.†

By the death of his accomplished daughter, who was cut off by a consumption in the 25th year of her age, the strongest tie was dissolved which bound him to society and to life. From that time he began to droop exceedingly both in his health and spirits, and died at his house in Edinburgh, on the 29th of May 1799. His disease was a stroke of palsy, which rendered him quite insensible to bodily pain, and he expired without a struggle at the advanced age of eighty-five.

To a sound discriminating judgment, and a highly cultivated genius, Lord Monboddo added a dignity, benevolence, and integrity of character, which led him to reprobate every action that was inconsistent with the nicest principles of honour, or which savoured of meanness, injustice, and oppression. As a judge, he conscientiously discharged the duties of his office; his decisions were sound, upright, and learned, and always marked with acute discrimination. Although rigidly temperate in all his habits, yet he delighted much in the convivial society of his friends; and he was excelled by none in playful humour, which, being always accompanied in him with the gravity of the judge, was doubly striking in its effects. With the learned he was the philosophic sage; but with the young and the gay, he was the liveliest, the most sportive and playful of the party. His conversation was both amusing and instructive, and excited the wonder and admiration of all his learned acquaintance, for the clear arrangement of his ideas, and the correct and perspicuous language in which they were expressed. His perpetual pursuit was, what he considered the chief object of human life, the improvement and culture of his mental powers. Lord Monboddo, however, had peculiarities in an eminent degree. His unbounded admiration of the customs, the literature, and the philosophy of the ancients, strongly prepossessed him in favour of whatever was connected with such studies. In them he supposed that he beheld all that was praise-worthy and excellent, while he looked upon the moderns as a degenerate race, exhibiting only effeminacy and corruption. This attachment to ancient manners, led him to imitate them even in his amusements and habits of life. He was fond of athletic exercises in his youth, particularly fencing and fox hunting, which tended to strengthen a constitution naturally healthy and robust. His general hour of rising, in all seasons, was six in the morning; and, till a late period of his life, he used the cold bath in the open air, even in the middle of winter. He took a light early dinner, and a plentiful supper. The ancient practice of anointing even was not forgotten; though the lotion he used was not the oil of the ancients, but a saponaceous liquid, composed of rose-water, olive oil, saline aromatic spirit, and Venice soap, which, when well mixed, resembled cream. This he applied at bed-time, before a large fire, after coming from the warm bath. His method of travelling was also in conformity to his partiality for ancient customs. A carriage, which was not in common use among the ancients, he considered as an engine of effeminacy and sloth; and to be dragged at the tail of a

† Burns, in a letter to Mr Chalmers, dated from Edinburgh, 27th December 1786, bears further testimony to the charms and excellence of this lady: "One blank," says he, "in the Address to Edinburgh, 'Fair B——,' is the heavenly Miss Burnett, daughter to Lord Monboddo, at whose house I have had thing nearly like her, in all the combinations of beauty, grace, and goodness, the great Creator has formed, since Milton's Live on the first day of her existence." See Currie's Life of Burns, vol. ii. p. 32.
horse, instead of mounting upon his back, appeared to him to be a truly ludicrous degradation of the genuine dignity of human nature. In all his journeys, therefore, between London and Edinburgh, he travelled on horseback, attended by a single servant; and this practice he persisted in, until he was upwards of 80 years of age. On his return, however, from his last visit to London, he was taken so exceedingly ill upon the road, that he was unable to proceed; and had he not been overtaken by a Scotch friend, the late Sir Hector Monroe, who took him into his carriage, and set him down at the first stage, (for he scorned to perform the remainder of the journey in a box,) he might, perhaps, have actually perished by the way side.

As Lord Monboddo accounted population the true wealth of an estate, he spent much of his leisure time, during the vacations of the court, in improving his paternal inheritance, by cultivating an extensive farm round the family mansion; and his principal desire was to increase the number of souls upon his lands, so as to make it greater in proportion to the extent, than that of any neighbouring landholder. While in the country, he dressed like a plain farmer, and lived among his tenants, with all the patriarchal familiarity and attention of an aged father among his grown up children. He encouraged them all by his advice and example, and, what was more substantial, by long leases, almost rights of inheritance, as he not very improperly called them. For these patriotic exertions, his memory will be recorded and revered in Kincardineshire as long as agriculture and hospitality shall continue to be practised. (p)

BURNT. See CHEMISTRY.

BURNT OF THE DEAD. All the nations of the world, rude and civilized, have, in every age, exhibited some remarkable ceremonial in the disposal of their dead. Some, by simple inhumation, have restored the body to its parent earth; others have committed it to the waters; and others again have reduced it to ashes, which were either collected as precious memorials of the deceased, or dissipated in the air. In one respect, perhaps, this latter custom has been adopted, to testify the unwillingness of the survivors to part with all remembrance of a departed person; and there are nations which yet preserve the corpse entire in token of veneration, or despoiling it of the flesh, carefully keep the bones. However, the necessity of destroying the body, or some religious rite, has probably operated as a more general inducement. Cremation, or burning the dead, has been practised in Europe, Asia, and the vast continent of America, from the most remote period to which authenticated history can reach: and although it has partially given way to other customs, there are many places where it is retained to the present day.

Remounting to Jewish history, long before the birth of Christ we are told, that after Saul fell on his own sword, "all the valiant men arose, and went all night, and took his body and that of his sons from the wall of Beth-shan, and came to Jabez, and burnt them there." The same is to be inferred from various other passages; but it is doubted whether Azaz king of Judah was burnt, as generally believed, because it is only said in scripture that there was a burning for him—not of his body; and Jeremiah addresses Zedekiah thus: "Thou shalt not die by the sword; but thou shalt die in peace, and with the burning of thy fathers, the former kings who were before thee; so shall they burn odours for thee." Thus the burning of odours may have been some rite or ceremony in honour of the deceased among the Jews.

But we are better acquainted with the Greek and Roman modes of cremation, from the histories transmitted to our own times. A lofty pile was constructed, on which the body was laid, various ceremonies ensued, and the whole was then reduced to ashes. Yet although the custom of burning the dead generally prevailed, it was not in universal practice: there were some absolute exceptions; and in other cases it depended on the circumstances of the deceased, or those of his relations. Among the Romans, infants who had not got their first teeth were never burnt, somewhat like the custom of Christians in denying consecrated ground to those that perish in the earliest infancy. Those struck with lightning also, were interred, probably from thinking it impious to commit to earthly flames bodies which had been touched by the fire of heaven.

The ancients were more prone to a minute and systematic performance of each of the different funeral rites, from the peculiar superstitions which they entertained. They believed, that unless the body was returned to the earth by inhumation, or entombed after being reduced to ashes, access was denied to the Elysian fields. Thus their principal care was pious offices to the dead.

As the Romans believed that the soul forsook the body by the mouth, the nearest relative watched the moment of its flight to receive it by an inspiration. The eyes and mouth of the corpse were then closed by the same individual, or if a husband by the wife, and of a wife by the husband. Next the body was washed and anointed with women, with precious ungents; and after a certain interval the name of the deceased loudly called, either from some superstition motive, or to avoid the hazard of a premature death on the funeral pile, if the person was only in a swoon. Examples are recorded of those who were on the bier reviving, descending from it, and walking home in health; and a noted instance also, occurred, where one, aroused from insensibility by the flames of the pile crackling around him, made an ineffectual endeavour to escape, and was burnt alive. The rings, which constituted a distinguished mark of rank among the Romans, were now taken from the fingers of the deceased, though restored before the whole ceremony of cremation was concluded.

In the next place, the corpse being clothed in the best garment worn during life, was laid on a couch, sometimes constructed of costly materials, such as that of Cesar, which, Suetonius relates, was of ivory, adorned with purple and gold. This was borne to the pile by the nearest relatives; or, if the deceased had enjoyed celebrity, his body was supported on the shoulders of others of note. Thus Augustus, whose obsequies were performed with great solemnity, was carried to the pile in the Campus Martius by
Burning.

senators, and Julius Caesar, in like manner, by the magistrates of Rome. Others were supported by their freedmen; and Trebius, who had relieved the wants of the people in time of scarcity, was borne on their shoulders to be burned. Although cremation was denied to infants, yet if they attained a certain period, the ceremonial demanded that they should be borne to the funeral pile by their mothers.

Much funeral pomp was now displayed: In bearing the corpse to the pile, each attendant had his own place assigned; and along with the couch were carried many others, containing waxen busts of the ancestry and relatives of the deceased. A solemn dirge was sung, accompanied by trumpets and other instruments, and an oration in honour of the deceased was recited. While that on Julius Caesar was heard, his body rested under a gilt pavilion, and the robe in which he had been killed was suspended aloft to public view. His image, also, exhibiting all the wounds he had received, was exposed in a moveable carriage.

The pile prepared to receive the deceased was of a pyramidal form, lofty in proportion to the rank he had enjoyed. When the couch bearing the corpse was deposited upon it, the eyes were opened, and the rings restored to the fingers. Then the nearest relation filled the mouth with a certain aromatic potion, and, turning away his face, applied a lighted torch. Perfumes were thrown over the pile; wine poured among the flames to promote the combustion; and invocations offered up for the aid of the winds to consume the body.

In the mean time, if the pile was that of an illustrious warrior, the soldiers marched three times around it with inverted weapons, and striking the ground at certain intervals.

Various bloody sacrifices were made to the manes of the deceased: Animals were thrown into the fire; dogs and horses were destroyed along with their owners; nay, slaves and captives were also barbarously burnt alive. Everything that the deceased prized during life was consumed; so that it might, according to the superstitions of the ancients, be useful to him after death. But to avoid the cruelty and expense of burning slaves or captives, a blood-coloured vestment was generally thrown on the pile.

Games, pantomimes, and the combats of gladiators followed, at which one of the most conspicuous characters was the Archimimus, who personated the manners of the deceased. At the funeral of Vespasian, the archimimus, with the characteristic avarice of that emperor, declared, that, rather than that the intended expense should be lavished on his obsequies, he would have his body thrown into the Tiber. The games were protracted during three days at the funeral of Publius Licinius; and Livy records, that no less than seventy gladiators fought on the occasion.

When the pile was consumed, the fire was extinguished, and the embers soaked in wine. The nearest relatives, or eminent men, habited in loose robes, and bare-footed, collected the bones and ashes together. Thus, the chief of the equestrian order, attired in robes, and wearing sandals, gathered the remains of the Emperor Augustus. The ashes, after being sprinkled with wine and the richest perfumes, were committed to an urn, and the whole was consigned to the earth or to a tomb.

After returning from the ceremony, those who were occupied in it stepped over a fire for purification, as all who had seen a corpse were defiled; and priests and magistrates, before resuming their functions, were obliged to offer an expiatory sacrifice.

These general observations, as far as can be ascertained, apply to the Carthaginians, Greeks, and Romans, as well as to other nations of antiquity. With respect to the Romans, it is not well known how the ceremony commenced, or what were the causes of its discontinuance. Macrobius, who lived in the lower era of the empire, when describing the custom also spoken of by Plutarch, at his body the body of a woman to those of ten men; if numbers were burnt at a time, distinctly states, that in his own time burning the dead was not practised.

The true or fabulous histories of many nations contemporary with the Romans, and rising into notice at the period of their overthrow, refer to the burning of the dead; and their own accounts receive corroboration from the observations of others. Cassius relates, that the funerals of the Gauls were magnificent, and that every thing esteemed by the deceased was consumed along with his body; and Tacitus assures us, that although the Germans exhibited less ostentation, the bodies of illustrious persons were burnt with certain kinds of wood; and that the arms of all, and the horses of some, were consumed along with them. The practice extended over the north; and, descending still later, we find the Danes erecting piles to their warriors, the flames whereof might reach to heaven.

Burning of the dead, as we shall presently see, is not uncommon among the natives of the British territories in India. But this ceremony is attended with some singular circumstances among the Cucis or Kookies, a savage race of mountaineers dwelling in the north-east of Chittagong. When any one dies in a village, the body is carried by his relatives to some distance from the house, and deposited on a stage under a shed erected for the purpose. Some member of the family daily places a supply of meat and drink before the corpse, and assiduously guards it from the depredations of dogs and birds while it remains in the shed. If another of the same family dies, the corpse is brought to the same place, and similar ceremonies are observed. Whatever be the time of decease, all the bodies are thus kept until the 11th of April, on which day the relatives assemble, and convey them to funeral piles, prepared on a certain spot within the precincts of the village, where they are burnt. The sheds where they had been deposited are likewise consumed. This ceremony being over, the whole persons concerned in it repair to the house of him in whose family the first death occurred in that year, and partake of an entertainment given in honour of the dead. On the following day, a similar entertainment is given by him in whose family the next casualty happened; and so on with the rest, until a feast has been given for each of the departed.

This feast in honour of the dead, called silicemium by the Romans, is given almost over the whole world, and is a rite still retained in Britain. Certain tribes of American savages preserve the remains of the deceased in the same way as the Kookies, until a certain time of the year.

The bodies of deceased Birmans are burnt; but as
the ceremony is attended with great expense, this
honour is not conferred on the poor. Funerals are
solemnized with much religious parade and semblance
of grief in the kingdom of Ava. The corpse, preceded
by women chanting a dirge, is carried in slow proces-
sion on a bier on men's shoulders, and attended by the
relatives in mourning. When placed on a pile, which is
about six or eight feet high, formed of billets of
dried wood laid across, with interstices to admit the
air and promote the conflagration, the priests walk
around, reciting prayers to their deity. When the
fire reaches the body, it is quickly reduced to ashes;
and the bones being afterwards collected, are deposed
in a grave. The bodies of the chief ecclesiastic
of a province, and of persons of exalted station, are
embalmed, and lie in state in some religious edifice
six weeks before they are committed to the pile.
Cremation of the dead is practised by the natives
of New Holland, a race which ranks lowest in the
scale of mankind. The surviving husband constructs
a pile to consume the body of his departed wife: he
collects her ashes, and, depositing them in the earth,
egresses a rude and simple memorial of her on the spot.

BURNING INSTRUMENTS.

Burning instruments are optical instruments for
producing an intense heat from the concentration of
the solar rays, either by reflection or refraction.
When the concentration is effected by reflection alone,
the instruments may be called CATOPTRIC BURNING
INSTRUMENTS; when the effect is produced by re-
fraction, they may be called DIOPTRIC BURNING IN-
STRUMENTS; and when the rays are concentrated
both by mirrors and lenses, they may be called CA-
TACTIC BURNING INSTRUMENTS. In practice, therefore,
to give an account of the different instruments which
have been employed for this purpose, we shall arrange
them under these three heads.

ON CATOPTRIC BURNING INSTRUMENTS.

It appears, from the authority of Plutarch, that
the ancients were acquainted with the power of con-
cave mirrors to concentrate the solar rays, and to
burn substances placed in their focus; and there is
every reason to believe, that it was by a contrivance
of this kind that the vestal fires were rekindled.
This method, however, of producing an intense heat
from the solar rays, can be practised only at short
distances, and is completely incapable of producing those
tremendous effects at a distance which Archimedes
is said to have exhibited at the siege of Syracuse.

The concurring testimonies of several ancient au-
thors * sufficiently establish the general fact, that by
a combination of mirrors, constructed by Archime-
des, the Roman fleet was either partly or wholly
consumed. By means of a similar apparatus, as we
are informed by Zonaras, (Annal. lib. xiv. p. 55.)
Proclus destroyed the Gothic ships in the harbour of
Constantinople, in order to protect his benefactor,
Anastasius, against the bold attempt of Vitalian.

The crediblity of these statements has been seri-
sously questioned by many modern mathematicians of
the highest eminence, and the exploits of Archime-
des at Syracuse have been confidently ranked among
the fables of antiquity. All this scepticism, how-
ever, seems to have been founded on the supposition,
that the Syracusan philosopher employed concave
mirrors; for if we suppose, along with Kircher and
Buffon, that Archimedes employed a combination of
plain mirrors, and if we make some allowance for the
exaggeration of ancient authors, we must admit it as a
fact well authenticated, and in no respect contradicted
by the principles of optics, that Archimedes construct-
ed a burning machine, by which he set fire to the
Roman fleet at a considerable distance. When the rays
of the sun are reflected from a plain mirror upon any

---

* The authors who mention the mirror of Archimedes, are Lucian, Galenens, Anthemiun, Eustathius, Tzetzes, and Zonaras.

Lucian, in his Hippasus, simply states, that Archimedes, by a singular artifice, reduced the ships of the Romans to ashes.
Galenus observes, (De Temperamentis, lib. iii. cap. 2. tom. i. p. 81. Edit. Basil.) "It is in this way, at least I think so, that
Archimedes burnt the enemy's vessels. For, by the help of a burning mirror, he may easily set fire to wool, hemp, wood, &c.;
and, in short, to any thing dry and light." Eustathius remarks, in his commentary on the Iliad, E. p. 388, that Archimedes, by an invention in catoptrics, burned the
fleet of the Romans at a distance equal to the shot of an arrow from a bow. According to Zonaras, (Annal. lib. ix. cap. 64.)
"Archimedes burnt the fleet of the Romans in an admirable manner; for he turned a certain mirror towards the sun,
which received its rays. The air having been heated on account of the density and smoothness of this mirror, he kindled an
intense flame, which he precipitated on the vessels which were in the harbour, and reduced them to ashes." When the fleet of Marcellus (says Tzetzes, Chronic. ii. 119.) was within bow-shot, the old man (Archimedes) brought out
a hexagonal mirror which he had made. He placed, at proper distances from this mirror, other smaller mirrors, which were of
the same kind, and which were moved by means of their hinges, and certain square plates of metal. He afterwards placed his
mirror in the midst of the solar rays, precisely at noon day. The rays of the sun being reflected by this mirror, he kindled a
dreadful fire in the ships, which were reduced to ashes at a distance equal to that of a bow shot. Dion and Diodorus, who wrote
the life of Archimedes, and several other authors, speak of this fact; but chiefly Anthemiun, who wrote the prodigies of
suns; and it is in these works that we read the history of the conflagration occasioned by the mirror of Archimedes.

Though these authorities are conclusive, yet no notice is taken of Archimedes's mirror by Polybius, Livy, and Plutarch.
object, the space occupied by the reflected light is always greater than the surface of the mirror, and this space increases with the distance of the object. The heat which is lost by reflection does not much exceed one-half of the direct heat of the solar rays; so that two plain mirrors, which reflect the sun’s light upon an object moderately distant, will produce a degree of heat nearly equal to the direct heat of the sun. By increasing, therefore, the number of mirrors, the reflected heat of the sun may be increased to any assignable magnitude. If the distance of the object is increased, the space occupied by the reflected rays from each mirror will also be increased; and, in proportion to this augmentation, the intensity of the heat will be diminished; but this diminution of the heat may be compensated by increasing the number of the mirrors. Hence it is possible, theoretically speaking, to produce any degree of heat at any given distance. In practice, however, the distance at which combustion may be effected is limited by several causes. While the reflected rays pass through the atmosphere, their force is considerably diminished by the density of the medium; and even when the plain mirrors are formed with the utmost care, they are still by no means free from irregularities on their surface. The angular deviation produced by these irregularities increases with the distance at which the reflected rays are received; and at the distance of a mile, the reflected light, instead of forming one large image, would be separated into various detached portions.

The next burning mirror that seems to have been constructed after that of Archimedes, was contrived by Anthemius of Tralles, who flourished towards the end of the fifth century. This learned architect was a favourite of Justinian, who employed him in the construction of various edifices, but particularly in the church of St Sophia at Constantinople, which he designed and executed. He was also the disciple of Proclus, from whom he probably received some information respecting the construction of burning mirrors, of which he has given a full and distinct account in a fragment entitled πηγανοδεικτικος παραθετητω. “Of Wonderful Machines,” which has been translated and illustrated by M. Dupuy, in the Mémoires de l’Académie des Inscriptions, 1777, tom. xlii. p. 392–431. The following quotation from this fragment, will give the reader a complete view of the invention of Anthemius, who appears to have been completely master of the subject upon which he wrote. After acknowledging, that it was universally admitted in his time, that Archimedes had destroyed the Roman fleet by means of burning mirrors, Anthemius observes, “Let us, therefore, bring and collect at one point other different rays, by means of plain and similar mirrors, in such a manner that all these rays, united after reflection, may produce inflammation: This may be effected by means of several persons holding mirrors, which, according to the positions indicated, send the rays to one point.

“But, in order to avoid the embarrassment resulting from entrusting this operation to several persons, (for we shall find, that the matter intended to be burnt does not require less than twenty-four reflections,) the following construction must be followed: Let there be a hexagonal plain mirror, and other adjoining similar mirrors attached to the sides of the hexagonal mirror by the smallest diameter, so that they may be moved on these lines by means of plates or bands applied, which unite them to each other, or by means of what are called hinges. If, therefore, we bring the surrounding mirrors into the same plane with the mirror in the centre, it is clear, that all the rays will undergo a reflection similar, and conformable to the common position of all the parts of the instrument. But if, the centre mirror remaining as it were immovable, we dexterously incline upon it all the other mirrors which surround it, it is evident that the rays reflected by them will tend towards the middle of the place where the first mirror is directed. Repeat the same operation, and around the mirrors already described placing other similar mirrors, all of which may be inclined towards the central mirror, collect towards the same point the rays which they send, so that all these united rays may excite inflammation in the given spot.

“But this inflammation will take place better, if you can employ for this purpose four or five of these burning mirrors, and even seven, and if they are all at the same distance from the substance to be burnt, so as that the rays which issue from them, mutually intersecting, may render the inflammation more considerable: For, if the mirrors are all in one place, the rays reflected will intersect at very acute angles; so that all the place around the axis being heated, the inflammation will not take place at the single point given.

“It is therefore possible, by means of the burning mirrors just mentioned, to carry inflammation to a given distance. Those who have made mention of the mirrors constructed by the divine Archimedes, have not said that he made use of a single burning mirror, but of several; and I am of opinion, that there is no other way of carrying inflammation to any distance.”

From the demonstration which Anthemius proceeds to give, but which we have not room for inserting, it appears that his mirror was constructed on exact geometrical principles, and was truly parabolic.

About the end of the sixteenth century, when an ardour for science began to prevail, we find the subject of burning mirrors again brought into notice. Our countryman, Leonhard Digges, in a work entitled Pantometria, published in London in 1571, and republished by his son Thomas Digges in 1591, mentions a burning mirror, which appears to have consisted of a combination of plain mirrors. In the Preface to the second edition, Mr Thomas Digges observes, “Archimedes also (as some suppose,) with a glasse framed by resolution of a section parabolical, fired the Roman nauie in the sea, comming to the siege of Syracuse. But to leave these celestial causes, and things dome of antiquity, long agoe, my father, hath at sundrie times, by the same beames, fired powder and discharged ordinaire half a mile and more distant, which things I am the bolder to report, for that there are yet living diverse of these his doings (oculati testes, eye witnesses,) and many other matters farre more strange and rare, which I omit as inperinent to this place.”

In the 21st chapter of the first book, the subject of burning glasses is resumed. “Some have fondly
Having procured a number of plain and circular glasses, he placed them upon a wall, at such degrees of inclination that they all reflected the light of the sun to one point, and produced a considerable heat. His principal experiments, however, were made with five plane specula fixed in a frame, so that they collected the solar rays at the distance of more than one hundred feet. At this distance he produced a degree of heat which sufficiently convinced him, that by increasing the number of his mirrors, he could have consumed inflammable substances at a much greater distance.

He informs us in his *Magica Catoptrica*, that the heat of the first reflection was different from that of direct light; that the light when doubled gave a very perceptible increase of heat; that it had the heat of a fire when tripled; that when quadrupled, the heat could still be endured; but that a fivefold reflection made the heat almost intolerable. From these results he concludes, that a combination of plain mirrors was capable of producing more powerful effects, than mirrors of a parabolic, hyperbolic, or elliptic form; and he entreats future mathematicians to prosecute the subject with a more numerous combination of plane specula. Not satisfied with these trials, Kircher, accompanied by his pupil Schottus, made a voyage to Syracuse in order to examine the position of the hostile fleet, and they were both completely convinced, that the ships of Marcellus could not have been more than thirty paces distant from Archimedes.

The seventeenth century was distinguished by the production of various burning mirrors, of different constructions. The principal of these were made by M. Vilette, a French artist at Lyons, who appears to have constructed no fewer than five of considerable magnitude. One of them was bought by M. D’Alibert for 1500 livres: another was purchased by Tavernier, and presented to the King of Persia: a third was sent by the French king to the Royal Academy; a fourth was bought by the King of Denmark; and the fifth was brought to England for public exhibition. The first of these mirrors was thirty inches in diameter, and weighed above a hundredweight. Its focal length was about three feet, and the size of the sun’s image was about half a Louis d’or. It was mounted on a circular frame of steel, and could easily be put into any required position. This mirror was made in 1678, and having been brought to St Germain by the order of the king, his majesty was so well pleased with it, that he rewarded Vilette with a hundred pistoles for the sight of it, and afterwards purchased it, and placed it in the royal observatory at Paris. The effects were the following:

1. A small piece of hot iron was melted in
2. A silver piece of fifteen pence was pierced in
3. A thick nail (le clou de paysan) melted in
4. The end of a sword blade of Olinde burnt in
5. A brass counter was pierced in
6. A piece of red copper was melted in
7. A piece of chamber quarrystone was vitrified in
8. Watch-spring steel melted in
9. A mineral stone, such as is used in harquebuses d’avoi; was calcined and vitrified in
10. A piece of mortar was vitrified in
11. Green wood and other bodies took fire instantly.

The mirror of M. Vilette which was brought to
England was put into the hands of Dr Harris and Dr Desaguliers, who made several trials with it. It was a composition of copper, tin, and tin glass; and its reflection had something of a yellow cast. There were only a few small flaws in the concave surface, but there were some holes in the convex side which was polished. The diameter of the mirror was 47 inches, its radius of curvature 76 inches, and its focal length 38 inches. The following results were obtained in June 1718, between 9 and 12 o'clock in the morning, and the time was measured by a half-second pendulum.

A red piece of Roman patera began to melt in 3 seconds, and was ready to drop in 100 seconds.

A black piece of the same melted in 4 seconds, and was ready to drop in 64 seconds.

Chalk taken out of an echinus, spargus filled with chalk, only fled away in 23 seconds.

A fossil shell calcined in 7 seconds, and did no more in 64 seconds.

The black part of a piece of Pompey's pillar melted in 50 seconds.

And the white part in 54 seconds.

Copper ore, with no metal visible, vitrified in 8 seconds.

Slag or cinder of the iron work said to have been wrought by the Saxons, was ready to run in 29 1/2 seconds.

The mirror now became hot, and burned with much less force.

Iron ore fled at first, but melted in 24 seconds.

Tale began to calcine at 40 seconds, and held in the focus 64 seconds.

Calcium humanus was calcined in 2 seconds, and only dropped off in 60 seconds.

The tooth of an anonymous fish melted in 32 1/2 seconds.

The asbestos seemed condensed a little in 28 seconds.

But it now became cloudy, M. Vilette says that the mirror usually calcines asbestos.

A golden malachite broke, and began to melt in 30 seconds.

A silver sispence melted in 74 seconds.

A King William's copper halfpenny melted in 20 seconds, and ran with a hole in it in 31 seconds.

A King George's halfpenny melted in 16 seconds, and ran in 34 seconds.

A tin melted in 30 seconds, and was vitrified in 40 seconds.

Cast iron melted in 16 seconds.

Slate melted in 3 seconds, and had a hole in 6 seconds.

Thin tile melted in 4 seconds, and had a hole and was vitrified in 80 seconds.

Bone calcined in 4 seconds, and vitrified in 33 seconds.

An emerald was melted into a substance like turquoise stone, and a diamond that weighed 4 grains lost 2/36ths of its weight.

This mirror was made by M. Vilette, some years after the first, and with the assistance of his two sons. It came into the possession of M. Vilette the son, engineer and optician to his electoral highness of Cologne, bishop and prince of Liege where he commonly resides. At the desire of several learned men, M. Vilette brought it to London, where its effects were exhibited in Priory garden, Whitehall.

The burning mirrors of Maginus, and of Manfredi Septala, a canon of Milan, do not appear to have produced such powerful effects as those of M. Vilette. The mirror of Maginus was only 20 inches in diameter, and it would appear from the different accounts in the Philosophical Transactions, that Septala had constructed two mirrors. The first, which was five palms, or about 17 1/2 feet in diameter, had a long focal length; but there is no particular information respecting its effects, which seem to have been far from powerful, as a gentleman who had seen it, declared, "that it could not set wood on fire but after the time of saying a misereur!" a method of measuring time not much in use among experimental philosophers. The other burning mirror of Septala seems to have been about seven feet in diameter, and to have had a focal length of 50 palms, or about 33 feet. See Schottus Magia Univers. Part I. vol vii. p. 6. p. 418.

In the year 1665, M. De La Carouste presented to the Academy of Sciences, a large metallic mirror, five feet two inches in diameter, and five feet in focal length. It was not equally polished, and a piece was inserted in the middle of it where the metal had failed. This circumstance, however, did not seem to diminish its force. Several trials were made with this mirror in the Academy, by order of M. De Louvois, but the precise effects which it produced have not been detailed. It is merely stated, that those who tried it were satisfied with the results, and that its effects would have been much greater had it been better polished, and mounted upon a proper stand.

On the 27th of February, 1667—8, Francis Smethwick, Esq. produced before the Royal Society two burning concave glasses, ground of a newly invented figure, which was probably that of a parabola. One of them was six inches diameter, with three inches of focal length; and the other was of the same diameter, with its focus ten inches distant. When these were brought towards a large lighted candle, they somewhat warmed the faces of those that were four or five feet distant; and when held to the fire, they burnt gloves and garments at the distance of about three feet from the fire. At another experiment made in the presence of Dr Seth Ward, the deeper of the two burned a piece of wood into flame in the space of ten seconds, and the shallower one in five seconds. This experiment was made in autumn, at nine o'clock in the morning, when the weather was gloomy. By exposing the deeper concave to a northern window on which the sun did not shine, it was found to warm the hand by "collecting the warmed air in the day time, which it would not do after sunset."

The burning mirror constructed by the celebra
ted M. Tschirnhausen, was formed of copper plate, scarcely twice as thick as the back of an ordinary knife. It was about three Leipzig ells in diameter. It was well polished; and burnt at the distance of two Leipzig ells. The following results were obtained with it:

1. A piece of wood held in the focus, flames in a moment, so that a fresh wind can hardly put it out.
2. Water applied in an earthen vessel immediately boils; and the vessel being kept there some time, the water evaporates all away.
3. A piece of tin or lead three inches thick melts away as soon as it is put in the focus; and...
when held there a little time is in a perfect fluid, so that in 2 or 3 minutes it is quite pierced through.

4. A plate of iron or steel becomes immediately red hot, and soon after a hole is burnt through it.

5. Copper, silver, &c. melt in five or six minutes.

6. Stones, brick, &c. soon become red hot.

7. Slate becomes red hot, but in a few minutes turns into a fine sort of black glass.

8. Tiles which had been exposed to the most intense heat of fire, melt down into a yellow glass.

9. Pot-shreds, that had been much used in the fire, melt into a blackish yellow glass.

10. Pumice stone melts into a white transparent glass.

11. A piece of a very strong crucible melted into a glass in 8 minutes.

12. Bones were converted into a kind of opaque glass, and a clod of earth into a yellow or greenish glass.

13. The beams of the full moon when at her greatest altitude were concentrated by this speculum, but no perceptible degree of heat was experienced.

Zacharias Traberus mentions in his book *In Nervi Optico*, that burning mirrors may be constructed by turning a large concave of wood, laying its surface equally with pitch, and covering it with square pieces of leaf gold about two or three inches broad. Large mirrors, he says, may be made of 30, or 100, or more concave pieces, artfully joined in a turned wooden dish or scuttle.

Parabolic mirrors of a large size, and very considerable power, were constructed by M. Hoezen of Dresden, and afterwards by M. Ehrard. These mirrors were composed of several pieces of solid wood, and on the convex part were pieces of wood, both diverging from the vertex and transversely, nicely fitted and strengthened. The concave part of this framing was covered with copperplate ½ of an inch in thickness, ½ feet long, and ¾ feet broad, so as to resemble one piece, finely polished. The speculum was so supported as to be easily managed, and the anterior part of it was subtended by an iron arch half an inch thick. The middle of this arch, which coincided with the place of the burning focus, was perforated into a ring, which supported from both sides an iron fork for receiving the body to be examined. Four of Mr Ehrard's mirrors constructed in this way had the following dimensions:

The celebrated Wolfius, who had witnessed the effects of these mirrors, assures us, that in burning, calcining, melting, and vitrifying, they far exceeded anything of the kind ever known. The hardest stones scarcely resisted a few seconds. Metals were rapidly perforated, and vegetables and bones were immediately burnt to a cinder and vitrified.

Our celebrated countryman, Dr James Gregory, turned his attention to the construction of burning machines, about the year 1670; and in a letter to Mr Collins, dated St Andrews, 7th March, 1673, he states his views on this subject, and requests Mr Collin's assistance to communicate it to Sir Isaac Newton, who returns a favourable opinion of the invention, in a letter to Mr Collins. The passages in these letters are too interesting to be given in any other form than in the original words of these distinguished authors.

"Mr Newton's discourse of reflection," says Dr Gregory, "puts me in mind of a notion I had of burning glasses several years ago; which appears to me more useful than subtle. If ther be a concave, speculum of glass, the ledent convex surface having the same center with the concave, or to speak precisely, albeit perchance to little more purpose, let the radius of the convex be c, the thickness of the glass in axis transitus f, the radius of the convexitie equal to \( \frac{9c^{2} + 16cf + 5f^{2}}{9c + 5f} \), this speculum sal have the foci of both the surfaces in the same point; and not on lie that, but all the rays which are reflected be twixt the two surfaces, sal, in their egresse, come, quam proximius, to the common focus. The making of such a speculum, requireth not much more airt than an ordain plate glasse, seing great subtllity is not necesser here: so that I believe they who mak the plane mirrour glasses, wod mak one of these, three foot in diameter, for four or five pounds sterling, or little more: for I have seen plane glasses, almost of that bignes, sold even here for less money. Now seing (as Mr Newton observeth) that al reflecting metalis lose more than one-third of the rays; this concave glasse, even ceteris paribus, would have an great advantage of a mettal one; for certinially an exactilie polished thin mirrour glasse, of good transparent mater, after a few reflections, doeth not lose one-fourth of the rayes; and, upon other accounts, this hath incomparable advantages, seeing it is more portable, free from tarnishing, and, above all, hardile thir of the value. The great usefulness of burning concaves, this being so obvious, and as yet (for quhat I know) untouched by anie, makes me jealous that there may be in the practice some fallacie. Ye may communicate this to intelligent persons, and especiallie to Mr Newton; assuring him that none hath a greater veneration for him, admiring more his great and subtle inventions, than his and yours.

P.S. If ye please, let me hear, with the first convenience, what may be judged the result of this burning concave; for I am as much concerned to be undeceived, if ther be an insuperable difficulty, as to be informed of an most surprising success. I have spoke of it to severals here, but al wer as ignorant of it as my self, &c.

Sir Isaac Newton's reply to Mr Collins is dated Cambridge, April 9th 1673, and contains the following passage:

"The design of the burning speculum appears to me very plausible, and worthy of being put in practice. What artists may think of it, I know not; but the greatest difficulty in the practice, that occurs to me, is to proportion the two surfaces so, that the force of
Burning Instruments.

Sir Isaac Newton's burning mirror.

Zeisier's method of making burning mirrors.

Burning instruments.

Both may be in the same point according to the theory. But, perhaps, it is not necessary to be so curious; for, it seems to me, that the effect would be sensibly less, if both sides should be ground to the concave and gage of the same tool, &c. &c. The attention of Sir Isaac Newton being thus accidentally directed to the subject of burning instruments, he procured seven concave glass mirrors, each of which was eleven and a half inches in diameter, and six of these were placed round the seventh, and contiguous, but so as to have one common focus. The general focal length was 22 inches and a half, and about an inch in diameter. It melted gold in about half a minute, and vitrified brick or tile in one second. —The effect of these specula was obviously much less than seven times the effect of any one of them. The rays of the sun could fall perpendicularly only on the one in the middle; and, in consequence of this obliquity of incidence, none of the specula intercepted a column of rays of the same diameter, and the image formed in the focus of each could not be exactly circular.†

Burning mirrors, composed of glass, were constructed by M. Zeisier of St. Petersburg. His object was to convert plates of plain glass into concave mirrors, which he effected, by placing the glass upon a convex tool, and exposing it to a strong heat, till it assumed the exact curvature of the tool. Zeisier made numerous trials with plates of various sizes, and, after several failures, he succeeded in finding the proper method of conducting the operation. No particular difficulties occurred in giving the proper shape to plates five or six inches in diameter; but, in forming one of 16 inches, the circumference was moulded to the tool before the central parts, where a number of vesicles of air had collected; and, in some other cases, the glasses cracked after they had received the proper shape. The following method is that which Zeisier always found to succeed:

A small bit of the glass to be used, must first be exposed to the fire till it becomes red hot, and if, after cooling, it has preserved its polish and transparency, the glass is fit for the required purpose, for it sometimes happens that the glass becomes quite black after the operation. The plate of glass is next placed on a concave iron dish of the required curvature, and put into a furnace. Coals are placed below and above the dish, and on all sides of it. The greatest care must then be taken that the glass shall become equally hot both at the circumference and at the centre, for if the red colour should get deeper in the middle, the glass will be in great danger. As soon as the whole is red hot, the instant of its bending to the shape of the mould must be carefully watched, and when this happens, which may be observed from the reflected images of the surrounding coals, all the fire must be removed from above the glass, and also a great part of the fire at its sides. The glass must then be covered with warm ashes, that have been passed through a sieve, and it must be allowed to cool gradually. It is of the utmost importance to mark the precise moment when the glass applies itself to the surface of the mould, for, if it remain too long, a part of the scoriæ, which separates from the mould, will adhere to the glass. When the glass is covered with the hot ashes, the fire must still be allowed to remain below the mould, lest the glass should crack by being cooled too suddenly. When the glass is taken from the furnace, its convex sides may then be silvered for a burning speculum; or, if a lens is required, two of the pieces of glass may be joined, so as to contain a fluid.

M. Zeisier also constructed burning glasses, by making a concave frame of wood, and covering the concave surface with a paste made of flower, chalk, &c. till it had the requisite degree of curvature. A number of pieces of silverized glass mirrors, about half an inch square, were then fixed upon the concave side, so as to constitute a polygonal reflecting surface.

About the same time that Zeisier was occupied with these pursuits, the celebrated Buffon was engaged in the improvement of burning instruments. This distinguished naturalist directed the whole energy of his powerful mind to this curious subject; and when we say that he has in a great measure exhausted it by the ingenuity of his contrivances, we are not detracting much from the merit of his successors.

Before Buffon began to construct his great mirror, he made a number of preliminary experiments, which are well worthy of being recorded. He found that silvered glass reflected light more powerfully than the best polished metals, even than those which are employed for the specula of reflecting telescopes; — that at short distances, such as four or five feet, only one half of the light was lost by reflection; — that almost no light was lost by being transmitted through 100, 200, and 300 feet of air; — that more of the light of candles was lost by reflection than the sun's light, owing to the greater obliquity of the incident rays; — that the image reflected from a plain mirror six inches square, is at a short distance also six inches square, but afterwards it augments, and then grows deformed, till it at last becomes round at greater distances; — that a plain mirror six inches square loses its square figure at the distance of 60 feet, and one of a foot square at the distance of 120 feet; — that a lens 32 inches in diameter and 6 inches focal length, having the diameter of its focus 8 lines, melted copper in less than a minute, while a small lens 32 lines in diameter, with a focal length of 6 lines, and its focus 3 or 4 of a line, was scarcely capable of heating copper, though the two lenses had theoretically the same burning power, and that a large focus was therefore preferable to a small one, in the fusion of metals. After having determined these preliminary points, Buffon constructed, with the assistance of M. Passemant, a very powerful mirror, which we shall now proceed to describe.

This mirror, which we have represented in Plate CV. Fig. 1., was at first composed of 168 pieces of plain silvered glass, six inches by eight, and having

† No account of this burning glass of Sir Isaac Newton's is given in the Philosophical Transactions; and we are informed, upon very good authority, that no such instrument is in the possession of the Royal Society. Mr Derham, however, a Fellow of the Royal Society, gives the same account which we have followed in the text. See Derham's Astrotheologie, lib. vii. cap. i. Note.
BURNING INSTRUMENTS.

Plate CV.

Fig. 2, 3, 4.

Results obtained with Buffon's mirror.

March 23, 1747, Buffon set fire, at the distance of 66 feet, a plank of tarred beech wood, with 40 mirrors only. In this experiment, the mirror was not put upon its stand, and was therefore very disadvantageously placed, forming with the sun an angle of 20° of declination, and another of more than 10° of inclination.

March 23, 1747. The mirror being still more disadvantageously placed, a plank tarred and sulphured was set on fire at the distance of 126 feet, with 98 mirrors.

April 3, 1747. At 4 o'clock in the evening, when the sun's rays were weak, and his light very pale, and when the mirror was mounted upon its stand, a slight inflammation was produced upon a plank covered with wool cut into small pieces (feuilles haéchée) at the distance of 138 feet, with 112 of the mirrors.

April 4, 1747. At eleven o'clock in the morning, when the sun was very pale and obscured with vapours and light clouds, 154 mirrors at the distance of 150 feet, made a tarred plank smoke to such a degree in two minutes, that it would have been inflamed, had not the sun quickly disappeared.

April 5, 1747. At three o'clock in the afternoon, the sun being more feeble than on the day preceding, 154 mirrors, at the distance of 250 feet, inflamed in 23 minutes chips of fir deal sulphured and mixed with charcoal. When the sun was vivid, the inflammation took place in a few seconds.

April 10, 1747. After mid-day with a clear sun, 128 mirrors, at the distance of 150 feet, set fire to a tarred plank of fir. The inflammation was very sudden, and took place over the whole extent of the focus, which was about sixteen inches in diameter.

April 10, 1747. At half past two o'clock, 148 mirrors, at the distance of 150 feet, set on fire a plank of beech sulphured in some parts, and covered in others with wool cut into small portions. The inflammation, which began in the uncovered part of the wood, was so sudden and violent, that it was necessary to plunge the plank in water in order to extinguish it.

April 11, 1747. TWELVE mirrors at the distance of 20 feet inflamed small combustible matters. TWENTY-ONE mirrors inflamed a plank of beech that had been already partly burned. FORTY-FIVE mirrors at the same distance, melted a large pewter flask that weighed about six pounds. ONE HUNDRED AND SEVENTEEN mirrors melted some thin pieces of silver, and made red hot a piece of sheet iron. By employing all the mirrors, Buffon imagined that he could melt metals as easily at 50 feet distance as at 20.

From a number of subsequent experiments, Buffon ascertained that 40 or 45 feet was the most advantageous distance for making experiments on the metals. The silver plates which he melted at this distance with 224 glasses emitted a most abundant smoke, but as they were very clear, he did not ascribe this smoke to grease or any other substances which they had imbied, as was supposed by some who had witnessed the experiment. When the silver was quite new, it smoked as before, and sometimes for about eight or ten minutes before it was melted.

At a subsequent period, Buffon burned wood at the distance of 200 and 210 feet, when the sun was brilliant, and he melted all the metals and metallic minerals at the distance of 25, 30, and 40 feet. The mirror requires about half an hour to be properly adjusted, so that all the images may coincide; but when the adjustment is completed, the focus will continue unaltered for more than an hour. Buffon's mirrors for burning at small distances.

The attention of Buffon was next directed to the construction of mirrors for burning at short distances. He took circular plates of glass about 18 inches, two feet, and three feet in diameter, and having perforated them at the centre with an aperture two or three lines in diameter, he placed them in a circle of iron that was truly turned. A very fine screw connected with a box stretching across the back of the glass, passed through the hole in the centre into a nut on the other side, so that by turning the screw, the circular piece of flat glass was gradually incuredted, till it formed a concave mirror. The glass of three feet diameter, when it was bent about 4ths of a line, had its focus 50 feet distant, and set fire to light substances; when it was bent two lines, it burned at the distance of forty feet; and when it was bent 2 1/3 lines, its focal length was 30 feet; but in attempting to reduce its focal length to 20 feet, it was broken in pieces. The glass of two feet diameter shared the same fate; but the one of 18 inches, which had a focal length of 25 feet, was preserved as a model of this species of mirror. The accident which happened to the two largest of these mirrors, appears to have been owing to the perforation in the centre. In order to remedy this evil, Buffon proposed to place a circular piece of glass at the extremity of a cylindrical drum, made of iron or copper, and completely airtight. The cavity being exhausted by means of an air-pump, the glass at one extremity would be pressed in by the weight of the atmosphere, and would have its focal length inversely proportional to the degree of refraction. This contrivance is represented in Fig. 5, and a section of it in Fig. 6.

A still more simple and ingenious method of exhausting the air in the drum was contrived by Buffon. He proposed to grind the central part of the plain glass into the form of a small convex glass, and in the focus of this convex portion to place a sulphur match, so that when the mirror was directed to the sun, the rays converuated by the convex portion would inflame the match, which, being set on fire, would absorb the air, and thus produce a partial vacuum, and...
consequently an incurvature of the plain glass. * See Fig. 7. and 8.

Mirrors of this kind, with a moveable focus, were regarded by Buffon as of great use for measuring the effects of the solar rays, when concentrated into foci of different sizes. As the quantity of incident light and heat is nearly the same to whatever curvature the glass is successively bent, we might thus determine the size of focus by which a maximum effect was produced.

Buffon likewise made a number of concave mirrors, by beading plates of glass on moulds of a spherical form. Some of these were so large as 3, 4, 4 feet 6, and 4 feet 8 inches in diameter; but the utmost care is requisite in the formation of those of such a large diameter. After these glasses were moulded to the proper shape in appropriate furnaces, their concave and convex sides were carefully ground so as to be perfectly concentric, and the convex side was afterwards silvered by M. de Bernieres. Out of twenty-four mirrors of this kind which Buffon had moulded, he was able to preserve only three, the rest having broken, either by exposure to the air, or in the operation of grinding. One of these three, which was 46 inches in diameter, was presented to the king of France, and was regarded as the most powerful burning mirror in Europe. The other two were 37 inches in diameter, and one of them was deposited in the Cabinet of Natural History in the Jardin du Roi. Buffon concentrated the rays of the moon by means of the mirror of 46 inches diameter, but, though his thermometer was very sensible, no heat was perceived.

The great defect in the large burning mirror of Buffon, and, indeed, in every combination of plain mirrors, is the difficulty of adjusting each mirror, so as to be always perpendicular to the straight line which bisects the angle formed by the ray of the sun, and the line which joins the mirror and the focus of the paraboloid. The necessary motion might easily be given to all the elementary mirrors, by attaching each of them to a machine resembling the Heliotosta of Gravesande; but the dilatation of its parts, and the shakings to which it would inevitably be exposed, might occasion an agitation in the different images, which would greatly diminish the power of the machine. The only method, therefore, of combining plain mirrors, is to confide each of them to an individual, properly instructed, to keep it in such a position as to reflect the solar rays to a determinate point, and to vary this position according to the motion of the sun. M. Peyrard, however, properly observes, that though this might be easily done by three or four persons, yet, if 100 or 200 individuals were thus employed, none of them could distinguish the image of his own mirror from that of the rest; and, therefore, if a single image were removed from the focus, each of the mirror-holders would naturally wish to know if it was his, and a general agitation and confusion of the images would be the consequence. In order to remedy this inconvenience, M. Peyrard proposes to furnish each mirror with a suitable apparatus, so that, when it is once directed to the point where the images are to be collected, the individual who has the charge of it can always adjust it to the motion of the sun, without looking beyond the apparatus itself.

The apparatus with which each mirror is connected, is represented in Plate CV. Fig. 9, where AB is a common telescope, with only one tube, contain-

ing the object-glass at B, and the eye-glass at A. This tube is moveable on its axis, between the two collars CC, C'C', which are fixed to a piece of metal DD. This piece of metal is supported on a stand like a common telescope, having a vertical and horizontal motion, by which the axis of the telescope may be directed with facility to any given point. The axis of the instrument is marked out by the intersection of a pair of cross wires placed in the anterior focus of the eye-glass; and when this point of intersection is directed to any object, the whole instrument is kept steady in its place by the screws F and G, the former of which prevents any motion in a vertical direction, and the latter in a horizontal direction. From the middle of the tube AB rises a cylindrical piece of metal MM, and upon the eyeglass extremity a branch of iron HH, wrought square, is fixed firmly in a direction parallel to the axis of the cylindrical piece MM.

A plain silvered glass mirror IL, inserted into a proper frame, is made to turn on two pivots, one of which m m rests on the cylinder MM, while the other oo is inserted in the horizontal part of the branch HH. The straight line which passes through the centres of these pivots, must be exactly parallel to the silvered back of the mirror, and at right angles to the axis of the telescope, and the black mark N, produced by a scratch upon the silvered surface, must be bisected by the axis of the mirror.

Above the object end B of the tube is fixed a plate of metal, seen in the figure, and behind this plate is seen another square plate z z, on which are drawn the lines x x, y y, crossing each other at right angles. By means of a piece of brass fixed to the last of these plates, and traversing a square hole made in the other plate, the square plate may be moved up and down, and from right to left; and it is kept in any position which is thus given to it, by a screw on the back of the fixed plate. The moveable square plate must be adjusted in such a manner that the line x x may intersect the axis of the telescope, and be parallel to the axis o m of the mirror. The

* Instead of grinding the central part of the glass plate into a convex form, Zeither suggests that a small burning glass should be applied to insulase the sulphur; or what is still better than either of these plans, a convex lens might be fastened by the balsam of Tolu, or any transparent cement, to the centre of the glass plate.

M. Zeither employed a more effectual method of bending circular plates of glass, than that which was used by Buffon. The circular piece of glass was placed in an iron ring, across which was fixed a thin piece of iron, with a hole containing a female screw, so placed as to be above the centre of the glass. A strong bar of brass was also placed across the centre of the speculum, and a screw working in the centre of this, and in the female screw already mentioned, pressed the thin iron bar against the glass, and bent it into the proper curvature. A plate of Venetian glass, two lines thick and 20 Rhinland inches in diameter, was bent in this way till it protruded two lines in the middle, so as to have a focal length of 15 feet, which was a greater curvature in proportion than any of Buffon's. The glass was kept in this state for several days, without suffering any injury. See Nov. Comment. Petrop. 1758, 1759, p. 250, Note.
BURNING INSTRUMENTS.

The position of the line $yy$ must also be such, that its distance from the axis of the telescope is equal to the distance of the line $IK$ from the same axis.

When the plate $zz$ is thus adjusted, the straight line $yy$ will always be in the same plane with the line $IK$, whatever be the position of the mirror, and a line drawn from a point at $N$, where the axis of the mirror cuts $IK$, to the point where $yy$ intersects $zz$, will be parallel to the axis of the telescope.

The spring $QQ'$ is fixed at $Q$ to the arm $HH$, and by a screw $R$ working into its other extremity, $Q'$, the end $H$ of the horizontal arm may be made to press the pivot $oq$ upon the frame of the mirror.

The horizontal branch $HH$, which is represented separately in Plate CV. Fig. 10, is surrounded with several pieces. The piece $dd$ and pivot $o$ are fixed in an invariable manner. The pivot $oo$ is inserted in a square hole through the piece $VV$, and through the extremity of the arm $HH$. The piece $dd$ may be moved either before or behind, by turning the screw; and the piece $VV$ may be moved from right to left, with the piece $dd$, by means of the screw $S$.

The apparatus being thus constructed, the next thing to be considered is the method of adjusting it. In order to effect this, the axis of the mirror must be perpendicular to the axis of the telescope; the line drawn from a point near $N$, where the axis of the mirror cuts the line $IK$, to the point of intersection of $xx$ and $yy$, must be parallel to $IK$, and the straight line $yy$ must always be in the same plane with $IK$.

The mirror is first placed in such a manner that the line $IK$ is at right angles to the axis of the telescope. By turning the screw $T$, the lower edge of the frame is made a tangent to the circular surface $MM'$, which is parallel to the axis of the telescope. The screw $T$ is then turned, in order to fix the piece $dd$ in an invariable manner.

The axis of the telescope is next directed to a point on a plane surface, placed at a certain distance. This point must be situated in a vertical plane, perpendicular to the plane surface, and passing through the eye of the observer and the centre of the sun. A horizontal line being drawn through this point, a second point is taken, as far from the first as the centre of the mirror is distant from the axis of the object-glass. By unscrewing $S$, turning the telescope on its axis, and the mirror also about its own axis, the piece $VV$ is moved backwards or forwards until the centre of the reflected image falls upon the second point. The square plate $zz$ is then adjusted in such a manner that the shadow of the line $IK$ falls on the line $yy$, and that the shadow of $NN$ is bisected by the line $xx$. When this happens, the plate $zz$ is firmly fixed. Hence it follows, that whenever this adjustment is made, and when the intersection of the cross wires in the telescope is directed to any point, the rays reflected by the mirror will be parallel to the axis of the telescope, and will always continue so while the shadow of $IK$ falls on $yy$, and while the shadow of $NN$ is bisected by $xx$.

In making use of the mirror, the intersection of the cross wires must be first directed to any point of the object which is to be inflamed:—the telescope must next be turned round in the collars $CC$, $CC'$, till the shadow of the line $IK$ falls upon $yy$; and, finally, the mirror must be turned about its own axis till the shadow of $NN$ is bisected by the line $xx$.

The centre of the reflected image will consequently fall upon a point of the object as far distant from the point to which the intersection of the wires was directed, as the centre of the mirror is from the axis of the telescope. The image may obviously be preserved in this position as long as we choose, by keeping the shadow of $IK$ and $N$ in the same position.

In this manner M. Peylard proposes to construct every individual mirror, so that if each of them is managed by one person, and directed to the same point, the heat of the solar beams may be multiplied to any extent. As the motion of the sun, and consequently the change of position in the image, is very slow, one person may direct ten or more of the mirrors, without any injurious enlargement of the focus.

If the object required to be burnt is in motion, each mirror must be managed by two persons, one of whom is constantly employed in directing the intersection of the wires upon the moving object, while the other takes care that the shadows of $IK$ and $N$ shall fall upon their proper places.

The attention of M. Peylard was next directed to the effects which might be expected from any given combination of mirrors; and the following are the data upon which he proceeds. They are derived from the experiments of Buffon.

1. The light of the sun reflected by a plane glass mirror, does not lose more than one half by reflection at short distances.

2. At great distances it loses almost none of its force, from the thickness of the air through which it passes; and,

3. Its force is diminished solely in the inverse ratio of the augmentation of the spaces which the image occupies upon a plane perpendicular to the reflected rays.

From these principles, and from the consideration that the rays reflected from a circular piece of mirror on a line perpendicular to its surface, form a cone whose angle is $32^\circ$ the diameter of the sun, M. Peylard has computed the distances at which the reflected image of a mirror five decimetres in diameter, is doubled, tripled, quadrupled, thus:

<table>
<thead>
<tr>
<th>The image being</th>
<th>The distance in Metres is</th>
</tr>
</thead>
<tbody>
<tr>
<td>Double</td>
<td>22,25</td>
</tr>
<tr>

</tbody>
</table>

If these distances were double, triple, quadruple, the diameters of the mirrors, instead of being five, would be ten, fifteen, twenty, &c. decimetres.

It follows, from the preceding table, that if any
BURNING INSTRUMENTS.

The given combination of mirrors produced a certain degree of heat at a small distance, in order to produce the same degree of heat at the distance of 22.25 metres, double the number of mirrors would be required; at the distance of 39.33 metres, triple the number would be required, and so on.

From an examination of Buffon's experiments, M. Peyrard has obtained the following results, respecting the multiplication of the direct heat of the sun, which is necessary to burn different substances.

1. On the 23d of March, at noon, a plank of tarred beech-wood was set on fire by 4½ times the direct heat of the sun.
2. On the 10th of April, in the afternoon, a tarred plank was set on fire by 4½ times the sun's heat.
3. On the 11th of April, a beech plank, partly burned, was set on fire by 5½ times the sun's heat.
4. On the same day, some small combustible substances were burned by three times the sun's heat.
5. On the same day, a large pewter flask, weighing 6 pounds, was melted by 11½ times the sun's heat.
6. Some thin pieces of silver were melted, and a piece of sheet iron was made red hot, by 29½ times the sun's heat.

7. Silver plates melted with 37½ times the sun's heat.

By supposing that five times the heat of the sun is sufficient to set fire to tarred planks, Peyrard imagines that eight times the sun's heat will be sufficient to set on fire all kinds of wood, and upon this principle he has computed the following table, suited to his own mirrors of five decimetres in diameter.

In order to find the number of mirrors necessary for burning wood at any distance \(d\), we have the following analogy:

\[
x = \frac{\sqrt{53.72^2 + d^2}}{53.72}.
\]

By making the height and breadth of the mirrors double, triple, quadruple, &c., it is obvious that they would inflame wood at double, triple, and quadruple distances. M. Peyrard is of opinion, that with 500 glasses five decimetres in diameter, he could reduce a fleet to ashes at the distance of a quarter of a league; that if they were a metre in diameter, he could produce the same effect at the distance of half a league; and that if they were two metres in diameter, the same result would be obtained at the distance of a league. In this calculation, however, M. Peyrard has completely omitted to take into account the great diminution of effect which must necessarily arise from any deviation in the surfaces of the mirrors, from a perfectly plain figure, and from a want of parallelism in the surfaces. Even if all the mirrors were parallel glasses ground with the same care as those which are used for reflecting instruments, the diminution of effect would be enormous at the distance of a league, as the angular deviation increases exactly with the distance. An experimental proof of this operation may be obtained, by looking into a mirror at different distances. At a short distance the worst mirror will give a tolerable representation of the observer, but as the distance increases, the distortion becomes very great. Even in the finest mirrors that are now made as articles of furniture, we are confident that the image will be very perceptibly distorted at the distance of 30 feet. This cause is, we fear, the most insurmountable obstruction to the process of burning objects at a great distance. By a numerous combination of large mirrors, it may be possible to inflame wood, at the distance of a quarter of a mile; but we think that this is the greatest distance at which effects of this kind will ever be produced.

Having thus given a full account of the various catoptric burning instruments which have been constructed, we shall conclude this part of the article with some general remarks.

In the present state of military science, it is very obvious that burning instruments can never be employed as an engine of war; and therefore any attempt to construct mirrors for burning at a distance must be considered more as a matter of curiosity than of use. The formation of instruments, however, for burning at short distances, is a subject of the first importance to science; and we have no doubt that they will, some time or other, be employed as the most powerful agents in chemistry and the arts. Though catoptric burning instruments of great power have been constructed, yet their effects have never been so great as those of lenses, and they are besides liable to numerous disadvantages. The burning point must evidently lie between the centre of the mirror and the sun; and therefore the operator cannot so easily perform his experiments as when the focus lies on the other side of the instrument. All his operations, indeed, have a tendency to obstruct the light before it falls upon the reflecting surface. This evil will not admit of a remedy, and consequently we must have recourse to instruments of a dioptric or catadioptric nature, which are alone capable of uniting great power with great facility of management.
There is reason to believe that the ancients were acquainted with the use of burning lenses, though the information upon this point which has been conveyed to our times is extremely trifling. All that we know on the subject, indeed, is contained in Pliny and Laeotantius. The former of these authors mentions globes of glass and crystal, which, when exposed to the sun, burnt the clothes and flesh on people's backs; and Laeotantius observes, that a sphere of glass filled with water, and held in the sun, lighted the fire, even in the coldest weather.

The first burning lenses of any magnitude were constructed by M. Taschinhausen. They were three and four feet in diameter; their focal length was about twelve feet, and the diameter of the focal image about an inch and a half. In order, however, to increase the force of the solar rays, the light refracted by the large lens was received upon a lens of a smaller size, which converged them to a point nearer the large lens than its principal focus, and had a focal image of only 8 lines in diameter. The large lens, which weighed 160 pounds, was purchased by the Duke of Orleans, and presented by him to the French Academy. As its effects were extremely powerful, we shall give them at some length.

1. All sorts of wood, whether hard or green, and even when wet, were burnt in an instant.
2. Water in a small vessel boiled immediately.
3. All the metals, when the pieces were of a proper size, were easily melted.
4. Tiles, slates, delft ware, pumice stone, talc, whatever was their size, grew red and vitrified.
5. Sulphur, pitch, and resins, melted under water.
6. When the metals were placed in charcoal, they melted more readily, and were completely dissipated.
7. The ashes of wood, vegetables, paper, and cloth, were converted into a transparent glass.
8. All the metals were vitrified upon a plate of porcelain. Gold received a fine purple colour.
9. Substances that would not melt in pieces were easily melted in powder; and those that resisted the heat in this form, melted by adding a little salt.
10. A substance easily fused assists in melting more refractory substances when placed along with them in the focus; and it is very singular, that two substances which are very difficult to melt separately, are very easily melted when exposed together, such as flint and English chalk.
11. A piece of melted copper being thrown suddenly into cold water, produced such a violent concussion that the strongest earthen vessels were broken to pieces, and the copper was thrown off in such small particles that not a grain of it could be found. This did not happen with any other metal.
12. All bodies except the metals lose their colour. The precious stones are instantly deprived of it.
13. Certain bodies vitrify easily, and become as transparent as crystal; but by cooling they grow as white as milk, and lose all their transparency.
14. Other bodies, that are opaque when melted, become beautifully transparent when they are cooled.
15. Substances that are transparent, both when melted and cold, become opaque some days after.

16. Substances which the heat renders at first transparent, but which afterwards become opaque by being melted with other substances that are always opaque, produce a beautiful glass, always transparent.
17. The rays of the moon concentrated by this lens, though extremely brilliant, have no heat.

M. de Buffon, whose burning mirrors have already been noticed, directed his attention also to the construction of burning lenses. His first object was to form burning glasses, by combining two circular segments of a glass sphere, so as to form a lenticular cavity to be filled with water. These glass segments were first moulded into their proper shape, and then regularly ground on both sides, so that the concave and convex surfaces were exactly parallel. The one which he constructed was 37 inches in diameter, with a focal length of about 5 feet and a half, and the segments were of considerable thickness, to prevent them from breaking or altering their form by the weight of the included water. As the refractive power of water is very small, Buffon proposed to increase it by saturating it with salt; but notwithstanding every precaution, he found that the focus of lenses of this kind was never well terminated, nor reduced to its smallest size, and that the different refractions which the rays sustained, produced a very great degree of aberration. Buffon also proposed to make each segment consist of a number of smaller segments put together into a frame; but as the water could not easily be prevented from insinuating itself between the joints of the segments, and as there would be a great difficulty in arranging them in the same spherical circumference, this kind of burning glass does not seem to have ever been executed.

In order to avoid the great thickness of glass at the centres of large convex lenses, Buffon has proposed a very ingenious contrivance. Instead of making the burning lens of one piece of glass, he proposes to form it of three concentric circular pieces resting upon each other. Thus if the whole diameter of the lens is to be 24 inches, which would require a central thickness of three inches if it were of solid glass, the middle part will be a lens 8 inches in diameter, with a thickness of 1 inch. This lens is inserted in the middle of a circular zone, whose diameters are 8 and 16 inches, and this circular zone is again inserted in the middle of another circular zone, whose diameters are 16 and 24 inches. The surfaces of the lens and of the two zones are all ground to the same radius; so that when they are placed together, the solar rays will be refracted to one focus, in the very same manner as if they had fallen upon a lens 24 inches in diameter. The great advantages which are gained by this construction, is the diminution of the quantity of glass, as it does not require half as much as is necessary in lenses of one piece. In consequence of this diminution of thickness, the power of the lens is remarkably increased. The rays which fall upon the central parts, instead of being absorbed by the great mass of glass through which they had to pass, will be transmitted through the lens of 8 inches, and will be twice as powerful as if they had been refracted by a similar portion of a solid and continuous lens.

The next burning lens of any magnitude was constructed by M. Bernieres for M. Trudaine de Mon.
tigntly, an honorary member of the Royal Academy of Sciences. This gentleman, whose liberality and zeal deserve to be recorded, engaged to be at the expense of a large burning glass, formed under the direction of several commissioners named by the Academy. This lens consisted of two spherical segments 8 feet radius and 8 lines thick. The lenticular cavity was 4 feet in diameter, and 6 inches and 5 lines thick at the centre, and was filled with spirits of wine, of which it held no less than 140 pints. The focal length of a zone at the circumference, about 6 or 7 lines broad, was 10 feet 0 inches and 6 lines, the focal length of a portion at the centre, about 6 inches in diameter, was 10 feet 7 inches and 5 lines, and the diameter of the focus was 14½ lines. When the whole surface was covered, except a zone at the circumference of 6 or 7 lines, the following were the foci of the different rays:

The following experiments were made in October 1774, in the Jardin de l'Infante, by M. M. Trudaine, Macquer, Cadet, Lavoisier, and Brisson, the commissioners appointed by the Academy.

1. The burning power of the anterior half of the lens was much greater than that of the exterior half.

2. On the 5th of October after mid-day, the sky not being very clear, two farthing, placed upon charcoal, were completely melted in half a minute.

3. In order to melt forged iron, it was found necessary to concentrate the rays by a second lens 8½ inches diameter, 22 inches 8 lines in focal length, and placed at 8 feet 7 inches from the centre of the great lens. At this place, the cone of rays was 8 inches in diameter, and the burning focus, now reduced to 8 lines in diameter, was 1 foot from the small lens.

4. In the focus of the small lens, upon a piece of hollow charcoal, small pieces of forged iron were placed, which were instantly melted. After fusion, the metal bubbled up, and fumed like nitré in fusion; and then sent off a great number of sparks. This effect (which was observed during the experiments with Tschirnhausen's lens) always took place after the fusion of iron, forged iron, or steel.

5. In order to try the effect upon greater masses, pieces of forged iron, and the end of a nail, were exposed to the focus, and were melted in 15 seconds. A piece of nail, 5 lines long and ¾ of a line square, which was added to the rest, was instantly fused, and the same was the case with a screw that had a round head, and was 8 lines in length.

6. Some days afterwards, a bar of steel, 4 inches long, and 5 lines square, was exposed, so as to receive the focal image upon the middle of its length. This part was completely melted in 5 minutes, after having begun to run at the end of the second minute.

7. Platina, in grains, appeared to draw together, to diminish in bulk, and to prepare for fusion. A little after, it bubbled up and smoked. All the grains were united into one mass, without however forming a spherical button like other melted metals. After the platina had undergone this semi-fusion, it was not attracted by the magnet as it was before the operation.

8. A portion of platina, deprived of the iron which it contained, and therefore not affected by the magnet, lost a part of its bulk, smoked, and formed one mass, which was extended under the hammer.

9. Several experiments were made, in order to find the lens that was most proper for collecting the rays after refraction by the large lens. A spirit of wine lens 2 feet in diameter and 4 feet focus, a solid lens 18 inches diameter and 3 feet focus; and another 13 inches in diameter, were successively tried, but none of them produced such a powerful effect as the lens 8½ inches in diameter, and 22 inches and 8 lines focus, though it was full of vesicles and striæ.

Messrs Cadet and Brisson made a number of experiments on the refractive power of different fluids, by inclosing them in the lens of M. Trudaine, and observing the variations in its focal length. The object of their experiments was to find a fluid that possessed a greater refractive power than spirits of wine, and was at the same time sufficiently cheap and transparent to be used between the glass segments. Liquid turpentine was the most refractive fluid that they employed; but as they found that its dispersive power was to that of crown-glass as 34 to 28, this fluid was obviously, on this account, unfit for the purpose.

The fluid which they preferred was a saturated solution of sal ammoniac or distilled water.

The most powerful burning-glass that has yet been constructed, was made by Mr. Parker of Fleet-street.

After a great number of experiments, and an expence of above L.700, this able artist succeeded in completing a burning lens of flint-glass three feet in diameter. This powerful instrument is represented in Plate CVI. Fig. 1. The large lens, which is placed in the ring at A, is doubly convex, and when fixed in its frame, it exposes a surface of 2 feet 8½ inches. It is 3½ inches thick at the centre; its focal distance is 6 feet 8 inches; the diameter of the burning focus one inch; and the weight of the lens 212 pounds. The rays that were refracted by this lens, were received (according to the method of Tschirnhausen) upon a second lens B, whose diameter is 16 inches out of the frame, and 13 inches in the frame; its central thickness is ¼ of an inch. The length of its focus is 29 inches, the diameter of the focal image being 2 feet.

---

* Messrs Macquer and Beaume are said to have melted small grains of platina by a concave glass, 22 inches in diameter, and 28 inches focus.

† Cadet and Brisson, in the course of their experiments, were led to the discovery of achromatic fluid object-glasses, a discovery which has hitherto been referred to a much later date. This discovery is most distinctly contained in the following passage. "Comme la térébenthine cause un dispersion de rayons assez différente de celle que cause le verre, comme nous, nous en sommes sûrs par l'expérience, ne pourroit on pas faire des objectifs dans lesquels, pour les rendre achromatiques, on feroit usage de cette résine, a la place du flint-glass, matière il difficile a se procurer d'une densité uniforme, et sans défauts, surtout en grands morceaux, mais le développement de cette idée nous monèroir trop loin, et ne fut pas partie de notre sujet actuel!"

* Mémo. Acad. Par. 1777, p. 531.
A diamond of 10 grains, when exposed to the lens for 30 minutes, was reduced to 6 grains. It opened, foliated, and emitted whitish fumes, and when again closed, it bore a polish, and kept its form.

Gold retained its metallic state, though exposed for many hours.

The specimens of platina were in different states of approach to a metallic form.

Copper did not lose any of its weight after an exposure of three minutes.

Iron steel shear melted first at the part in contact with the charcoal, while the other part exposed to the focus was unfused.

Iron scoria melted in much less time than the turnings of iron.

Cals of iron from vitriolic acid, precipitated by mild fixed alkali, weighed 5 grains before exposure, and 5½ after it.

The remains of regulus of zinc, after it had melted and was nearly evaporated, were magnetic.

Regulus of cobalt was completely evaporated in 57°.

Regulus of bismuth, exposed in charcoal, was nearly evaporated—in black lead it began to melt in 2°, and was soon after completely fused: Iron, on exposure of 180°, lost only half a grain; when placed on bone ash, it fused in 2°.

Regulus of antimony, 33 grains, on charcoal, were fused in 3°, and 11 grains only remained after 195°.

Fine kears from the cannon foundry evaporated very fast during 120°, and 30° afterwards, the remainder flowed in globules, which were attracted by the magnet when cold.

Crystal pebble of North America, five grains, contracted in 15°, were perfectly glazed in 135°, ebulliosed in 150°, and became of a slate colour, and semitransparent.

Agate, oriental flint, cornelian, and jasper, were rendered externally of a glossy form.

Garnet, placed upon black lead fused in 120°. It became of a darker hue, lost one-fourth of a grain, and was attracted by the magnet. Ten cut garnets from a bracelet run into one another in a few seconds.

Mr Wedgewood's pyrometrical clay run into a white enamel in a few seconds. Other seven kinds of clay sent by that gentleman were vitrified.

Limestone was sometimes vitrified and sometimes agglutinated. A globule from one of the specimens flew into a thousand pieces when put into the mouth.

Stalactites zeolithus spatulosus, nine grains, took a globular form in 60°. The globule began to become clear in 143°. It became perfectly transparent in 155°. When cold, its transparency diminished, and it assumed a beautiful red colour.

Lavas and other volcanic products likewise yielded to the power of this lens.

In the year 1802, Sir Joseph Banks, Dr Crawford, and some other members of the Royal Society, were present at an experiment for concentrating the lunar rays; but though the most sensible thermometers were applied, it was rather thought that there was a diminution than an increase of heat.

It was not to be expected that this powerful lens, which cost such a large sum of money, could have been retained in the hands of Mr Parker. That ingenious artist was naturally desirous to indemnify himself for the expense of its construction. A subscription was therefore opened for purchasing the lens, as a national instrument; but, to the disgrace of our country, this subscription completely failed, and Mr Parker was induced to sell it to Captain Mackintosh, who accompanied Lord Macartney to China. This valuable instrument was left at Pekin, where it remains a monument of Chinese ignorance, and British parsimony.

From the history which we have now given of dioptric burning instruments, it evidently appears, that in every construction which has yet been proposed, a
BURNING INSTRUMENTS.

Limit is necessarily put to the magnitude, and consequently to the power of burning lenses. The extreme difficulty of procuring glass proper for a large solid lens; the trouble and expense of casting it into a lenticular form without faults and impurities; the great increase of central thickness which becomes necessary by increasing the diameter of the lens; the enormous obstruction which is thus opposed to the transmission of the solar rays; and the augmented aberration which dissipates the rays at the focal point; are almost insuperable obstacles to the construction of a solid lens of a size larger than that of Mr. Parker.

Buffon, indeed, has very ingeniously removed one of these difficulties, by his proposal to construct the lenses of three concentric zones. The quantity of glass is obviously diminished by this contrivance, and the obstruction of the rays in passing through the central portions of the lens is greatly lessened; but the outer circular zone must still contain as much glass as the corresponding zone in the solid lens, and must be nearly as difficult to cast and grind as if it formed a part of the whole lens.

In order to remove these evils, and at the same time to diminish the expense and simplify the construction of dioptric burning instruments, the following construction has been proposed by Dr. Brewster.

If it be required, for example, to construct a burning lens 4 feet in diameter, it should be composed of different pieces, as represented in Plate CVI. Fig. 2, where ABCD is a lens of flint glass, 18 inches in diameter. This lens is surrounded by several segments, AGID, AGE, BDEL, CLID, ground in the same tool with ABCD, but so formed with respect to their thickness at AB and GE, &c., that they may exactly resemble the corresponding portions of a solid lens. These different thicknesses can be easily calculated, and there is no difficulty in giving the segments their proper form. This zone, consisting of separate segments, is again surrounded with other segments, GNOF, FOEP, PEMQ, QMLR, RLKS, SKIT, THIV, VHGN, each of which is six inches broad in the direction of the radius. The section of this lens is represented in Fig. 3, where DE is the central portion, DCn, EoF the second zone, and CAm, FBp the external zone. One of the segments is shewn separately in Fig. 4. By this combination of segments, a lens four feet in diameter will be formed, and will obviously possess the same properties as if it consisted of solid glass. The advantages of this construction may be very shortly enumerated.

1. The difficulty of procuring a mass of flint glass proper for a solid lens, is in this construction completely removed.

2. If impurities exist in the glass of any of the spherical segments, or if an accident happens to any of them, it can be easily replaced at a very trifling expense. Hence the spherical segments may be made of glass much more pure and free from flaws and veins than the corresponding portions of a solid lens.

3. From the spherical aberration of a convex lens, the focus of the outer portion is nearer the lens than the focus of the central parts, and therefore the solar light is not concentrated in the same point of the axis. This evil may, in a great measure, be removed in the present construction, by placing the different zones in such a manner that their foci may coincide.†

4. A lens of this construction may be formed by degrees, according to the convenience and means of the artist. One zone, or even one segment, may be added after another, and at every step the instrument may be used as if it were complete. Thus, in Fig. 2, the segment NVW may be added to the lens without the rest of the zone to which it belongs, and it will contribute, in the proportion of its area, to increase the general effect.

5. If it should be thought advisable to grind the segments separately, or two by two, a much smaller tool will be necessary than if they formed one continuous lens. But, if it should be reckoned more accurate to grind each zone by itself, then the various segments may be easily held together by a firm cement.

6. Each zone may have a different focal length, and may therefore be placed at different distances from the focal point if it is thought proper.

In the construction of burning lenses, whether they consist of one solid piece, or of a number of zones and segments, a limit is necessarily put to their magnitude. As we increase the diameter of these lenses, the surface of the outer zone has a more oblique position towards the incident rays, and, consequently, a greater number of them are reflected from that surface. When this obliquity amounts to 47° or 48°, the whole of the incident light is reflected, and, therefore, a zone of this obliquity becomes totally useless. The diameter of burning lenses can never exceed the chord of an arch of 47° or 48° of the sphere to which it has been ground; and when the diameter approaches to this limit, the outer zone contributes very little to the general effect. In order to surmount this difficulty, we must have recourse to Catadioptric Instruments.

ON CATADIOPTRIC BURNING INSTRUMENTS.

In order to construct a burning instrument which on catadiptical burning instruments, we must combine the principles both of reflection and refraction. We are not aware that any instrument of this kind has ever been proposed; and we are the more surprised at this, as the proper combination of lenses and mirrors must naturally suggest itself to any one who considers the limits which are set to the construction of single lenses, and the disadvantages, either of a theoretical or a practical nature, to which they are liable.

This instrument, which has been proposed by Dr. Brewster, and which may be properly called a burning sphere, from the arrangement of the lenses, is represented in Plate CVI. Fig. 5. which is merely a section of the sphere, and represents only five of the lenses, and four of the mirrors. The lenses A, B, C, D, E, which may be of any diameter and focal length, are so placed in the spherical surface AMN, that their principal foci exactly coincide in the point F. If any of the lenses have a different focal length, or if the spurious image, which has been removed, and is therefore at a greater distance from the lens than the luminous focus.
from the rest, the coincidence of its focus with that of the other may be easily effected by varying its distance from F. The whole spherical surface, whose section is AMN, except a small opening for admitting the object to be fused, may be covered with lenses, having all their foci coincident at F; though it will, perhaps, be more convenient to have the posterior part MN without lenses, and occupied by a mirror of nearly the same radius FA as the sphere. The object of this mirror, is to throw back upon the object at F the light that passes by it, without producing any effect. Each of the lenses, except the lens A, is furnished with a plane glass mirror, which may be either fixed to the general frame of the sphere, or placed upon a separate stand. When this combination is completed, the sphere is exposed to the sun, so that its rays may fall at right angles upon the lens A, which will, of course, concentrate them at F, and produce a pretty intense heat. The plane mirror PQ, when properly adjusted, will reflect the sun's light perpendicularly upon the lens B, by which it will be refracted accurately to the focus F, and produce a degree of heat fully one-half of what was produced by the direct refracted rays of the sun through the lens A. A similar effect will be produced by the mirror RS and lens D, the mirror TU and lens C, the mirror VW and lens E, and by all the other mirrors and lenses which are not seen in the section. The effect may be still farther increased by the addition of a large lens at XX. As the angle which the surface of each mirror forms with the axis of its corresponding lens is a constant quantity, the mirrors may be all fixed to the general frame of the sphere, and therefore the only adjustment which the instrument will require, is to keep the axis of the lens A parallel to the direction of the solar rays.

In order to estimate the advantages of this construction, let us compare its effects with those of a solid lens, which exposes the same area of glass to the incident rays.

1. In the burning sphere, almost the only diminution of light is that which arises from reflection by the plane mirrors, and which may be estimated pretty accurately at one half of the incident light; but this loss can be amply compensated by adding a few more lenses.

2. In the solid lens, a great diminution of light arises from the thickness of the central portions, and from the obliquity of the parts at the circumference; which, we conceive, will be fully equal to the light lost by reflection in the burning sphere.

3. In the burning sphere, the lenses may be obtained of much purer glass than can be got for a solid lens; and therefore, ceteris paribus, they will transmit more light.

4. Owing to the small size of each lens in the burning sphere, the diminution of effect arising both from spherical aberration and from the aberration of colour, will be very much less than in the solid lens.

5. In the burning sphere, the effect is greatly increased, in consequence of the shortness of the focal length of each lens, and the greater concentration of the incident light.

6. In the burning sphere, all kinds of lenses may be combined. They may be made of any kind of glass, of any diameter, and of any focal length; and the lenses belonging to different individuals may be combined for any occasional experiment, in which a great intensity of heat is requisite.

In the application of the preceding principle to a portable instrument, the different mirrors may be all cemented together, so as to form the frustum of a pyramid, having as many planes as there are lenses surrounding the central lens. A section of this pyramid is shown in Fig. 6., and a plan of it in Fig. 7.

Each plane glass which composes the pyramidal mirror is so placed as to reflect the incident rays upon the lens B or C which is adjacent to it; while the central lens A converges to the same focus as the rest the direct light of the sun which traverses the axis of the pyramid. Thus in the plan, Fig. 7., the direct light of the sun falling upon the lens A, is refracted to the focus \( \phi \), in Fig. 6.; the light which falls upon the mirror \( B \), is reflected perpendicularly upon the lens \( b \), which refracts it to the same focus \( \phi \); the light which falls upon the mirror \( C \), is reflected upon the lens \( c \), and so on with the rest; so that a whole column of rays, nearly equal in magnitude to the polygonal surface BCDEFG, Fig. 7., is concentrated to one point \( \phi \). Instead of the glass mirrors, a conical frustrum of tin or of silvered copper might be advantageously employed.

BURNLEY, a market town in Lancashire, stands on a peninsula, formed by the rivers Colder and Brown, 213 N. of London, and at a small distance from the Leeds and Liverpool Canal. Some considerable manufactories of linen and cotton are established on the adjacent rivers; and the vicinity abound with excellent pit-coal and quarries of freestone, flags and slate. It has a handsome chapel of ease, and two dissenting meeting-houses. There are five annual fairs held in Burnley, and a weekly market on Monday. Number of houses 682, inhabitants 3805, of whom 940 are employed in trade and manufactures. (p)
BURNS, ROBERT, a distinguished Scottish poet, was born on the 25th of January 1759, in a small house about two miles from the town of Ayr, and within a few hundred yards from "Aiton's old haunted kirk," which the poet has rendered so famous in his Tam o' Shanter. His father was a small farmer and gardener, and overseer to Mr Ferguson of Dunholm. Burns was sent, in his sixth year, to a school at Alloway Mill, about a mile distant; but was soon after placed under a young schoolmaster of the name of Murdoch, whom his father, poor as he was, engaged, in conjunctiun with some neighbours, to instruct their families, and live at their houses in rotation. This teacher seems to have had an amiable ambition to cultivate the talents of his pupil, though he had little anticipation of his fame: he taught him English grammar, a circumstance of great importance to Burns, in facilitating his correspondence and conversation with persons of superior education at a subsequent period of his life. In 1767, Burns's father quitted the birth place of our poet, and took a farm at Mount Oliphant, a change of residence which made his attendance at Murdoch's school more irregular; and at the end of two years and a half from the commencement of his tuition, Murdoch quitted the place for a different appointment. Burns was thus left with no other instructor than his father, at the farm of Mount Oliphant; but the venerable rustic seems to have done all that lay in himself for the education of his family. He taught them arithmetic by their solitary evening candle, and borrowed for them some useful books, such as Sallou's Geographical Grammar, Derham's Physico and Astrotheology, and Ray's Wisdom of God in the Creation. He was also a subscriber to Stackhouse's History of the Bible. Whatever interests us in the Bible, (and there is nothing which interests a young and curious mind so much as elucidations of its history), is, independent of all influence on morals—a most valuable guide to good taste. In tracing the education of Burns, (an education interesting, because it is scanty,) this early direction of his mind to the sacred writings is a prominent circumstance.

About the age of 13, he was sent for a week at a time, alternately with his brother, to the parish school of Dalrymple, during a summer's quarter, to improve his hand-writing. The following summer, as his faithful friend Murdoch had been appointed to the English school at Ayr, he was boarded with him for three weeks, to revise his English grammar, and to acquire a little French. Wonderful it is, that, during a fortnight's instructions in the latter language, he was enabled to translate it in prose. This seems to have been all his accomplishment in French; yet it is the only instance of his manly and modest nature being betrayed into vanity, that he piqued himself so much upon it, as to affect French phrases, when broad Scotch would have served him better. He even sometimes tried to speak it. On one occasion, when he called in Edinburgh at the house of an accomplished friend, a lady who had been educated in France, he found her conversing with a French lady, to whom he was introduced. The French woman understood English; but Burns must try his powers. His first sentence was intended to compliment the lady on her apparent eloquence in conversation; but by mistaking some idiom, he made the lady understand, that she was too fond of hearing herself speak. The French woman, highly incensed, replied, that there were more instances of vain poets than of talkative women; and Burns was obliged to use his own language in appeasing her.

He made a slight attempt to learn Latin, but did not persevere. Upon the whole, the instructions already mentioned, with a quarter's attendance, at the age of 13, in geometry and surveying, and a few lessons at a country dancing school, form the history of Burns's education. From the books which he read during that period, he had imbibed a mattering of history and philosophy; but till the time of his becoming an author, his brother assures us, that he was imperfectly, or not at all acquainted with our most eminent English authors. We have been thus minute in noticing the history of our poet's mind, because his education has been sometimes as over-rated, as under-rated. It has been said to be equal to that of Shakespeare. If the education of a poet means that reading which shall best inspire a poet, we beg to say, with deference to the high authority which we contradict, that his reading must have been infinitely inferior to that of Shakespeare. The great ancient poet lived in an age overflowing with chivalrous and romantic books, the richest food for the imagination; in an age, too, when translations were sought with more avidity; translations which Shakespeare must have perused incessantly, from his business of writing for the stage.

But the youth of Burns was depressed by circumstances still more dispiriting than want of education. His father was unfortunate on the farm of Mount Oliphant. The family lived in a state of toil and poverty; for several years, butcher's meat was a stranger in their house, and Robert, who was the eldest, threshed in the barn at 13 years of age, and at 15 was the principal labourer on the farm. To this scanty diet, and exhaustion of strength, aggravated by the prospect of still deeper family distress from the declining health of his father, his brother ascribes the melancholy and nervousness which fixed on his constitution, and eventually drove him to baseless reliefs. "This kind of life (he says), the cheerless gloom of a hermit, and the increasing moil of a galley slave, brought me to my 16th year, a little before which period I first committed the sin of rhyme." The object of his first attachment was Mary Campbell, a simple Highland girl, his fellow-reaper in the same field. He was separated from this early idol of his attachment by the poverty of circumstances, which did not allow to either of them a choice of residence, or an opportunity of meeting after separation. His heart was not so tenacious of attachment as that of Petrarch, (though his poetry speaks a more sincere language,) and we find him changing its object of idolatry several times before his marriage. But if he was too honest to boast of unvaried fidelity, he was too faithful to his first love.
to hear of the death of Mary, without the sincerest agitation. He was a married man when he received the news. He entreated his wife Jane to sing to him all the tenderest airs, which she knew had power to solace his spirits in a state of emotion; after which, he withdrew himself, and for several hours gave way to a flood of tears, and the deepest paroxysms of grief. After he was calmed, he wrote his Address to Mary in Heaven, a most exquisite effusion.

His father removed from Mount Oliphant to a neighbouring farm, called Lochiel, and there Burns continued from his 17th to his 24th year. In his 23rd year, he attempted to settle himself in business as a flax-dresser in the neighbouring town of Irwin; but his shop took fire one unhappy evening, when he was celebrating the welcome of the new year with a carousal, his stock was consumed, and he was not so fond of the trade as to attempt obtaining credit for a new adventure. His father died soon after, and his all went to his creditors; but the family contrived to collect some money among themselves, and entered on the neighbouring farm of Mossgiel. Robert now said to himself, “Come go too, I will be wise;” he read farming books, calculated crops, and attended markets; but neither this purpose wisdom of the poet, nor the steady sagacity of his brother Gilbert, could avert misfortunes. The soil of their farm was unimprovable, and a succession of bad crops obliged them to abandon it, with great loss of stock, at the end of four years. During this period, Burns had become known in the neighbourhood as a maker of rhymes. A satire on the Calvinistical clergymen of the place had met with applause, not only from the laity, but from a certain description of the clergy, who relished humour. Holy Willie’s Prayer next made its appearance, and alarmed the kirk-session so much, that they held several meetings to consult on taking vengeance on the author. “Unluckily for me (says the poet), my wanderings led me on another side, within point blank shot of their heaviest metal.” He alludes to the church censure, which he was obliged to undergo for his connexion with Jane Armour, afterwards his wife,—a connexion which could no longer be concealed at the time, when he was forced to quit his farm, and had resolved to push his fortunes on the other side of the Atlantic. For want of money to procure his passage to Jamaica, he had thought of indenting himself as a servant. From this necessity he was extricated, by publishing his Poems at Kilmarnock: he reaped from them a temporary supply, but not sufficient for the present to set aside his thoughts of emigration. In the mean time, his pride and affections were wounded almost to distraction, by the consequences of his amours. He loved the partner of his disgrace very tenderly, and, as all the atonement he could offer to her, made a private marriage with her. But his affairs being still in a hopeless state, he could form no other arrangement, than that he should leave her behind him at her father’s, a substantial farmer, proposing, whilst he pushed his fortune in Jamaica, that they should trust to better circumstances for their re-union. The parents of Jane were, however, more sensible to the misfortune of her having a husband so far removed, than to the disgrace of her having children without the name of a wife, and persuaded her to renounce the marriage, which was informal. Burns, though he sufficiently proved his honour, by marrying her in his prosperity, consented that she should renounce him in his adversity. But, amidst the distraction and gloom of his prospects, the fame of his poems had made a rapid progress. A letter from Dr Blacklock induced him to repair immediately to Edinburgh, after his chest was on the road to the port from which he was to sail, and after he had composed his farewell song to Caledonia. The reception which he met with in his native capital is well known, as the impression which he made by the interesting powers of his conversation is still remembered by many. He possessed, with all his practical folly and misconduct, a quick and almost intuitive power of reading human character. His manners, when he came to Edinburgh, are thus described by Professor Stewart: “They were then, as they continued ever afterwards, simple, manly, and independent,—strongly impressive of conscious genius and worth, but without any thing that indicated forwardness, arrogance, or vanity. The attentions which he received in Edinburgh were such, as would have turned any head but his own. I cannot say that I perceived any unfavourable effect which they left upon his mind. He retained the same simplicity of manners and appearance which struck me so forcibly when I first saw him in the country. From his conversation, I should have pronounced him to be fitted to excel in whatever walk of ambition he had chosen to exert his abilities.”

Among the first encouragers of Burns’s genius was the Earl of Glencairn,—if he had lived longer, and if his power had equalled his wishes, Scotland (as his biographer remarks) might have still exulted in the genius, instead of lamenting the early fate of his bard. But unhappily at this period, Edinburgh contained an uncommon proportion of men of considerable talents, but devoted to social excesses. Burns was as much beset, by the importunity of those admirers of his genius to share his society, as impelled by the vehemence of his character to indulge in their orgies. The sudden alteration in his habits of life, operated on him physically as well as morally. The humble fare of an Ayrshire peasant he had exchanged for the luxuries of the Scottish metropolis; and the effects of this change on his constitution could not be insensible. He saw his danger, and at times formed resolutions to guard against it; but he had embarked on the tide of dissipation, and was borne along its stream.

The profits of a new edition enabled him, in the year after his arrival in Edinburgh, (1787,) to make the tour of a considerable extent of Scotland. He visited the tomb of Bruce, and knelt at it with characteristic devotion. Unhappily for his habits, he returned to Edinburgh, and spent there the winter of 1787—8. His visit seems to have been without any serious object, and consumed some portion of his capital, which would have been much better bestowed on stocking a farm, than in renewing his round of dissipation. He probably looked, however, to some
permanent provision from the extensive patronage which he nominally enjoyed. A provision was, indeed, at last made for him; but it was a miserable provision,—the place of an exciseman, an office which condemned him to the haunts of smugglers and the society of publicans. Burns humorously expressed his consolation for the lowness of his corps and comrades, by comparing it to the encouragement which he had heard held out by a recruiting sergeant to some young soldiers: "Gentlemen, you have enlisted in the most blackguard corps in his majesty's service; if there is an honest man among you, he is sure to make his fortune in the regiment."

He now took a farm on the banks of the Nith, built himself a house with his own hands, and settled in conjugal union with his Jane. But here his unhappy distraction between two businesses, and the journeys which he was obliged to take in his profession as an exciseman, had so bad an effect on his farming pursuits, that, at the end of three years and a half, he found it convenient, if not necessary, to resign the one. His office in the excise had originally produced about fifty pounds per annum. Having acquitted himself to the satisfaction of the board, he was appointed to a new district in Dumfriesshire, worth about seventy pounds per annum; and he settled in Dumfries in 1791. Hitherto, although addicted to excess in company, Burns had abstained from the habitual use of spirituous liquors; but in Dumfries new temptations presented themselves to "the sin that so easily beset him." His life was embittered also by the political persecution (for it can be called nothing else,) which he suffered for expressing the independent principles of a friend to liberty. Information of some unguarded expressions, which he had used in private conversation, was sent to the board of excise, and he was prevented from being cast out of bread and support, only by the interposition of his steady friend Mr Grahame of Fintry.

In the winter of 1795, his constitution, broken by cares, irregularities, and passions, fell into premature decline. The summer returned, but only to shine on his sickness and his grave. In July his mind wandered into delirium, unless roused by conversation; and in that month a fever, on the fourth day of its continuance, closed his life and suffering, at 37 years of age.

Burns was, in his person, about five feet ten inches high, of a form that indicated strength as well as agility; his forehead was finely raised, indicating extensive capacity; his eyes were large, dark, full of ardour, and intelligence; his character, though marred by imprudence, was never contaminated by duplicity or meanness.

As a poet, without accomplishing any work of extensive or complicated design, he has exhibited all the variety of poetical powers which can enter into the greatest works, the conduct of a plan only excepted. The English reader is alive to the force and feeling of many of his passages; but the Scottish reader perceives also, that he is as much a master of the ludicrous and familiar, as of the strong and pathetic. His humour in delineating Scottish character and manners, unfortunately for his name, depends upon a language which is fast expiring; but as long as it remains intelligible, the gaiety and the unadorned charm of his pictures from rustic life, will be deeply felt by his countrymen, and will, in all probability, be studied by glossaries, as Chaucer's able pictures of English life are now studied by the English scholar. As a poet, he is superior in force to Ramsay; his humour is of a richer vein than that of either Ramsay or Ferguson, both of whom, as he himself informs us, he had frequently in his eye, but rather with a view to kindle at their flame than to servile imitation. Ferguson's Farmer's INgle, which may be considered as a Scottish pastoral, was certainly the archetype of his Cotter's Saturday Night.

The picturesque simplicity of the former is not only caught by Burns, but it is elevated by touches of tenderness and sublime devotion unknown to Ferguson. The description of these humble cottagers forming a wider circle round their hearth, and uniting in the worship of God, is a picture, as Dr Currie has observed, the most deeply affecting of any which the rural muse has ever presented. Such poetry (it is well added by the same critic,) is not to be estimated by the degree of pleasure it bestows; it is calculated far beyond any other human means to give permanence to the scenes and characters it so exquisitely describes.

As a song writer, he has adapted the Scottish melodies to such appropriate words, that he seems more like one discovering by inspiration certain thoughts which had lain hid in the tune, than like a writer adapting his own thoughts to the music. Sometimes in his descriptive and epistolary poetry, his mirth is coarse, but he is never vulgar (that we recollect) in his songs; even in the rustic and bacchanalian strains. His love songs are the best. In comparing the different faculties of his mind as a poet, we think his feeling predominated considerably beyond his fancy. This may account for the simplicity of his amatory poetry, in the language of which, fancy is always a dangerous intruder. Setting aside the now forgotten authors of ancient ballads, he has done more for Scottish song, than all the other writers in our northern dialect. Crawford, Skinner, Ross, and Ferguson, are names not to be put in the most distant competition with his. Ramsay was, with all his other merits, an indifferent song writer. There are not above half a dozen songs true to the national character and dialect, produced within the last century, which have the exquisite stamp of merit sufficient to rank with his happiest effusions. Those few are indeed very beautiful exceptions. The reader will, perhaps, anticipate that we allude to the "Flowers of the Forest," and "Auld Robin Gray," as the most striking instances. In one species of song he had no predecessor; we mean his war songs of Bruce to his troops, and the song of Death. In these he has risen to a lyric energy to which the pastoral genius of our muse does not follow him.

Dr Currie has scarcely left anything to do in illustrating the merits of his chief poems individually; and we own no small degree of gratitude to the memory of that good and great man, for so fully executing the trust of a critic and biographer to the poet of Scotland. Holy Willie's Prayer, which Dr Currie has omitted, is inferior to nothing which Burns has
written in force of humour; and his *Cantata of the Beggars*, which Dr Currie has likewise omitted, is another inimitable picture from low life.

We trust, as Scotchmen, we shall be pardoned for discussing at such length, the merits of a poet so peculiar in genius and circumstances. It is not that we undervalue the living or the future generation, when we say, that "we shall not look upon his like again." Our ancient language is expiring, and with Burns, or with MacNiel at least, it is probable, that Scottish poetry will also expire; we dwell therefore with fondness on the last voice of our Doric muse. We may find again the same genius spring from a cottage, and sufficiently acquainted with veritable life, to interest us in whatever belongs to simplicity and rustic nature; but we shall not again hear a poet, in that dialect which is at once venerable from ancient associations, and endearing, because it has been the real language of our childhood, and entwined with our earliest recollections. The affectation of obsoleteness will not be a substitute for this natural antiquity. Let them plant the moss of language ever so thickly, poets will only make out of this phraseology an artificial pile of ruins. But Burns's song is, to a Scotchman in a foreign land, the *rana de naranas* of his country. On the banks of the Ganges, or the Ohio, it recalls to him scenes of his playfellow, the images of his brothers and his sisters; it speaks to him also of Bruce and of Wallace in the very language which the heroes themselves spoke.

"He was alive (says Dr Currie,) to every species of emotion. He is one of the few poets, who have at once excelled in humour, in tenderness, and in sublimity; a praise unknown to the ancients, and which, in modern times, is only due to Ciceriost, to Shakespeare, and perhaps to Voltaire. To compare the writings of the Scottish peasant with the works of these giants in literature, might appear presumptuous, yet it may be asserted, that he has displayed the foot of Hercules." (a)

**BURNTISLAND, or BRUNITISLAND, a royal**

**burgh of Scotland, in the county of Fife, stands**

**upon a kind of peninsula at the bottom of the**

**Bann, a steep hill, on the north bank of the**

**Firth of Forth, nearly opposite to Leith. From its**

**insular situation, this town is airy and healthy,**

**not subject to epidemic diseases, and there are dry**

**and pleasant walks at all times in its vicinity. The**

**town is indifferently built, consisting chiefly of**

**one spacious street; and the church is an old square**

**building with a spire in the centre. Its harbour,**

**however, is one of the best on the coast. The**

**bottom is of a fine clay, and vessels ground very**

**easily; and, during spring tides, the water at the**

**heads of the pier is 22 feet deep. It is capacious,**

**secure, and of considerable depth at high water,**

**and being surrounded with hills in the form of an**

**amphitheatre, is completely sheltered from every**

**wind but the south. On each side of its entrance is a**

**projecting ledge of rocks, called the east and west**

**dish, which runs out to the sea for about 130 yards,**

**and breaks the heavy swells from the south west;**

**and the headlands of Clayness and Sand-end defend**

**it from the sea which are brought up the Firth by**

**easterly winds. There is excellent anchorage ground**

**in the outer roadstead, where the largest vessels ride in**

**safety. But notwithstanding the local advantages of this**

**harbour, though nature has done much, and a good**

**deal has been done by art, it is still capable of very**

**considerable improvements. It is always dry at low**

**water, and the spring tides ebb and flow with 20 to**

**30 yards without the piers. To render it commodious,**

**therefore, for passage boats and other small craft to**

**enter and sail at all times of tide, requires only an**

**extension of the piers, which, according to Mr Rennie,**

**might be easily accomplished, as plenty of materials**

**are to be found in the neighbourhood. "For this purpose,"**

**says that gentleman in his report to the trustees," the**

**two ledges of rocks, namely the east and west buoy,**

**afford an excellent opportunity; but owing to their**

**being upwards of 400 feet in length, the expense will**

**be considerable. The distance between these ledges,**

**at their extremity, is about 200 feet; and the soundings**

**between them, at low water spring tides, is from seven**

**to eight feet; and the decrease of depth from thence to**

**the present pier is gradual." Such an improvement**

**would not only be of essential importance to the town**

**itself; but were a correspondent pier to be erected at**

**Newhaven, as was proposed, it would be of the utmost**

**advantage to the county of Fife and the public in general,**

**as it would render a direct communication between**

**the two sides of the Firth at all times practicable.

**This town, before the union of the two kingdoms,**

**carried on a considerable trade to England in the**

**exportation of corn and malt; but since that time little**

**business of any kind has been done. Within these**

**fifteen years, however, trade has begun to revive;**

**and a considerable quantity of herrings have been**

**and a distillery, and the business of ship-building is**

**prosecuted to a considerable extent.

An excellent dry dock has lately been constructed by Mr Farnie, an inhabitant of Burntisland. It is very extensive and commodious, being 215 feet in length, and of a proportional breadth. The gates are 43 feet 4 inches wide, and contain 174 feet of water, which renders it capable of receiving the largest frigates.

Burntisland was strongly fortified by our French allies in the troubles of 1560; and from its natural strength, and its vicinity to the capital, it was then considered as a post of great importance. During the usurpation it stood out against Oliver Cromwell, until he agreed to repair the streets and harbour, and to build a quay; and in 1715 it was surprised and taken by the rebels. The remains of its walls and intrenchments are still visible; and on the south east side of the port are the ruins of an old castle, which was built by the Duriees, and which commanded both the town and harbour.

The peninsula on which the town is situated, and also much of the surrounding elevated country, is composed of rocks belonging to one of the newer coal formations. These rocks are greenstone, sandstone, limestone, bituminous shale, slate clay, clay ironstone, coal; and we suspect that the trap tuff, amygdaloid, and basalt, which occur on the Bin.
Dunean hill, Orrock hill, Alexander’s craig, &c. are members of the same series or formation. The beds of greenstone are frequently traversed by veins, which are filled with beautiful varieties of common chalcedony, flint, quartz, amethyst, calcareous spar, and brown spar. Agates occur imbedded in the greenstone, also in the amygdaloid; and we have observed serpentine and asbest in the greenstone, a fact which shows that serpentine is not confined to the primitive and transition mountains.

The government of this borough is vested in a council, consisting of 14 guild counsellors, and seven trade counsellors. From the former are chosen a provost and three bailies; but sometimes the provost is elected, from the neighbouring nobility and gentry, in which case he is a supernumerary. According to the census taken in 1811, Burntisland contains 192 inhabited houses, and 392 families, in which are 738 males and 877 females, making in all 1615 inhabitants. N. Lat. 56° 8’. W. Long. 3° 5’. (p)

BURTON-UPON-TRENT, a borough and market-town in Staffordshire, is situated on the west bank of the river Trent, over which it has an old stone bridge of 37 arches. Though an ancient town, it contains several handsome modern buildings; and its church, which was rebuilt in 1722, is much admired for its neatness and convenience. It has a neat town-hall, erected, in 1772, at the sole expense of the Earl of Uxbridge; and at the south-end of the town are the ruins of a Benedictine abbey, which was founded in 1004. It has also a free-school, and two almshouses. The principal manufactures of Burton are hats, of which large quantities are furnished for the army and navy, ironmongery, cotton, and light woollen stuffs. But it is chiefly famous for its ale, which is not only in high repute throughout England, but is exported to many parts of the continent. Burton is very conveniently situated for commerce, as the Trent is navigable for boats of considerable burden as high as the town; and it has also communication, by means of canals, with the principal cities of the kingdom. It has four annual fairs, one of which continues for five days, and a weekly market on Thursday. Number of houses, 738. Population, 3679, of whom 1925 are employed in trade and manufactures. N. Lat. 52° 50’. W. Long. 1° 36’. (l)

BURY, a borough and market town in Lancashire, is pleasantly situated on the east side of the river Irwell, about nine miles from Manchester, and 19½ from London. It is a large and prosperous town, and principally noted for its manufacture of cotton in all its branches, and for coarse woollen goods, called half-thicks and kerseys. Numerous factories are established on the rivers and brooks in the vicinity; and the conveyance, both of the raw material, and of manufactured goods, is greatly facilitated by the canal from Bury to Manchester. This town owes its wealth and commercial importance, in a great measure, to the laudable exertions of Sir Robert Peele, Bart., who has established extensive manufacturing and calico printing works on the banks of the Irwell, and who has given every encouragement to the invention and improvement of useful machinery. The church of Bury, which was rebuilt in 1780, is rather a handsome structure; besides which, it has a chapel of ease, and Methodist, Presbyterian, and Independent meeting-houses. It has also a free school for boys with two masters, and a charity school for boys and girls. A dreadful accident occurred here in 1787, by the falling of the theatre, when nearly 300 persons were buried in the ruins, many of whom were killed, and others terribly bruised. The population of Bury, by the increase of manufactures in its neighbourhood, was more than tripled in less than 30 years. In 1773, it contained 461 houses, and 2090 inhabitants; while, according to the census of 1811, there were 1341 houses, and 7072 inhabitants, of which 4545 were returned as employed in trade and manufactures. It has three annual fairs, and a weekly market on Thursday. N. Lat. 53° 56’. W. Long. 2° 26’. See Beauties of England and Wales, vol. ix. p. 291. (l)

BURY ST EDMUNDS, a populous borough in the county of Suffolk, is situated on the river Lark, and is remarkable for the salubrity of its climate, which has gained it the distinguished appellation of the Montpellier of England. It owes its name to an abbey, which was founded here, about the year 903, in honour of St Edmund, king of the East Angles, who was murdered by the Danes in a wood at Howze, and whose shrine, in the days of superstition, became a place of great resort and veneration. Of this abbey, which was esteemed one of the largest and richest in the kingdom, one gate only remains, which, however, presents a fine specimen of its former grandeur. It is a clean and handsome town, containing 800 streets, which are wide and well paved, and intersect each other at nearly right angles; and, including the suburbs, it extends a mile from east to west, and about two miles from north to south. Its principal buildings are, the churches of St Mary and St James’s, which are handsome structures, with spacious and elegant windows, and are deservedly esteemed for their exact and beautiful symmetry. The church of St Margaret is now converted into a shire-hall, where the county assizes are held. It has also a spacious guildhall, a beautiful market-cross surrounded with iron railing, an elegant little theatre, a free grammar school, four meeting-houses, and an hospital, or work house, for 30 boys, and as many girls. Its only manufacture is spinning wool, which is used in the fabrication of fine stuffs. The government of the town is vested in a recorder, 12 burgesses, and 24 common council men. One of the burgesses is annually chosen alderman, who holds the office of chief magistrate, and six senior burgesses act as assistant justices.

Bury St Edmund’s is said to have been the place where the barons of England, at the instigation of Cardinal Langton, entered into a confederacy to as-
BUSCHING, ANTHONY FREDERICK, was born at Stradhagen, in Germany, in 1724. After having been instructed in the Greek, Chaldaic, and Syriac languages, and also in mathematics and astronomy, by M. Hauber, the pastor of a German congregation at Copenhagen, he went, in 1742, to study divinity at Halle. In 1746, he published his first work, entitled, An Introduction to the Epistle of Paul to the Philosophians, which was followed by his exegetical lectures on Isaiah and on the New Testament. Having been employed, in 1748, to superintend the education of the eldest son of the Count Lnar, he accompanied that nobleman to St. Petersburg in 1749, and in the course of this journey he planned the new system of geography, which he afterwards executed with so much ability. The difficulties with which he had to struggle in the composition of this work, induced him to leave his present situation (1752), and to repair to Copenhagen for the purpose of completing it. In this city he conducted a monthly work on the state of the Arts and Sciences in Denmark; and when he returned to Halle, in 1754, he published his Vindiciae Septentrionis, and announced his design of publishing a work on the constitution of the principal states of Europe. This plan, however, was frustrated, by his accepting, in 1759, of the office of extraordinary professor of philosophy at Gottingen, with a salary of 200 rix-dollars to enable him to complete his geography.

In consequence of the death of Mosheim, Busching offered himself a candidate for the professorship of theology in Gottingen; but his religious opinions were not sufficiently sound, and instead of obtaining the object of his ambition, he was ordered by a rescript, issued in 1757, to abstain from lecturing on disputed points in theology, and from publishing any thing on that subject which had not been approved of by the privy council of Hanover.

In 1759, Busching was appointed public professor of philosophy, and his leisure hours were occupied in the completion of his geographical work. In 1761, he accepted of the office of pastor to a Lutheran congregation at St. Petersburg, where he founded a public school, which had risen to such reputation in 1763, that Catherine II. granted it several privileges. Some disputes, however, respecting this institution, produced a difference between him and his congregation, and occasioned his return to his native country. Busching now chose Altona as the place of his residence; and he continued here, notwithstanding the numerous proposals that were made to induce him to return to Gottingen. In 1765, he was appointed director of a gymnasium at Berlin; and in this capital he spent the remainder of his life, respected by all who knew him, and distinguished by his unenvied industry in literary pursuits. A pulmonary disorder, with which he was for several years afflicted, terminated his useful life, in 1793; and, according to his own directions, he was buried in his garden at midnight, without any ceremony.

The productions of this laborious writer were more than an hundred. His Geography, which was published at different times after the year 1754, was completed in six quarto volumes, and went through no fewer than eight editions during his life. He published also a Magazine for Modern History and Geography, which was completed in 22 quarto parts, between 1766 and 1788. His Weekly account of Maps appeared in detached parts, between the years 1778 and 1787.

BUSHEL, a measure of capacity for dry commodities. The standard bushel of this country, when measured in the presence of the House of Commons in 1696, was found to contain 2145.6 cubic inches of water; and this water, when weighed, amounted to 1131 ounces and 15 pennyweights Troy. In 1697, it was determined by act of parliament, that every round bushel, with a plain and even bottom, that was 18 inches diameter and 8 inches deep, should be regarded as a legal Winchester bushel, which will consequently contain 2150.42 cubic inches.

The bushel, in different parts of England, is of various sizes.

BUSHIRE, or more properly ABUSCHAH, the principal sea-port of Persia, in the province of Far-sistan, is situated on the extremity of a peninsula in the Persian Gulf. The town is of a triangular form, surrounded on two sides by the sea, and fortified towards the land by a wall, with twelve bastions, perforated at the top with holes, through which the defenders may point their musketry. The streets are only from six to eight feet wide, and the houses are mean and low, constructed chiefly of mud, or of a soft sandstone, which is obtained from the ruins of Reshire, in the neighbourhood. Those of the principal inhabitants are distinguished by a square turret, of which there are nine in Bushire; and this circumstance gives the city, at a distance, very much the
appearance of a burying-ground. Its only public buildings are the mosques, which are extremely mean, and of which there are four of the Shiites, and three of the Sunnites. It has also two hnnmums, and two caravansers. The house of the English resident stands about two miles from the town, and is the only place deserving the name of a building.

Bushire possesses a very commodious harbour, by which vessels can approach close to the city. Fleets of boats from the neighbouring coast bring coarse linen for turbans, earthen pots, mats, &c., which they exchange for dates. From Bombay, Masulipatam, and Bengal, it draws Guzerat kincobs, chintz, long cloths, muslins, &c. for which the return is generally made in species; but many of its broad cloths are imported from France by way of Russia; and notwithstanding the expense of land carriage, it buys them cheaper than they can be procured from the East India Company. The favourite colours are scarlet and yellow. Its principal exports are carpets, pearls, and cotton; and its inhabitants manufacture from the cotton bushes in the vicinity of the town, a kind of cloth nearly equal to the China nankine. It carries on also a considerable trade with Shiraz, by means of caravans.

Bushire owes its origin to the Arabs, who, at an early period, had formed settlements along the eastern coast of the Persian Gulf; and, till within these few years, it continued to be an independent state, governed by its own Sheik. The power of Sheik Nasr, the most celebrated of its princes, extended over the whole country, called Dasthistan; besides which, he possessed the isle of Bahrain, and a considerable territory in Kermess. This prince, though perpetually engaged in war, carried on a very extensive commerce with India and Muscat, which brought him considerable wealth. By this he was enabled to maintain a large standing force, which often withstood the whole power of the Persian monarchs: and, on an emergency, he could collect a numerous army of Arabs from the surrounding tribes; who, upon a well-known signal, willingly flocked to the standard of the hospitable chief. "The Sheik of Bushire," says Mr. Morier, "is still remembered, in his general conduct, with reverence. Whenever his little domain was threatened by the government of Persia, or by a neighbouring chief, Sheik Nasr flew to arms. According to the traditional accounts of the country, his summons to his followers in these emergencies was equally characteristic and effectual. He mounted two large braziers of Piltau on a camel, and sent it to parade round the country. The rough pace of the animal put the ladiges in motion, so that they struck the sides of the vessels at marked intervals, and produced a most sonorous clang. As it traversed the Dasthistan, it collected the mob of every district; every one had tasted the Arab hospitality of the Sheik, and every one remembered the appeal, and crowded round the ancient standard of their chief, till his camel returned to him surrounded by a force sufficient to repel the threatened encroachments." His descendants, however, were unable to maintain the government which he had strengthened and so long upheld. His grandson, Abdullah Rezau, a young man of indolent and dissolve habits, inherited none of those qualities, which commanded

the affections and services of his people, but merely filled the office to which he had been born, and held his precarious authority only at the will of Persia. Being unwilling or unable to comply with the demand of the governor of Farsistand for a sum of money, he was deposed in 1808, when Mahomed Nebee Khan, formerly a poor merchant, and afterwards Persian ambassador at Calcutta, procured the succession to the government of Bushire, for 40,000 tomauns, equal nearly to as many pounds sterling.

The town of Bushire contains about 400 houses, with nearly an equal number of date-tree huts; and its population is estimated at 10,000. N. Lat. 29° 59'; E. Long. 50° 43'. See Morier's Journey through Persia, Armenia, and Asia Minor, to Constantinople, in the Years 1808 and 1809, p. 56; Waring's Tour to Sheeraz, p. 2, &c. in Phillips's Collection of Voyagers, &c. vol. vi.; and Niebuhr's Travels, vol. ii. p. 117.

(p.)" Bustard Bay, on the coast of New Holland, was discovered by Captain Cook in 1770, and received its name from a species of bustard which he found there, which was as large as a turkey, and the best bird he had eaten since his departure from England. The country about this place is of a dry and sandy soil, and is much worse than at Botany Bay. The hills, however, are covered with trees, which grow separately without underwood; and on the sides of the bay grows the true mangrove, such as is found in the West Indies. "In the branches of these mangroves," says Captain Cook, "there were many nests of a remarkable kind of ant, that was as green as grass; when the branches were disturbed, they came out in great numbers, and punished the offender by a much sharper bite than ever I had felt from the same kind of animal before. Upon these mangroves, also, we saw small green caterpillars in great numbers; their bodies were thick set with hairs, and they were ranged upon the leaves, side by side, like a file of soldiers, to the number of twenty or thirty together. When we touched them, we found that the hair on their bodies had the quality of a nettle, and gave us a much more acute, though less durable pain." The shoals and sand-banks abound with pelicans, and the sea with fish and oysters of various kinds, both hammer and pearl. Captain Cook supposed, that the inhabitants had neither clothes nor habitations; but that they spent the night among the other commoners of nature in the open air. W. Long. 206° 18', S. Lat. 24° 4'. (p.)

Butcher; a word of uncertain derivation, signifies a person who slaughters cattle for the table, or for sale. In London there are two sorts of butchers: carcass butchers, who kill meat in large quantities, and sell it out to others, called retail butchers, who are dispersed in all out-parts, villages, and towns, near the city.

The company of butchers, although ancient, formed no corporation until the third year of James I., when they were incorporated by the name of masters, wardens, and commonalty of the art and mystery of butchers. Their arms are azure, two axes saltierwise argent, between three boars' heads couped, attired, or, a boar's head gules, between two garbes vert.

Several useful laws have been made, at different
times, for the purpose of regulating the trade of butchers, and preventing those abuses which they might otherwise be liable to commit.

By the statute 15th Car. II. c. 8, no person exercising the trade of a butcher, shall sell, offer, or expose for sale, any live cattle, on pain of forfeiting double value. By 2d and 3d Edw. VI. c. 15. revived and continued by 22d and 23d Car. II. c. 19. now excepted, if any butchers shall conspire not to sell their victuals, but at certain prices, they are liable, for the first offence, to a forfeiture of £10 to the king, or twenty days imprisonment, with bread and water only; for the second offence, £20, or the pillory; and for the third offence, £40, or pillory, with the loss of an ear and infamy. And this offence may be determined by the sessions or leet. By the ordinance for bakers, &c. butchers selling swine's flesh meased, or flesh dead of the murrain, shall, for the first time, be grievously amerced; the second time suffer the pillory; the third time be imprisoned and fined; and the fourth time forswear the town. (Hawk. Stat. vol. i. p. 181.) By statute 4th Hen. VII. c. 3. no butcher shall slay any beast within any walled town, Carlisle and Berwick excepted, under a penalty of £2d. for every ox, and 8d. for every cow or other beast. Butchers shall not kill or sell any meat on Sundays, under a penalty of 6s. 8d. by 3d Car. I. c. 1.

By the statutes 1st Jac. I. c. 22., and 9th Ann. c. 11. regulations are made with regard to the watering, wilfully or negligently gashing of hides, or selling them when gashed, and also to the selling of putrenied or rotten hides; to each of which offences different penalties are annexed. By the former statute also, no butcher shall be a tanner or currier, on pain of 6s. 8d. a day. See Jacob's Law Dict.; and Burn's Justice of the Peace. (2)

BUTE, an island on the western coast of Scotland, lies in the mouth of the Frith of Clyde, and is separated from the district of Cowal, in Argyllshire, only by a long and narrow channel, about half a mile broad. The origin of its name has never been rightly ascertained; though some ancient authors derive it from Buthe, which, in the Irish language, signifies a cell; and they say that St. Brendan, an Irish abbot, erected a cell here in the 6th century. It has indeed been variously written, as Buthe, Bouth, and Boute, and we find it denominated Buta by the anonymous geographer of Ravenna. The extent of Bute from north to south is fifteen miles, while its medium breadth is little more than three; and it contains between 23,000 and 24,000 Scotch acres. This island has rather a flat appearance, although there is a gradual ascent from the east and west shore, but no where does the ground rise more than 400 feet above the level of the sea. The coast is rocky, and indented with several deep bays, which renders its line of circumference very irregular. Bute enjoys the most genial climate on the west of Scotland; the intense cold of the mainland in winter, and the oppressive heats of summer, being moderated by its proximity to the ocean; and it has been recommended to persons labouring under complaints requiring a mild climate, as equal in most points to Devonshire, and in some even surpassing it. Snow never falls to any great depth, and seldom remains four days upon the ground. Mists and fogs are unknown in this island, though it is sometimes exposed to heavy storms of wind and rain. Yet even these are not so frequent or severe as in some of the neighbouring districts. The high mountains of Arran, by attracting the clouds, which are carried by the south-west wind along the Arryshire mountains towards Glasgow and Greenock, where they discharge their contents, leave Bute comparatively free. It has been remarked, that the months of March and April are here peculiarly dry; and some have even questioned whether more rain falls in this island than upon the eastern coast of Scotland.

The soil of Bute is in general light and sandy; but, if properly managed, well suited for every kind of husbandry. Plenty of limestone is to be found in various quarters of the island; the beds of sea-shells are apparently inexhaustible; and vast quantities of sea-weed are constantly thrown upon its shores. Agriculture, however, is here still in its infancy, and is conducted much in the same way as it was half a century ago, without any deviation or attempt at improvement. The capital of the farmers, instead of being laid out in improving their land, has been chiefly employed in the herring fishery, which was here carried on to a considerable extent, and which was preferred to agriculture, as it afforded them a more speedy and lucrative profit. Cultivation has thus been almost completely neglected. The lands have been allowed to run waste for want of clearing, and have been impoverished by an almost constant rotation of cropping, with little or no manure. A course of unsuccessful years, however, have reduced the number of vessels employed in the herring fishery to less than one third, by which the difficulty of procuring labourers for the purposes of husbandry have been considerably lessened; and a spirit of emulation in agricultural improvements has been lately excited among the tenantry, by the liberal encouragement given by the Marquis of Bute for draining and enclosing the different farms upon his property. By such exertions, it is to be hoped, that this spot, so highly favoured by nature, will soon be rendered equal to the richest and most flourishing districts of the kingdom. Most of the island is now well enclosed, and subdivided with ditches and hedges of white thorns, which are tall, thick, and vigorous. They afford shelter and warmth to the land, and make a very agreeable appearance. The roads of this island are ill-conducted, narrow, and in wretched order; and the barbarous customs of thievery, kane fowls, and other services, still exist here, but which ought to be universally exploded as the last remains of feudal oppression.

The chief produce of the island consists of barley, oats, and potatoes; also turnips, and artificial grasses, which flourish here uncommonly well. They have a ready market at Greenock and Glasgow for cattle and grain of every kind; and packets are continually passing between these places and Rothesay. Excellent bunks for white fishing are to be found all round the island, which are completely neglected for the sake of the herrings; and though there are also abundance of lobsters, crabs, and oysters, yet it is seldom they are to be procured. Bute is well stocked with hares, partridges, snipes, green and grey plovers. It has likewise plenty of ducks, teal, and other sea-fowl.
common to the western coast of Scotland; and in some winters a great abundance of woodcocks.

The property of this island belongs entirely to the Marquis of Bute, with the exception of the estate of Kaims, and three or four small properties worth from £150 to £200 a-year each. Mount Stuart, his lordship's country-seat, is an elegant mansion surrounded with a forest of fine trees, and commanding a beautiful view of the Frith of Clyde, and the shipping which enters that river. The Marquis is admiral of the county, by commission from his Majesty; and his power is entirely independent of the lord high admiral of Scotland.

At Langal-chordin are the remains of a Druidical circle; and at Kingarth, the ruins of a church, of which two cemeteries only remain, and near it is a circular enclosure called the Devil's cauldron. This building covers an area of thirty feet in diameter, and the walls, which are about ten feet in thickness, and seven feet high, are formed of stones piled together without mortar, but trimmed in the inside in a smooth and regular manner.

Considerable hopes were once entertained, that a seam of coal might be found in this island, and several attempts were made for that purpose, but unfortunately without success. This want of proper fuel is one of the greatest inconveniences under which the inhabitants presently labour, as all their coals must be brought from Glasgow, and at a great expense.

The whole of the north part of this island is composed of primitive and transition rocks, which, in some places, as at Kaims Castle, the seat of Lord Bannantyne, rise into hills of considerable height. The rocks are mica slate, clay slate, and chlorite slate. These strata are traversed by numerous veins of quartz, and also of trap, which are from a few inches to several feet in breadth. Near to Kaims Castle there are several slate quarries; but the slate is inferior to that of Eisdale. The north side of Rothsay bay is composed of slate; so also is the north side of Scalpa bay, which is situated upon the west side of the island, and nearly in a line with Rothsay; but the south sides of these bays are composed of the first flætiz, or red sandstone. The country between Rothsay and Cel-Chattan bay, which is the lowest, most beautiful, and best cultivated part of the island, is composed of red sandstone, belonging to the first flætiz formation, which is traversed by many veins of trap. From Cel-Chattan bay to the southern extremity of the island, called Gurroch-head, the country becomes nearly as high as in the north end, rising into irregular hills, with abrupt perpendicular crags, as is the case in all countries containing considerable portions of trap rocks. This part of the county is composed of sandstone, and various rocks of the trap formation, and these are traversed by numerous trap veins. We may add, that as thick beds of coal have been found in red sandstone in various countries, this useful mineral may also occur in Bute.

The population of this island in 1801, amounted to 6106. It is now between 7000 and 8000, of whom about 4000 inhabit the royal burgh of Rothsay. Most of the natives speak English very well, but when conversing with one another, they prefer the Gaelic, which is their mother tongue, and which chiefly prevails among the old people.

Bute gives name to a shire, which consists of the islands of Bute and Arran, together with the small isles of Greater and Lesser Cumbrae, and Inchmarnoch; and sends a member to parliament alternately with Caithness. The whole shire, according to a very recent and accurate measurement, contains 158,96 English square miles, or 98,547 English acres, or 78,131 Scotch acres. See Beauties of Scotland, vol. v. p. 536; Pennant’s Tour in Scotland, vol. ii.; Sinclair’s Statistical Account of Scotland, vol. i. p. 310; and The Farmer’s Magazine for 1811, p. 427. (p) BUTEA, a genus of plants of the class Diadelphus, and order Decandria. See BUTANY, p. 274.

BUTLER, Samuel, author of the most celebrated burlesque poem in our language, was the son of a farmer at Strenaisham in Worcestershire, where he was born, according to Dr Nash, in 1612. He received a grammar-school education at Worcester. Wood and other biographers have placed him for seven years at Cambridge; but it is remarkable, as Dr Johnson observes, that Wood, although he pretends to have had the account from his brother, could not tell his hall or college; and it is not likely that Butler should have so long inhabited a place of learning, with so little distinction as to leave his place of residence uncertain. The learning of Hudibras may be objected to Dr Johnson’s doubts of his academical education, yet it must be said, that the learning which shews itself in allusion may be collected from various reading; while that which illuminates dissertation, can perhaps be imbibed only in seminaries of rudiment. On his return to his own county, he was for some time clerk to Mr Jeffreys of Earl’s Croomb, an eminent justice of the peace. In his service he had leisure not only for study, but recreation. He addicted himself to music and painting. In the latter he was instructed by Cooper, whose friendship for him is recorded, to the mutual honour of the poet and painter. He lived afterwards in the family of the Countess of Kent, probably as assistant to the celebrated Selden, who was the steward of the Countess. Here he enjoyed the use of a good library, and the still greater advantage of Selden’s acquaintance. This circumstance may explain his learning, without having recourse to a college. His next residence was with Sir Samuel Luke, at Cople in Bedfordshire, an officer of Cromwell, and a leader of the Puritans, whose character furnished him with the original of Hudibras. At the Restoration, Butler is described as an expectant for the reward of loyal principles; he was, however, only made secretary to the Earl of Carbury, president of the principality of Wales, who conferred on him the stewardship of Ludlow Castle, when the court of the marches was revived. In this part of his life he married Mrs Herbert, a gentlewoman of fortune; but her fortune was lost by bad securities. In 1663 was published the first part of his Hudibras, which, being recommended by the taste of the Earl of Dorset, was quoted by the king, and studied by the courtiers. In 1664, the second part appeared. Yet with all his literary merits and party claims, praise was his only reward. He was introduced, we are told by Packe, to the Duke of Bucking-
Butler, Samuel

Butler, Joseph

ham; but his Grace had no sooner set himself down beside the poet and his friend Wycherley, who introduced him, than observing a couple of ladies pass by an open door, he quitted his engagement to follow another kind of business. This anecdote seems to be corroborated by some verses against Buckingham, written with extreme acrimony, and which have been published by Mr Thyer in the genuine remains of Butler. Notwithstanding this discouragement and neglect, he still prosecuted his design; and in 1678 published a third part of Hudibras, which still leaves the poem imperfect and abrupt. He died in 1680, and Mr. Longueville, who had supported the poet in his indigence, and who received from him his manuscripts before his death, having in vain solicited a subscription for his interment in Westminster Abbey, buried him at his own cost in the church-yard of Covent-garden. Sixty years after his death, Barber a printer, erected a monument to him in Westminster Abbey, which, by a strong allusion to his poverty, has probably created a common tradition that he died of absolute want.

It will not be necessary to inform many readers, that the object of the poem of Hudibras was to expose the fanaticism of the Puritans, in the same manner as Cervantes exposed the passion for knight-errantry. Hudibras is the Don Quixote, and Ralphi is the Sancho of Butler. Both satirists exposed the folly of their respective objects of ridicule when they had fallen into decline; but it must be owned, that the Spanish satirist is as superior in generosity to his fallen foe, as he is in originality; Cervantes makes us love Quixote while we laugh at him; Butler clothes him in deformity and contempt. The Spanish mock hero is much more natural and probable; he springs out of circumstances easily and instantly conceivable;—the Puritan mock hero arises from an odd complication of the times; he is the creature of politics, of peculiar and local manners, and superstition; a compound of pedantry, fanaticism, and knight-errantry. We can imagine at once a Don Quixote, because he is a simple though mock knight-errant, translated as he is from a foreign language; but we cannot imagine a real Hudibras, though we read of him in English. The reason seems principally to be, that we have united in Hudibras the incongruous characters of Puritan and knight-errant. What was chiefly ridiculous in the former of these characters was false humility, in the latter false elevation. It is impossible to satirize both under the same hero. Butler makes his hero low at the outset, and it is impossible to debase him by incident; he fails, therefore, in effecting any contrast of character between his knight and the squire, his obstinate independent clerk;—unlike the happy model of Cervantes, where our chief entertainment arises from the contrast of the noble master and the cunning servant. Independent of this infelicity, the story of Hudibras is meagre and uninteresting; it wants unity; and though we cannot pronounce what the story would have been if it had been prolonged, it is easy to perceive, that out of such a design no captivating fable could ever have been formed. The dialogue of Cervantes is for ever amusing: that of Butler is fatiguing, not from insipidity, but from straining the mind to attend to subtle, remote, learned, or metaphysical combinations.

Yet while we may safely pronounce the poem of Hudibras to be inferior to no human production in point of wit, we must forget our own sensations in reading it, or we must pervert the meaning of the word humour, if we deny it that quality. Whatever may be said of the other characters, that of the lawyer, at least, is supported with exhilarating humour. The principal merit of the poem is its close sententious wit;—its profoundly wise, and true, and surprising, though laughable adages;—its successful travesty of every metaphor and simile in the stock-house of poetry;—its converting rhyme itself from an ornament to an instrument of burlesque in verification; and the talent which it displays of sending at once the powers of fancy and erudition in quest of ludicrous associations. Hudibras is a mine of mottos. He had watched (as Dr Johnson observed) with great diligence the operations of human nature, and traced the effects of opinion, humour, interest, and passion. From such remarks proceeded that great number of sententious distichs which have passed into conversation, and are added as proverbial axioms to the general stock of practical knowledge. (x)

Butler, Joseph, a prelate of the greatest distinction in the church of England, was a native of Wantage in Berkshire. His life, like that of most literary characters, affords but few events remarkable either for their singularity or their variety. But on this, as on many other occasions, we have to lament the conduct of surviving friends, who, with a view to conceal all the more human features of a great man’s character, deprive us of all access to his familiar society, and exhibit him only at a distance in the cold and dignified attitude of a statue. Whether we consider the high elevation, from a low origin, to which he attained in life, the rank, dignity, and learning of his friends, or the mighty and almost unparalleled grasp of his own intellectual powers, Bishop Butler was surely a man, whose opinions, sayings, and private habits of life, not excepting even his juvenile history, could bear as minute a recital, as those of any literary character of his or any other time. He was born in 1692, of respectable parents, of the Presbyterian denomination; who perceiving, at an early period, the predilection of their son for a life of study, did not fail to encourage, to the utmost of their power, so flattering a disposition. By his respectable industry as a shopkeeper, his father, Mr Thomas Butler, was fortunately enabled to afford Joseph, who was the youngest of eight children, a course of preparatory education at the grammar school of Wantage, under the Rev. Philip Barton; whence, with the view of qualifying him for the ministry, he naturally sent his son to an academy of his own persuasion. This Presbyterian seminary, which had the honour of giving Butler and some other great men to the world, was superintended by Mr Jones, first at Gloucester and afterwards at Tewkesbury.

Here our young student soon rendered himself...
conspicuous; by his intense application to his professional studies, and particularly to the department of metaphysics. Of this early distinction, a memorable proof will always remain. Dr Clarke's celebrated demonstration of the being and attributes of God, was at this time in the hands of the learned, and of course commanded the deep attention of the kindred mind of young Butler. Though scarcely 20 years of age, and still immersed in the multifarious routine of academical pursuits, he contrived to make himself master of that most abstruse demonstration; studying, however, not so much the book as the subject, rigidly examining the validity and consistency of the arguments, and even rejecting some as either obscure or inconclusive. These juvenile doubts he respectfully transmitted to Dr Clarke in an anonymous letter, dated the 4th November 1713. His candour, sagacity, and depth of thought, did not fail to excite the particular notice of the Doctor, who, no doubt, conceived the letter to be the production of some experienced philosopher. Encouraged by this attention, he addressed the Doctor sever-

eral times upon the same subject, and was likewise honoured with his great antagonist's replies; and the whole correspondence being soon after annexed to the admirable treatise above mentioned, it has been retained in all the subsequent editions. The only person in Butler's secret, on this occasion, was his friend and fellow pupil Mr Secker, who conducted this philosophical affair with all due mystery, by carrying the letters in person to the post office at Gloucester, and bringing back Dr Clarke's answers.

It is natural to suppose, that the acquisition of such a promising mind would soon become an object of desire with the leaders of any church; and the particular friendship of Dr Clarke, with which, on the disclosure of his name, Butler was immediately honoured, could not fail to inspire his youthful mind with the desire of signalising his talents in a more extensive, and therefore a more useful field, than that afforded by a dissenting communion. Accordingly we find that about this time the subject of non-conformity engaged his particular attention; and the result of his deliberation was a determined resolution to attach himself to the church of England. Against this measure his father protested, with a warmth natural to a man concerned for the principles of his son, and interested in the honour of his party; and to strengthen his remonstrances, called in a meeting of the most eminent Presbyterian divines. All their united endeavours to dissuade him from his purpose were in vain: his resolution was fixed; and he was soon afterwards suffered to remove to Oxford, where he was admitted a commoner of Oriel college, on the 17th of March 1714.

It does not appear at what precise time Butler took orders, nor by what bishop he was ordained. One thing seems highly probable, that some deviation from the established rules was tacitly permitted in his case, in consideration of his previous acquisitions; for it is reported that very soon after his admission at Oxford, he entered into the church, and occasionally assisted Mr Edward Talbot in the divine service, at his living of Henred near Wan-tag.
BUTLER.

Butler, Joseph.

having been recommended by Mr Talbot, on his death-bed, to his father the bishop of Durham, he was presented to the benefice of Haughton in 1722; nearly four years before the publication of his sermons. This living and the Rolls he held together for three years, agreeably dividing his time between the town and the country; a mode of life peculiarly adapted to the temperament of a man who was at once dependent on the society of his friends, and yet attached to contemplation and retirement. In 1725, his steady friend Secker, who had acquired a very considerable influence with Bishop Talbot, prevailed on that prelate to remove Butler from Haughton, where extensive repairs of buildings had become necessary, for which the incumbent had neither money nor talents. He was accordingly presented to the rectory of Stanhope in the same diocese: a living of much superior value, and indeed one of the richest parsonages in England. Having quitted the Rolls in the following year, he resided wholly at Stanhope; where, for the space of seven years, he devoted himself to the conscientious discharge of all the duties of a parish priest.

This retirement, however favourable to Butler's contemplative turn of mind, and to the production of his Analogy, which we may suppose was now the main employment of his reside hours, was far too solitary for his disposition, which had in it a deep tincture of melancholy. He felt at times, most painfully, the want of that select society to which he had been accustomed in the metropolis, and which was so well calculated to afford a delightful relaxation after the fatigues of study, and of professional labour. This circumstance was not unknown to his friends, who were therefore extremely anxious to bring him back into the world. Mr Secker particularly exerted himself on this occasion. Having himself been appointed king's chaplain in 1732, he one day, in the course of a conversation with Queen Caroline, took occasion to mention his friend's name. Her majesty said she thought he had been dead; and asked Archbishop Blackburne if this was not the case. His reply was, "No, madam, but he is buried." This activity of Mr Secker in behalf of Butler, was at last rewarded with complete success; having found means, on the elevation of Mr Charles Talbot to be lord chancellor, to have him effectually recommended to his lordship for his chaplain. The chancellor accordingly, in 1733, nominated Butler, who accepted the nomination, and immediately set off for London. Taking Oxford in his way, he was there created Doctor of Laws. A prebend in the church of Rochester was also conferred upon him by the same patron; and that he might once more return to his favourite mode of life, it was agreed that he should still reside half the year at Stanhope.

In 1736 he was appointed clerk of the closet to the queen; to whom, in the same year, he presented a copy of his great and immortal work, "The Analogy of Religion, Natural and Revealed, to the constitution and course of Nature," together with two brief dissertations annexed to it; one on personal identity, and the other on the nature of virtue.

His philosophy of morals had been published by the author when young, in the form of sermons. His ripper judgment induced him to throw his theory of religion into the form of regular dissertation. The reasoning contained in the Analogy, is founded on a topic, which the author had treated in one of his sermons, the ignorance of man; a topic to which he was somewhat partial on all occasions. The general idea which runs through the work is as follows:—The difficulties which occur in religion, both natural and revealed, are precisely of the same complexion as those which occur in the economy of nature. But as, from our limited knowledge, the difficulties of nature are admitted to be no proof of its not having a divine author; so the difficulties in religion, having probably no other cause than our ignorance, not merely are no evidence against its truth; but afford rather a presumption, from the similarity in both cases, that both nature and religion are conducted by the same government, and on the same plan. Since, then, we perceive a striking resemblance between the systems of nature and of religion, and as to many remarkable events in the economy of grace there may be found corresponding facts in real life; it is logical to conclude, that this resemblance will be found to hold in parts beyond our view, and that to natural occurrences which take place at present, there will be corresponding occurrences in an after state.—Taking therefore this analogy as his guide, Butler follows it most beautifully through the constituent tenets of religion, and thus confirms the doctrines of a future existence, of probation, of retribution, of the moral government of God, and of the peculiar doctrines of revelation. It ought ever to be had in recollection, that, from its very nature, analogical reasoning is, by itself, incapable of establishing any point, except perhaps, the single one of theoretical possibility. Its chief effect is merely to confirm evidence derived from a different source; and while it pretends to no infallible deductions, contents itself with simple probability. There are two important objects which Dr Butler has accomplished by his Analogy, with respect to the Christian religion: he has at once disposed our minds more readily to admit its positive evidences, by shewing its conformity to the other departments of the divine government; and clearly demonstrated that it is not, primae facie, according to the absurd assertion of some Deists, a proper subject of ridicule, but a system that at least may be true.

During the short remainder of Queen Caroline's life, who died in 1737, she required the attendance of Dr Butler for two hours every day, from seven to nine in the evening. Her demise was no obstacle to his preferment; for so effectually had that excellent princess recommended him to his majesty's protection, that in the ensuing year he was promoted to the episcopal dignity, being consecrated to the see of Bristol on the 3d of December, 1738. In addition to this splendid mark of royal approbation, the king conferred upon him, in 1740, the deanery of St Paul's, London; upon which, from the great accumulation of duty, he immediately resigned the rich benefice of Stanhope. During this period he was called upon to preach several sermons on public occasions in the metropolis; which were printed, and have been since annexed to those preached at the Rolls. In 1746, upon the death of Dr Egerton, bishop of Hereford,
Dr. Butler was made clerk of the closet to the king; and on the 16th of October, 1750, he was translated to the princely see of Durham,—an appointment which we may easily conceive was peculiarly agreeable to the worthy prelate, from having been so long connected with that diocese in his younger days.

At his primary visitation, which was in 1751, he delivered the famous charge to his clergy, which was printed at Durham. Of this his first and indeed last charge, the principal object was "external religion." For, having long observed the growing indifference of the people, and particularly of the lower orders, to sacred matters, he, on this occasion, strenuously insisted on the usefulness of outward forms and institutions, and of calling in the aid of the senses to excite feelings of duty and devotion. The forms of religion he would have to occur as frequently as possible, so as ultimately to produce some general effect; and this he showed to have been the policy under all the other systems of religion. Under these, he observes, religion has had a conspicuous part in all public appearances, and the face of it has been kept up with great reverence throughout all ranks, from the highest to the lowest, not only upon occasional solemnities, but also in the daily course of behaviour. In the heathen world, their superstition was the chief subject of statuary, sculpture, painting, and poetry. It mixed itself with business, civil forms, diversions, domestic entertainments, and every part of common life. The Mahometans are obliged to short devotions five times between morning and evening. In Roman Catholic countries, people cannot pass a day without having religion recalled to their thoughts, by some or other memorial of it; by some ceremony or public religious form occurring in their way; besides their frequent holidays, the short prayers they are daily called to, and the occasional devotions enjoined by confessors. By these means, their superstition sinks deep into the minds of the people, and their religion also into the minds of such of them as are serious and well disposed. It is evident, from the general strain of the good bishop's charge, that he highly approved of this policy, and that he even regretted that partial diminution of pomp and splendour which the Reformation had introduced into the service of the English church. "Indeed," says he, "in most ages of the church, the care of reasonable men has been, as there has been for the most part occasion, to draw the people off from laying too great weight upon external things; upon formal acts of piety. But the state of matters is quite changed now with us. These things are neglected to a degree, which is, and cannot but be, attended with a decay of all that is good. It is highly seasonable now, to instruct the people in the importance of external religion."

We are fully aware of the reverence due to such a character as Bishop Butler; but we cannot help regretting, that he should seem to have recommended so emphatically those mechanical expedients for exciting devotion, which in all ages have degenerated into superstition. It is singular enough that, among all these outward means, he does not once allude to education. The bishop asks, whether it would be superstition, were men brought to be affected with devout feelings at the sight of a church? We conceive their feelings would be much more rationally excited, were the English poor more generally taught to read the Bible: and all the excellent methods of external religion recommended in the charge would certainly be multiplied in their effects, by the single addition of a competent education.

We can easily conceive, that the bishop would have gone much farther in reviving external pomp, did the constitution of his church admit of it. And this conclusion we are warranted to draw, not merely from the general strain of the charge, which some how or other has narrowly escaped being suppressed; but from another circumstance still more unequivocal: we allude to the marble cross which he erected in his chapel at Bristol, to enliven his own private devotions. This bold attempt at reviving ancient forms, calculated to impose on the senses, gave great and universal offence to the church; and, combined with the theory inculcated in the charge, gave rise to public discussions, which, though anonymous, were yet sufficiently important to command attention. In 1752, there appeared an able and spirited pamphlet, understood to be written by a clergyman of the church of England, entitled, A serious Enquiry into the Use and Importance of external Religion, addressed to the bishop. The writer, the only direct antagonist that Dr Butler ever met with, accused him, in a pretty sharp style, of speaking favourably of pagan and popish ceremonies, and countenancing, in some degree, the cause of superstition: he animadverted on his number, variety, and frequency of forms, as being too apt to be considered by the vulgar as commutations for their vices, and as something substituted in lieu of repentance; and insinuates, not obscurely, that his lordship was no enemy to the Roman Catholic form of worship. We have been the more particular in our account of the Charge, as we wished to lead the reader to the true foundation of the report which was afterwards raised, that Bishop Butler had actually died in the Roman Catholic communion. This was formally asserted, fifteen years after his death, in an anonymous pamphlet, entitled, The Root of Protestant Errors examined; which has been answered by Archbishop Secker, and others. But, in truth, there was not the least reason for such an aspersión. The plain statement has already been given. The bishop, in conformity to his theory, wished to introduce a more ceremonious form of worship, and probably would have had no aversion to pictures and statues, any more than to crosses in churches; but all this has evidently no more to do with the Roman Catholic faith, than it has with Presbyterianism. If he took delight in perusing the legends and miraculous lives of Roman Catholic saints, this was no more than has been often done by many other Protestants: besides, as Secker justly observes, Dr Butler was a man who knew how to draw instruction from any book.

By his promotion to the see of Durham, he was placed in a situation highly favourable to the exercise of that beneficence and liberality which constituted one of his greatest enjoyments. Blessed, too, with ample means of encouraging and promoting men of piety and fidelity, and thus promoting prac-
tically that religion of which he was one of the ablest
defenders, his prospect of doing much good was al-
most as extensive as his wishes. But this prospect
soon vanished. His health began visibly to decline
soon after his removal to his new bishopric. When
complimented on his great resignation during his in-
disposition, he is reported to have expressed his re-
gret, that he should be called away so soon from this
world, after he had become capable of doing more
good in it. During this his last illness he was car-
rried to Bristol, to make trial of the waters of that
place: but no benefit resulting from these, he re-
oved to Bath; where, being completely exhausted, he
calmly breathed his last, at the age of sixty, on the
16th of June 1752. His corpse was conveyed to
Bristol, and interred in the cathedral. A flat marble
stone, placed over the spot where his remains are de-
posited, contains a Latin epitaph, now nearly obli-
terated, said to have been written by his own chap-
lain, the learned Dr Nath. Forster.

Few characters are, upon the whole, more entitled
to our veneration than Bishop Butler. His works
will continue to bear testimony to his strength of
mind, and originality of view, as long as their sub-
jects shall interest the world; and he may be ranked
among the ablest defenders of revelation, since the
age of the apostles. The selection of his topics was
sometimes unavoidably influenced by the questions
of the day. Some of them are such as, perhaps,
would not now be discussed with much interest; but,
if they have ceased to agitate the philosophical world,
it is in a great measure owing to the rigid accuracy
with which they were finally elucidated by himself.
It has indeed been remarked, that his reasoning is
generally better calculated to silence than to con-
vince; and that, by dwelling so much on the uncer-
tainty and imperfections of the inferences of reason,
he is apt to produce a sceptical turn of mind. This,
however, was but the manner of the times. The in-
fidels of those days did not all pretend to reject re-
velation as a subject of rational enquiry. They at-
tacked particular points with all the subtility of me-
taphysical argumentation; and hence a necessity was
imposed on the friends of religion, to dispute every
inch of ground with corresponding minuteness.

Dr Butler's greatest praise is not that of an admi-
rable writer; he was equally distinguished as a man
and a Christian. His private benefactions were nu-
numerous, and his example in promoting charitable in-
stitutions eminently conspicuous. His piety was
truly sincere and fervent, leaning, perhaps, a little to
the gloomy and ascetic: a character which it possi-
ibly derived, in part, from his early education, and
partly from a natural disposition inclined to melan-
choly. His munificence was in all respects equal to
the great means with which Providence had blessed
him. Whilst bishop of Bristol, he expended, in re-
pairing and improving the episcopal palace, L. 4000;
being more than the whole emoluments of that see
amounted to during his incumbency. At Durham,
he supported the episcopal dignity with equal gran-
deur. He set apart three days in the week for do-
ing the honours of the bishopric, and entertained
the principal gentry of the county in the most princely
style. To his table were invited even the poorest of
his clergy; whom he occasionally visited at their pa-
ishes, and treated with the utmost kindness and
condescension. Bishop Butler was never married.
At his death, it is said that he ordered all his manus-
cripts to be burnt, without inspection. See Biog.
Brit.; and Halifax's Preface and Notes to the Ana-
logy. (2)

BUTOMUS, a genus of plants of the class Emen-
andrys, and order Hexagonia. See Botany, p. 207.
BUTTER, a fat unctuous substance, usually pre-
pared from the cream of cows milk by agitation.
It is of a yellow colour, sometimes higher, sometimes
lighter, possesses the properties of an oil, and readily
mixes with other oily bodies. The process by which
it is obtained from cream, is that sort of agitation
called churning, well known to every body.
When pure, it is soft and concrete, and of an agreeable
sweet taste. It melts at the temperature of 96⁰, and
becomes transparent; but if it be kept for some

Butter has been usually thought to be a matter
naturally distributed through the milk, and existing,
along with the caseous and serous parts thereof, in a
state of mechanical suspension, similar to that in
which oil is, when suspended in water by means of
syrup or mucilage. But though a mixture of this
sort, commonly called an emulsion, puts on a white
colour like milk, and its oily parts by rest rise to the
top, and form a cream similar to the cream of milk,
yet the experiments of Messrs Deyeux and Parmen-
tier seem to have proved, that butter does not ac-
tually exist in the cream, but that it is formed from
it during the process of churning, by certain chemi-
cal changes which then occur. These gentlemen
were led to form this opinion, by observing, that but-
ter could not be produced in any other way than by
agitation: because whatever substances or means
they employed to detach either the cheesy or but-
tery part of the cream, they always found agitation
or churning necessary.

Fourcroy considers the butyraseous matter of milk
as quite distinct from butter; and says, it is a white
liquid oil, suspended in the serum, by means of
the muco-saccharine and cheesy parts, which, combin-
ing with oxygen, forms butter. The oxygen he con-
ceives it to obtain partly from the atmosphere, and
partly from the milk itself. He is of opinion, that
butter in a small quantity can be obtained without
agitation; and says, that the oily particles of the bu-
tyraseous matter, which, from their greater levity,
float, when the milk is allowed to rest, on the sur-
fase of the caseous and serous fluid, absorb oxygen
from the atmosphere, and become real butter.

That important chemical changes take place dur-
ing the operation of churning, there can be no doubt;
but the nature of these is still, we apprehend, im-
perfectly understood. Farther experiments seem ne-
necessary to elucidate the subject. In all cases, there
is a considerable extrication of gas; and Dr Young
affirms, that there is likewise a rise of temperature
equal to four degrees. In the Mid-Lothian agricul-
tural report for 1795, it is stated, that cream chur-

BUTOMUS, a genus of plants of the class Emen-
andrys, and order Hexagonia. See Botany, p. 207.
BUT]
ed in contact with atmospheric air, absorbed a considerable quantity of it. But Dr Young has shown, that butter may be obtained from cream by churning, without the contact of air. These two statements, however, are not irreconcilable, since, according to Fourcroy, the butyraseous matter takes its oxygen partly from the air, and partly from the milk. That this matter should absorb oxygen, and thereby acquire the consistence of butter, is quite analogous to what happens to other oily bodies, which all become thicker by absorbing the oxygenous principle. The gas disengaged is probably the carbonic acid gas; for every person must have observed, that when even sour cream is churned, the butter obtained is perfectly sweet; and the milk remaining in the churn, called the butter-milk, is always much less sour than the cream had been.

Though butter is obtained usually by agitating cream, it may be also got by agitating milk as drawn from the cow, and even in greater quantity than from the cream alone of the same milk; a fact well known to those who superintend dairies. Even whey, by churning, yields butter. In the agricultural report before quoted, it is stated, that 27 Scotch pints of whey, that is, about 108 English, afford at an average one pound of butter. The oily part of the milk appears to have so strong an attraction for the other ingredients, that it never completely separates from them.

Butter can be obtained from cream, when sweet and newly taken from the milk; but it then requires, according to Fourcroy, four times as much churning as after it has become sour by standing: It appears, therefore, that by being kept, cream acquires new properties, in consequence of which, it can be with greater facility converted into butter. This can by no means be equally well obtained from the milk of every sort of animal. Indeed, the milk of some of them can never be made to yield any butter. No length of churning will produce it from the cream of woman's milk, or of mare's milk; while, on the contrary, the cream of goat's milk, and ewe's milk, yield it in abundance, and with as much facility as the cream of the milk of the cow, from which it is almost always made. The cream of asses milk, when long agitated, yields a soft, white, insipid butter, which has the singular property of again mixing very readily with the butter-milk, and of being capable to be again separated from it, by agitating the containing vessel under cold water.

When butter is kept for a certain time, it acquires a peculiar disagreeable smell and taste, known by the name of rancidity. This has been thought to arise from the developement of a peculiar acid, similar to, if not the same with, the sebacic acid. But Deyex and Parmentier have shewn, that no acid is present in rancid butter. Rancid oils, however, certainly do shew acid properties. The disposition of butter to become rancid, is owing in a good measure to the presence of foreign matters adhering to it; for if the butter be carefully washed, so as to separate completely the serous and curdy parts, rancidity does not take place nearly so soon.

When butter is distilled, we obtain a little water and sebacic acid: the greatest part of the butter comes over in the state of an oil, with a strong, pungent, and very disagreeable smell; much carbonated hydrogen gas is disengaged, and there remains in the retort a very small carbonaceous residuum, with a little phosphat of lime.

The most approved modes of preparing butter, the circumstances which influence its goodness, the uses to which it is put, and the best methods of preserving it, with its importance as an article of commerce, will be mentioned afterwards. Meanwhile, we observe, that this substance seems to have been very imperfectly, if at all, known to the ancients.

The word butter is no doubt from the Latin butyrum, and that from the Greek ρυγα, which is generally stated to be a compound of the two words ρυς, bos, and λυγ, congitud: while others contend that ρυγα is not of Greek origin, but derived from the language of the Scythians, from whom the Greeks first obtained the knowledge of butter. Certain it is, that Hippocrates is the first Greek author who mentions ρυγα. Speaking of the Scythians, he says, "they pour the milk of their mares into wooden vessels and shake it violently; this causes it to foam, and the fat part, which is light, rising to the surface, becomes what they call butter (ρυγα καλωσι).") Herodotus also, who was cotemporary with him from the year B. C. 459 to B. C. 413, particularly describes the process of making butter among the Scythians. This affords a presumption that the article was not then known among the Greeks, and that they acquired the knowledge of ρυγα, and the practice of making it, from the Scythians.

Some have imagined that they found butter mentioned in the writings of Moses, the book of Job, and other parts of the most ancient sacred scriptures. According to our translation, Abraham is said, Gen. xviii. 8. to have taken butter and milk, and the calf that had been dressed, to set before the august strangers who visited him. And in the well-known song, or historical ode of Moses, which he recited in the hearing of the Israelites, a short time before his death, (Deut. xxxii. 14.) we have the words "butter of kine." Butter is also mentioned in the song of Deborah and Barak, Judges v. 25. Certain friends (2 Sam. xvii. 29.) are said to have brought to Mahanaim, butter and other articles, for the refreshment of David and his army during the rebellion of his son Absalom. Honey and butter are also mentioned Job xx. 17; and in chap. xxix. 6. he says, "When I washed my steps with butter, and the rock poured me out rivers of oil." Butter and honey are also mentioned in the well-known passage in the 7th chapter of Isaiah, where the prophet foretels of the child, that he should eat butter and honey. And in the 30th chapter of the Proverbs it is said, "the churning of milk bringeth forth butter." But it is to be observed, that in all these passages, the Hebrew word is המב, hemde, which biblical critics agree in allowing to signify sour thick milk or cream. Besides, it is plain that hemde alludes to something fluid, for it was used to wash the feet. The error of supposing hemde to mean a concrete substance like butter, appears to have arisen from the Septuagint, who translate the Hebrew term by βουτρις, a word which, as they lived in Egypt two centuries after Hippo-
BUTTER.

Butter, they might no doubt have heard of, and supposed to correspond to the Hebrew word hema. That they meant, however, no more than cream by the term anomaly, is highly probable. No doubt, the common translation of the passage already quoted from the Proverbs, may be thought to prove clearly that the making of butter by churning was well known among the Hebrews. But the original words אֹלֵף הַמַּיִם, meet hehid, signify to squeeze or press; and might have been as well translated “the pressing of the milk bringeth forth milk.” And this accords better with what immediately follows, viz. “the wringing of the nose bringeth forth blood.”

It was late before the Greeks appear to have had any knowledge of butter. No mention is made of it by any of their early poets. Homer, Theocritus, and Euripides, though they frequently speak of milk and cheese, say nothing of butter; and Aristotle, in his History of Animals, at first assigns to milk only two component parts, viz. the serous and the caseous; though afterwards he remarks, as it were by the by, that there is likewise found in milk a fat substance, which, under certain circumstances, is like oil. Hippocrates, as we have already remarked, is the first Greek writer who mentions butter; and he frequently prescribes it as an external application under another name, viz. πινακιον. But Galen, who wrote in the end of the second century, does not use this term. It seems to have been of Phrygian extraction. The poet Anaxandrides, who flourished a short time after Hippocrates, describing the wedding of Iphicrates, who married the daughter of Cotys king of Trrace, and the Thracian entertainments given on that occasion, mentions the use of butter for food among these people as a matter of curiosity; a sure proof that it was not so employed among the Greeks.

Strabo, who flourished about thirty years before the Christian era, says the Lusitanians and Ethiopians used butter instead of oil. And Eolian, who lived in the end of the first century, says that the Indians employed butter to anoint the wounds of their elephants. Plutarch, who was his cotemporary, speaks of a visit paid by a Lacedemonian lady to Berenice the wife of Deiotarus, which, according to him, seems not to have been mutually agreeable; for he says the one smelled so much of butter, and the other of perfume, that neither of them could endure the other.

Dioscorides (B.C. 33,) is the first author who recommends butter as an article of diet, and says it might be melted fresh, and poured over pulse and other vegetables instead of oil, and used in pastry. He also recommends it for medicinal purposes. But Galen, who wrote at Rome about 200 years later, is much more full on the healing virtues of butter. He is surprised that Dioscorides should have said it was made of sheep’s and goat’s milk, for he himself had seen it made of cow’s milk; and such butter, he affirms, was always the fattest and best, and had from thence, he believes, derived its name. He says it may be used instead of oil in mollifying leather, and, that in cold countries which did not produce oil, butter was used in the baths, and was evidently a real fat, because, when poured over burning coals, it readily caught fire. From all this it is evident, that butter in his time must have been very little known to the Greeks and Romans.

Strabo, speaking of the ancient Britons, says, that though they had abundance of milk, some of them were so ignorant that they did not know how to make a cheese. But Pliny, on the other hand, affirms, that “the barbarous nations,” by which he usually means the Germans and Britons, not only made cheese, but likewise butter, which they used as a most agreeable food; and the use of this food was a distinguishing mark betwixt the rich and the poor. To these nations he ascribes the invention of butter, and says they made it from the milk of the goat, the sheep, and the cow; most commonly from the latter, but that the milk of the ewe produced the fattest butter. He likewise describes the form of the vessel employed by the barbarians in making it, which seems to have been not very different from what we now use. It was covered, he says, and had holes in the lid. He is the first Latin writer who mentions the word butyrum, though Vossius thinks it is to be found in Columella. Whether Tacitus by lex cureretum, which he affirms to have been the most common food of the Germans, means cheese or butter, it is impossible to determine.

The Greeks, then, seem to have derived their first acquaintance with butter from the Thracians or the Scythians, and the Romans from the Germans. Nor did either of them, after learning its nature, employ it as an article of food, but only as an ointment in their baths, and in medicine. Their agricultural writers, who treat largely of milk, cheese, and oil, as food, take no notice of butter, nor is it mentioned by Apicius. The suggestion of Dioscorides, therefore, formerly mentioned, that butter might be conveniently used in cookery, seems not to have been attended to. Fourcroy thinks, that the effect of agitation in separating butter from milk, must have been accidentally made by the Scythians or other wandering tribes while transporting their milk from place to place in skins or other vessels.

Sidonius Apollinaris informs us, that the ancient Burgundians were accustomed to besmear their hair with butter; and Clemens Alexandrinus says, that the ancient Christians of Egypt burned butter in their lamps at their altars instead of oil; a practice somewhat similar to which has been retained by the Abyssians. In the Roman Catholic churches, it was anciently allowed, during Christmas time, to use butter, instead of oil, on account of the great consumption of this in other ways. This accounts for the name “butter tower,” which we find in some places, as at Rouen, Notre Dame, and others. In 1500, George d’Amboise, Archbishop of Rouen, finding the oil fail in his diocese during Lent, permitted the use of butter in their lamps, on condition that each person should pay six deniers for the indulgence, with which sum this tower was erected.

From all the accounts of the method of making butter transmitted to us by the ancients, we have reason to think that they were unacquainted with the art of giving it that firmness and consistence, which is so valuable a quality of modern butter. They always speak of it as a liquid substance. With
them it was poured out like oil; with us it is cut and spread. Their butter was probably much inferior to ours, and its use very limited.

The processes for making butter have been various in different ages, and among different nations. The operation of churning is well known; and we have only to observe, that though churns have been constructed of different forms, they may be all reduced to two, the vertical and horizontal. The vertical, or pump-churn, as it is usually named, was probably the first thought of, and is nothing more than a tall wooden vessel, three or four feet high, narrow in proportion to its height, and strainer above than below, having a sort of piston or staff adapted to it, with a perforated head, by moving which up and down with the hands, the cream is agitated, and the butter at length formed. The utensil is sufficiently well adapted to the operation of making butter on a small scale, where the cream to be churned is the produce of a few cows only. But where dairying is managed on the great scale, and the quantity of cream large, the operation performed in this way is too tedious and laborious for general use, and methods have been contrived to expedite the process and abridge the labour. This is best done by means of the horizontal, commonly called the barrel-churn, which is a cylindrical vessel, close at both ends, and firmly fixed upon a stand, having a sort of rack or trundle adapted to it within, usually with four blades, and turned by a winch or handle, placed on its axle, passing through the ends of the churn. By this machine, as much cream may be churned in an hour as could be done in ten or twelve by the common upright churn.

In the northern parts of Africa, in Egypt, and Arabia, they churn by putting the cream into a goat's skin, turned inside out, and pressing it to and fro, in an uniform manner. Sometimes they place it on an inclined plane, permitting it to roll to the bottom, and then again replacing it to run the same course. A method which in a short time produces butter.

Dr Chandler, while travelling in Greece, observed them treading the skins thus filled with their feet; a practice which has been thought to illustrate the passage already quoted from the book of Job.

In Bengal, they churn by simply turning a stick in the milk; and that families may have the butter fresh and sweet to breakfast, it is made in this way every morning. In many parts of the East, they make butter of the milk of the buffalo; but this is by no means esteemed equal in excellence to the butter of the cow's milk. It is deficient in consistence, colour, and flavour.

With regard to the good or bad qualities of butter, a great deal has been always ascribed to the pasture of different farms or districts. Recent observations and experiments, however, showed that much less depends upon this than has been commonly imagined. The mode of management appears to be of much greater consequence. *In every district,* says Dr Anderson, *where fine butter is made, it is universally attributed to the richness of the pastures, though it is a well known fact, that take a skilful dairy-maid from that district into another, where no good butter is usually made, and where, of course, the pastures are deemed very unfavourable, she will make butter as good as she used to do; and bring one from this last district into the other, and she will find that she cannot make better butter there than she did before, unless she takes lessons from the servants or others whom she finds there.*—*" I have frequently," continues he, *known instances of this kind. And the same thing takes place in the manufacture of beer and many other articles. In matters of this sort, a very great diversity is produced by circumstances apparently of a most trivial kind."

M. Tessier, of the National Institute of France, says, *"The particular nature of Breton butter, whose colour, flavour, and consistence, are so much prized, depends neither on the pasture nor the particular species of cow, but on the mode of making. This butter is of a superior quality, because they make it of the richest cream, and usually in large quantities at a time. As soon as it is made and washed, they sprinkle it with sweet milk, spread it out in flattened cakes, larger or smaller, but rarely containing less than three, or more than six pounds; and lay it on a kind of pan, placed on hot cinders, and covered with a copper lid, on which are put cinders also. It remains there some minutes, more or fewer according to the bulk of the cake."*

This mode of managing butter appears from him to be a secret in certain families, and to require practice and dexterity to conduct it with success.

Still, however, we are disposed to believe that certain pastures are more favourable to the production of good butter than others. Certain plants, such as turnip, wild garlic, hemlock, rough-leaved dandelion, charlock, and may-weed, are known to affect milk with a disagreeable flavour, and there may be many others which, to a certain degree, impair its goodness, though their effects are by no means so evident. Far more, however, depends on good management than on this circumstance, or even on the species of cow we feed; for that something, likewise, is owing to this, is equally well ascertained. Cows have been found whose milk could not be brought to yield any butter at all.

It has been long remarked, that the butter in the Highlands of Scotland, when properly made, possesses a peculiarly rich and delicate flavour; and this has been almost universally attributed to the old grass on which the cows feed in these remote glens. But what more common error than to mistake a concomitant circumstance for a cause? Dr Anderson, by his experiments on milk, has shown that the excellence of the Highland butter may be very reasonably ascribed to a quite different cause. He has proved that the cream of a given measure of milk constantly increases in quantity, and still more in quality, from the first drawn tea-cup full, to the last drop that can be squeezed from the udder at the time. *"Probably,"* says he, *"on an average of a great many cows, the proportion of the cream obtained from a given quantity of the last drawn milk, may be to that of the cream obtained from an equal quantity
of the first drawn, as ten or twelve to one; but the quality of the cream of the last drawn was still more superior than its quantity. The cream of the first drawn tea-cupful of the milk was only a thin white film; in the last, it was of a thick butyrous consistence, and of a glowing richness of colour, such as no other cream possesses. It is, therefore, observes Dr Anderson, of much more importance than is commonly imagined, to milk the cows well; for on the cream of the last drawn milk depends entirely the richness and delicate flavour of the butter." Now, in the Highlands of Scotland, where they rear almost all their calves, the common practice is to admit the calf to suck the mother always for a certain time before milking. And when the dairy-maid judges the calf has had enough, it is removed to the pen or cruiser, from which it had been brought. In this way, the latter drawn parts of the milk only are obtained for the dairy; and the cream produced from it being of a superior quality, the excellence of the Highland butter seems to be accounted for. In the higher districts of Galloway, a similar mode of management prevails, and their butter is observed to be rich and delicate. It has been likewise ascertained, that the cream which first rises after the milk has been deposited in the dairy-pan, is both much greater in a given space of time, than that which rises in an equal space several hours after, and of a greatly superior quality; that thick milk throws up less cream than thin, but of a richer quality; and that milk that has been much agitated by carrying, and cooled before it is put into the milk-pan, never throws up so much cream, as that which is immediately deposited in them after milking. It is also known, that the milk is not at the best till about four months after the cow has calved; and that the degree of heat most favourable to the production of cream from milk, is from 50 to 55 degrees of Fahrenheit's thermometer. "If the heat of the milk-house," says Dr Anderson, "be too great, the milk suddenly coagulates, without admitting of any separation of the cream; or it is so quickly turned sour, as greatly to mar the operation. If, on the other hand, the milk be exposed to too cold a temperature, the cream separates from it slowly, and with difficulty; it acquires a bitter and disagreeable taste; the butter can scarcely be made to come at all; and when it is come, it is so pale in the colour, so small in quantity, and of such hard and brittle consistence, so poor to the taste, and of so little value in all respects, as to bring a very low price at the market, compared to what it would have produced, had it been preserved in a proper degree of heat." The same judicious writer states it as his opinion, formed from experience and attentive observation, that since neither cream nor butter can be produced from milk, till some portion of an acid be evolved in it, the last drawn half of the milk only should, in general, be set up for producing cream, and be allowed to stand till it throw up the whole of its cream, even till the milk tastes perceptibly sourish; and that if this cream be afterwards judiciously managed, the butter thus obtained will be of a greatly superior quality to what can be usually got at market, and its quantity not considerably less, than if the whole of the milk had been originally set apart for producing cream. "This, therefore," says he, "is the practice that I should recommend, as most likely to suit the frugal farmer; as his butter, though of a superior quality, could be afforded at a price that would always ensure it a rapid sale."

Cows, in summer, should be milked three times a-day at least; early in the morning, at noon, and just before night-fall. If this be not done, the greatest possible quantity of milk will be far from being obtained from them. The milk is secreted in theudder, very much in proportion to the quantity required, as we see in the case of dogs, cats, pigs, and other animals, which produce more young than one at a time; and we know that a cow, by scanty milking, can very soon be put dry. It is therefore of the utmost consequence, that the whole milk secreted be at each milking carefully drawn away. It may be laid down as a pretty general rule, that 16 pounds of milk will yield one pound of butter; and that this is the produce of a single cow per day. Some, however, will furnish twice, or even thrice this quantity. The effects of feeding, treatment, management, and the idiosyncrasy of particular animals, are here astonishingly great.

From 12 to 20 hours in summer, and about twice as long in winter, should be permitted to elapse before the milk is skimmed, after it has been put into the milk-pan. If, on applying the tip of the finger to the surface, nothing adheres to it, the cream may be properly taken off; and during the hot summer months, this should always be done in the morning, before the dairy becomes warm. The cream should then be deposited in a deep pan, placed in the coolest part of the dairy; or in a cool cellar, where free air is admitted. In hot weather, churning should be performed, if possible, every other day; but if this is not convenient, the cream should be daily shifted into a clean pan; and the churning should never be less frequent than twice a-week. This work should be performed in the coolest time of the day, and in the coolest part of the house, where there is a free draught of air. Cold water should be applied to the churn, first by filling it with this, some time before the cream is poured in, and then by immersing it in water to the depth of a foot or so, during the operation, provided we use the pump-churn; or by applying wet cloths to it, if we use a barrel-churn. Such means are generally necessary to prevent the too rapid acidification of the cream, and formation of the butter.

The winter season and cold weather, of course, require an opposite practice; but we can hardly be too cautious in the application of heat; for the common practices of wrapping the churn in a warm cloth, plunging it into hot water, adding warm milk to the cream, or placing the churn near the fire, all tend to injure the butter. The best way, perhaps, is to heat the churn, by filling it with boiling water before the cream is put in, and to place it in the warmest part of the house; but not close by a fire.

The operation of churning ought to be moderate, equal, and uninterrupted; for if we stop or relax in our exertions, the butter will go back, as it is called; and if the motion be too quick and violent, the
butter will imbibe a very disagreeable flavour. This, in some districts of Scotland, is known by the phrase
bursting the churn.

Machinery, as before observed, of an ingenious and convenient construction, is in some districts now employed, and found to have the advantage, not only of abridging labour, but of securing a more regular and uniform motion.

When the operation is properly conducted, the butter, after some time, suddenly forms, and is to be carefully collected and separated from the butter-milk. But in doing this, it is not sufficient merely to pour off this milk, or withdraw the butter from it; because a certain portion of the casings and ser- rous parts of the milk still remain in the interstices of the butter, and must be detached from it by wash- ing, if we would obtain it pure. In washing butter, some think it sufficient to press the mass gently be- twixt the hands; others press it strongly and fre- quently, repeating the washings till the water come off quite clear. The first method is preferable, when the butter is made daily for immediate use, from new milk or cream; because the portions of such adhe- ring to it, or mixed with it, contribute to produce the sweet agreeable flavour which distinguishes new cream. But when our object is to prepare butter for keeping, we cannot repeat the washings too often, since the presence of a small quantity of milk in it, will, in less than 12 hours after churning, cause it sensibly to lose its good qualities.

The process of washing butter is usually nothing more than throwing it into an earthen vessel of clear cool water, working it to and fro with the hands, and changing the water till it come off clear. A much preferable method, however, and that which we believe is now always practised by those who best understand the business, is, to use two broad pieces of wood instead of the hands. This is to be pre- ferred, not only on account of its apparently greater cleanliness, but also because it is of decided advan- tage to the quality of the butter. To this the warmth of the hand gives always more or less of a greasy appearance; and butter washed by means of the wooden flappers, as they are called, will always fetch at market a higher price than if the hand had been employed. The influence of the heat of the hand is greater than might at first have been sus- pected. It has always been remarked, that a person who has naturally a warm hand, never makes good butter.

After washing, the butter should be cut and eli- ced in every possible direction, with a serrated or rough-edged knife, in order to bring out from it the smallest hair, bit of rag, strainer, or any thing that may have chanced to fall into it. It is then to be spread in a bowl, and such a quantity of salt added as may be judged proper. If the butter is to be used immediately, or kept only for a short time, a small proportion will be sufficient; and in this state it is usually denominated fresh butter. But if it be in- tended to be long kept, or transported to a distance, an ounce or two of salt will be required to the pound of butter. The salt used in curing butter should be of the purest kind, well dried, and broken down, but not completely pulverized; and it must be so tho- roughly worked in, as to be equally incorporated with the mass.

When butter is to be sold on the spot, or in the neighbouring markets, it is divided into rolls of a pound, or half a pound; or into lumps of 24 ounces, called dishes in some parts of England; but when it is to be kept, or carried to a distance, quantities of 84, 56, or 28 pounds, are put up together in casks, usually called tubs, firkins, and half firkins.

When the butter has been sufficiently impregnated with the salt, by being spread out in thin layers, sprinkled with it, and thoroughly wrought, it is then to be gently pressed into the tub or firkin, which must not, however, be filled quite up, but room left at top to receive a layer of salt, half an inch or an inch in thickness. In seven or eight days, the salted butter detaches itself from the sides of the firkin, shrinks, and occasions interstices. These, if allowed to remain, would injure the butter, by admitting the contact of the air. They are, therefore, to be filled up by a saturated solution of salt in water, or brine strong enough to carry an egg. The butter is then to be covered by a new layer of salt, and the head of the vessel put on.

Before the butter is put into the firkin, care must be taken that the latter be well seasoned: and this is effected by exposing it for two or three weeks to the air, and frequent washing. The readiest method, however, is by the use of unslaked lime, or a large quantity of salt and water well boiled, with which it should be scrubbed several times, and afterwards thrown into cold water, to remain three or four days till wanted. It should then be scrubbed as before, and well rinsed with cold water; and before receiving the butter, every part of the inside of the firkin must be carefully rubbed with salt. Indeed, the surest of all methods to preserve butter from spoiling, after it has been properly salted, is to keep it constantly im- mersed in a saturated solution of this substance. A friend of the writer of this article informs him, that he has preserved butter in this manner at sea for a very long period. It might deserve attention, to try to discover a species of wood that would not commu- nicate any taste to the butter.

An excellent composition for preserving butter may be prepared, by mixing one part of saltpetre, one of common salt, and two of sugar. This thoro- roughly wrought into the butter, will keep it sweet for a very long time, and communicates to it no salt or disagreeable taste.

When butter is to be exposed to the heat of a warm climate, it should be purified by melting, before it is salted and packed up. Let it be put into a proper vessel, and this into another containing water; let the water be gradually heated till the butter be thoroughly melted; let it continue in this state for some time, and the impure parts will subside, leaving at the top a perfectly pure transparent oil. This, when it cools, will become opaque, and assume a co- lour nearly resembling the original butter; being only a little paler, and of a firmer consistence.

This refined butter must be separated from the dregs, salted, and put up in the same way with other butter; and it will keep much longer sweet in hot climates, as it retains the salt better. It may also be
preserved sweet, without salt, by adding to it a certain proportion of fine honey, and mixing them thoroughly, so that they may be perfectly incorporated. A mixture of this sort has a sweet pleasant taste, and will keep for years without becoming rancid. It might of course be very useful in long voyages. Dr Anderson thinks an ounce of honey sufficient to preserve a pound of butter.

To preserve butter for a long time fresh without any foreign mixture, the best method perhaps is, first of all to wash the butter-milk completely out, and then to keep the butter under pure cool water, frequently renewed. Some wrap it up in a wet linen cloth, to defend it from the influence of the air. But though fresh butter be kept cool and from the air, it will in no very long time become rancid. We cannot by any means keep it fresh from one year to another, or transport it to a distance in good condition. Rancid butter, to most people, is extremely disagreeable. A very small quantity of it will be observed by many in a large mass of milk that it may have been employed to season. Few stomachs can digest rancid butter. Some are so delicate, that the use even of fresh butter, of milk, of cream, and in general of all oleaginous substances, affect them with difficult and painful digestion.

Butter, to be a wholesome aliment, must be free from rancidity, and not fried or burned. But even in its purest state, there are few who can indulge very freely in the use of this article with impunity; and health, perhaps, would not suffer, though its employment as food were altogether laid aside. Like the other bland oils, it is gently laxative. Most housewives know several receipts for restoring rancid butter to freshness. But of these the greater number are of little use. Washing it well with pure water, or with ardent spirit, still better perhaps with sweet milk, will deprive it in some measure of its disagreeable smell and taste. It is of much more consequence to preserve butter from becoming rancid, by salting, and the other means already explained.

As turnip is now become so common a food for cows, and often imparts to their milk, and the butter thence made, a very disagreeable flavour, it is of some consequence to know how this may be best obviated. A small quantity of saltpetre has been recommended; and in the *Georgical Essays*, vol. v. we have the following method: "Let the bowls or pans be kept constantly clean, and well scalded with boiling water before using." When the milk is brought into the dairy, to every eight quarts mix one quart of boiling water; then put up the milk into the bowls to stand for cream." Dr Anderson says, "that if the milk is to be used sweet, its taste may be considerably diminished by boiling; and that other means of sweetening milk have been attempted, more troublesome and expensive, and not more efficacious."

As butter made in winter is generally pale or white, and its richness at the same time inferior to that which is made during the summer months, the idea of excellence has been associated with the yellow colour. Means are therefore employed by those who prepare and sell butter, to impart to it the yellow colour where that is naturally wanting. Various substances have been used for this purpose, but they must all be of the resonious class, or such as are soluble in oils. Extractive matters, and such as are soluble only in water, alcohol, &c. as beet-root and cochineal, give no tinge to butter. The substances most commonly employed are the root of the carrot, and the flowers of the marigold. The juice of either of these is expressed and passed through a linen cloth. A small quantity of it, (and the proportion necessary is soon learned from experience,) is diluted with a little cream, and this mixture is added to the rest of the cream when it enters the churn. So little of this colouring matter unites with the butter, that it never communicates to it any peculiar taste.

Many other colouring matters have been employed, as saffron, the berries of the phylsalis alkekengi, the seed of the asparagus; but the marigold and carrot are certainly the best, and it is the latter that is chiefly used by the best farmers.

Alkanet root will give every shade of colour to butter, from the lightest rose to the deepest red, by augmenting or diminishing the proportions of it.

Though the milk of the cow, when fed on rich pasture during the summer months, is almost always found to produce butter of a rich yellow colour, this is by no means the case with every animal. The goat, the sheep, the mare, and the ass, fed on the same pasture in the same season, produce milk which yields butter always more or less white.

Butter, as an article of commerce, is of considerable importance. Some compute that there are 112,000,000 pounds of it annually consumed in London, chiefly made within 40 miles round the city. From the three counties of York, Cambridge, and Suffolk, there are annually sent to the capital 210,000 firkins, amounting to 11,760,000 pounds.

Some counties or districts are particularly famous for the excellency of their butter. That which is made in Essex, and well known under the name of Epping butter, is the most highly esteemed of any in London and its vicinity. In the more restricted use of this appellation, it is applied only to the butter made from the milk of cows which are fed in Epping forest during the summer months, where the leaves and some particular plants are thought to contribute to its superior flavour. In Somerset butter of nearly the same excellence is made; but brought to market in half pounds instead of pounds.

The Cambridgeshire salt-butter is held in the highest esteem. And the London cheesemongers, by washing and detaching the salt from it, often sell it at a high price for fresh butter. It is made nearly in the same way as the Epping butter, and when salted, put up in firkins of 56 pounds. Yorkshire and Suffolk butter is very little inferior to that of Cambridgeshire, and is often sold in London for such. Uttoxeter, in Staffordshire, has long been famous for

* It can hardly be necessary to observe, that the utmost attention to cleanliness, with respect to every vessel and instrument used, and every operation performed in the making of butter, is indispensably requisite. Any neglect of this kind is fatal to its goodness. It is quite necessary that the bowls or pans, after washing, be allowed to cool before the milk is put into them.
good butter. The London cheesemongers have a sort of factory there for this article. It is bought by the pot, of a cylindrical form, weighing 14 pounds. The superior excellence of the butter produced in the Highland districts of Scotland, has been already remarked, and we hope accounted for. The same delicately flavoured species is said to be made on the mountains of Wales, and the heaths and commons of England. Whether the same reason will apply here, we have no means of ascertaining.

Frauds and abuses of various kinds are practised in the salting and packing of butter, to increase its bulk and weight. Pots are frequently laid with good butter for a little way at the top, and with bad at the bottom. Sometimes the butter is placed in upright rolls, touching one another above, so as to form a uniform surface, but receding so as to leave empty spaces below. Sometimes tallow or hog's-lard is found to constitute no small proportion of what the purchaser had deemed good butter. To prevent these cheats, the factors at Uttoxeter keep a surveyor, who, in case of suspicion, tries the pots with an iron instrument, called a butter-bore.

An act of parliament (36th Geo. III. c. 86,) particularly regulates the packing, salting, and selling of butter. By that statute it is enacted, that every vessel made for the packing of butter, shall be of good well-seasoned wood, marked with the maker's name, and, by a subsequent act, his place of abode; that it shall be a tub containing 84, a firkin containing 56, or a half firkin containing 28 pounds avoirdupois, and no other; that it shall be of a particular weight, and neither top nor bottom exceeding a certain thickness, having the true weight or tare of the vessel, distinctly marked upon it; with a variety of other regulations to prevent frauds, under severe penalties. Any fraud with regard to the butter, the vessel, or its marks, subjects the person concerned to a forfeiture of L. 30 for every such offence. See Fourcroy Système des Connaissances Chimiques, tom. ix. Deyeux and Parmentier, Memoire sur le lait. Thomson's Chemistry. Anderson's Agricultural Recreations, vol. iii. and iv. BUTTERMERE. See Cumberland.

BUTTNERIA, a genus of plants of the class Pentandria, and order Monogynia. See Botany, p. 153.

BUTTON MANUFACTURE. It will, perhaps, excite some surprise, among persons unacquainted with manufactures, that the fabrication of such trifling articles as buttons should give employment to many thousands of the inhabitants of Birmingham, Sheffield, and other large towns in Great Britain; and that several very curious and expensive machines are used to lessen the manual labour.

The manufacture of buttons is divided into several kinds, the formation of each of which is a distinct business; the manner of fabricating them varying as greatly as the materials from which they are made. Horn, leather, bone, and wood, are the substances generally employed for buttons which are either plain, or covered with silks, molhair, thread, or other ornamental materials. The most durable and ornamental buttons are made of various metals, polished, or covered with an exceeding thin wash, as it is termed, of some more valuable metal, chiefly tin, silver, and gold.

Those buttons intended to be covered with silk, &c., are termed, in general, moulds. They are small circles, perforated in the centre, and made from those refuse chips of bone which are too small for other purposes. These chips, which, for the large and coarser buttons are pieces of hard wood, are sawn into thin flakes, of an equal thickness; from which, by the machine, as delineated in Plate CVII. Fig. 1, the button moulds are cut out at two operations. The lathe, as usual, is put in motion by a wheel A turned by the foot, by means of a treadle B, and crank a. The strap e gives a rapid rotatory motion to the spindle D, mounted on its pivot in an iron frame. One end of the spindle has a tool b, shewn enlarged at L, screwed into it, and moving along with it; and the other extremity of the spindle is connected by a peculiar kind of joint, with a lever c, whose fulcrum is e; the other end f being connected with a second lever and handle g, which the operator holds in his left hand. The right hand is, at the same time, employed in holding the flake of bone d opposite the tool b, against a piece of wood firmly fixed into the iron standard E by two screws; then, by drawing the handle g forwards, the tool b being at the same time in rapid motion by the foot wheel, its centre pin k (see the separate view at L) is pressed against the bone, and drills a hole through in the centre of the intended button; and its two points h, h describe a deep circle in the bone, about half through its thickness. The flat surface is cut smooth by the parts m, m of the tool. The piece of bone is now moved a small distance, to cut out another button from a fresh part; and when as many as the flake of bone will contain are thus cut half through, the other side is presented to the tool. The point k is inserted into the hole made from the other side by the former operation. The two teeth h, h of the tool now cut another deep circle, exactly opposite the former, at the same time cutting the flat surface smooth. By this means the bone is cut through, and a button mould left sticking on the point of the tool. By drawing back the handle g the tool recedes, and the button meeting a fixed piece of iron plate, is forced off the tool, and falls into a small box at F, completely finished. Another part of the bone is now presented to the tool, to cut out another mould. These operations are conducted with such rapidity, that a girl of ten or twelve years of age is enabled to cut out twenty-five or thirty buttons per minute. The larger kind of buttons are first cut from the pieces of bone, and the smaller ones are afterwards made from the spaces left between the first; so that the materials are made to yield the utmost to the button-maker, and the remains are afterwards sold to farmers for manure. The shavings, sawdust, and more minute fragments, are used by manufacturers of cutlery and iron toys, in the operations of case hardening; so that not the smallest waste takes place. Hard wood is cut into buttons in the same manner, and afterwards dyed black in an infusion of sulphate of iron and gall nutes. Oak, beech, or elder, is chiefly used, but only for large buttons, all the smaller kinds being made of bone.
Button moulds are only used at present for the purpose of sewing up in a piece of the same cloth as the garment to which they are attached. They were formerly covered with the most costly materials, by women, who were seated round a table, and each had a large needle fixed in the table opposite the part where she was seated, and also a bobbin, containing the thread to cover the button. The mould was stuck by the hole in its centre upon the needle, and the end of a thread of silk, mohair, and sometimes gold thread, put through the centre at the same time, to fasten one end; the thread was then wound about the button mould to cover it, and present an ornamental surface, such as the fashion of the day, or the fancy of the maker directed. As this art is now obsolete, one pattern, Figs. 2, 3, and 4, from many thousands in vogue thirty years since, will give an idea of the disposition of the covering. Fig. 2, is the button just beginning to be covered; Fig. 3, the same in an advanced stage; and Fig. 4, is a finished button. The thread being fastened at the centre in the back, (see Fig. 2.) is brought to the circumference on the dotted line 1, and wound across the front, as shown at 2. It then passes behind again, on the dotted lines 3, and in front at 4; across the back on the dotted line 5, in front at 6; and passing behind on the line 7, is laid in front at 8; making a complete square in front. By continuing this process, and laying the threads beside each other, the square becomes less, as in Fig. 3; where the Numbers 9, 10, 11, 12, 13, 14, 15, 16, again denote the progress of the thread, which alternately passing over and under the former folds, the intersections form the appearance which begins to be visible at the angles a, b, c, d. As more thread is wound on the four sides of the square, 10, 12, 14, and 16 meet round the centre pin, and the mould is completely covered, as in Fig. 4. The end of the thread is fastened by sewing it through the centre; and, in some cases, by placing a small ornament upon it. In others, a number of the last folds which are wove round the needle upon which the mould is fixed, and therefore do not perfectly unite in the centre, are drawn together by passing the thread round them before it is sewed through the centre. At the back, a great number of the folds of thread are taken up and tied together by a strong thread, to serve the purpose of a shank to sew the button to the garment: This, at the same time, prevents the folds of thread at the back from slipping over the edge of the mould. In this state the common buttons were finished: but the finer kinds were afterwards ornamented with wire, or threads covered with silk or gold, woven in the threads of the plain button, in various fantastic patterns; one of which is shewn in Fig. 5. Sometimes the moulds were sewn up in pieces of cloth elegantly wove of gold, silk, white horsehair, &c. and ornaments in gold or silver were sewed on the surface. All such buttons were, after covering, exposed in a sort of cullender over the flame of burning spirits of wine, to remove the small filaments of silk projecting from their surface, and render them smooth: the workman keeping them in constant motion during this process, to avoid burning or damaging the buttons. They were afterwards cleaned, by shaking a great number in a bag with crumbs of bread: this took off the end of the singed fibres, rendering them glossy, and ready for sale.

Horn buttons are made sometimes with shanks fixed in them; and others, called Sailor's Buttons, are fastened to the garment by sewing through four holes made in them for that purpose and the surface is concave in front, to preserve from wearing the thread by which they are sewed. They are made from cow-hoofs, by an ingenious process of pressing them into heated iron moulds. The hoofs being boiled in water till they become soft, are cut into parallel slips by a cutting knife, which is a blade, with a long handle at one end, and jointed to the bench by a hook and eye at the opposite extremity. It then acts like a lever in cutting the horn placed beneath its edge. The slips being the width of the diameter of the intended button, are cut across into small squares; and the angles of these being cut off, leaves octagonal pieces nearly the size of the intended buttons. These are dyed black, by dipping them into a cauldron of water impregnated with logwood and copperas. After being dried for a week, they are then ready for pressing between the moulds; Fig. 6, which consist of two plates of iron a, a, united by the joint of the handles b, b, to open and shut. Each plate a, a has six, eight, or twelve small steel dies fastened to it, each die containing the impression of the intended buttons embossed in it. When shut close, these impressions exactly correspond. The two claws c, c enter corresponding cavities in the opposite plate, and insure them coming accurately together. The presser, being provided with a great number of different moulds, arranges them in an oven or furnace, till they become heated somewhat above the heat of boiling water. A piece of horn is then placed upon each impression in the mould, which is shut close, and the mould is placed in a small screw press fixed to the work bench, which holds the moulds shut together for a few minutes, till the horn is warmed and softened by being between them. The mould is now carried to the pressing vice, Fig. 7, which consists of two massive vice. Fig. 7.

Pressing.

The fashions, or edges of the buttons, which did not enter into the cavities of the dies, are now clipped off by shears, and are then filed smooth and round in a lathe, consisting of a spindle like that in Fig. 1, and another nearly the same, placed exactly in the same line, but opposite to the former. Both are turned with the same velocity, by straps from two equal foot-wheels on one axis. The ends of the two spindles come in contact, and have chucks, with a cavity
in each for the reception of the button. The spindle, like D, is pressed forwards by a spring applied to the lever e, so as to hold the button fast between them, and turn it round while it is filed. When a button is finished, the attendant, without stopping the lathe, pushes the handle $g$, Fig. 1., which separates the spindle, and the button drops into the box F beneath; another is put in, and held fast to be turned round the moment the handle $g$ is released. Some horn buttons have shanks, which are put in before they are pressed, by children, who drill a small hole in the horn, and insert the shank. The mould has, of course, a cavity to receive the shank; and the pressing closes the horn about it so effectually, that it will not come out. The manner of making these shanks will be soon described. Other buttons, called sailors' buttons, have in place of shanks four holes drilled through them, by presenting them to a lathe, the upper part of which is shown Fig. 8. It has four parallel spindles $a, a, a, a$, all turning together by a foot-wheel, by means of two straps $e, f$, each of which turns two spindles. At the end of the four spindles, is a hook, uniting them with four other spindles $b, b$, which are supported by passing through holes in a metal standard A; and their points projecting beyond this, are formed into small drills. The spindles A are necessarily placed at some distance asunder, to admit the pulleys for the straps, but the hooks acting as universal joints, allow the ends of the drills to come very near to each other. The button is placed in a concave rest B, and thrust against the drills by a piece of wood. The standard A can be changed for another with more distant holes, to suit larger buttons; and the rest B can be elevated or depressed for the same purpose. The frame and foot-wheel are similar to Fig. 1. The roughness produced by drilling these holes, is removed by shaking a number of buttons in a flannel bag. In horn buttons the pattern is formed by the impression of the moulds; but some plain horn buttons are very prettily ornamented after pressing, by holding over them a thin plate of brass, which has a pattern cut out in it, then rubbing the button with dry emery powder, the face of the button is scratched to a dead colour where the brass plate is cut out, leaving the figure of the pattern in a fine black polished surface. The horn-pressor's chips are sold for manure, for almost the same price as the same quantity of the hoofs costs; other chips are used to make hartshorn; and the drill-dust and filings are used by file-makers, in hardening these articles.

Metal buttons are formed of an inferior kind of brass, pewter, and other metallic compositions: the shanks are made of brass or iron wire, the formation of which is a distinct trade. The buttons are made by casting them round the shank. For this purpose, the workman has a pattern of metal, consisting of a great number of circular buttons, connected together in one plane, by very small bars from one to the next; and the pattern contains from four to twelve dozen of buttons, of the same size. An impression from this pattern is taken in sand, in the usual manner; and shanks are pressed into the sand in the centre of each impression, the part which is to enter the metal being left projecting above the surface of the sand. The buttons are now cast from a mixture of brass and tin; sometimes a small proportion of zinc is added, which is found useful in causing the metal to flow freely into the mould, and make a sharp casting. When the buttons are cast, they are cleaned from the sand by brushing; they are then broken asunder, and carried to a second workman at the lathe, who inserts the shank of a button into a chuck of a proper figure, in which it is retained by the back centre of the lathe being pressed against the button with a spring. The circumference is now, by filing it as it turns round, reduced to a true circle; and the button is instantly released, by the workman's holding back the back centre, and is replaced by another. A third workman now turns the back of the button smooth, in a chuck lathe, and makes the projecting part round the shank true; and a fourth renders the face of the button smooth, by placing it in a chuck, and applying the angle of a square bar of steel across its centre. As this tool is used without any rest, much time is saved by the workman not being necessities to turn the button perfectly flat; as the tool, being only held in the hand, will accommodate itself to a trilling deviation from the truth. The sixth operation is polishing the buttons. The shanks are held in a piece of wood, and the face is rubbed on a board covered with leather, and spread with powder of rotten stone and oil, and afterwards with a finer powder. The last polish is now given by applying the button lightly to the flat surface of a buff or circular board, turned by the lathe; it is covered with soft leather, and dressed with exceedingly fine powder of rottenstone. These polishings are performed by women, and finish the buttons, except that they are to be boiled or rendered white. For this purpose, melted tin is poured into cold water, and by this means granulated. A quantity of cream of tartar, diluted with water, is put into a boiler, and the tin added to it; the boiling causes part of the tin to be dissolved; and the buttons being let down into the liquor upon a wire grating, part of the tin attaches itself to the surface of the buttons, rendering them white, and retaining their former polish. This method of washing with tin is very good, and the wash remains a long time upon the buttons.

Gilt Buttons are stamped out from copper, (having Gilt but sometimes a small alloy of zinc,) laminated in the tons. flating mill to the proper thickness. The stamp is urged by a fly-press, which cuts them out at once stroke. These circular pieces, called blanks, are annealed in a furnace, to soften them; and the maker's name, &c. is struck on the back by a stamp, which is a machine very similar to a pile engine. The stamp also renders the face very slightly convex, that the buttons may not stick together in the gilding process.

The shanks are next to be soldered on. For this Soldering purpose, each blank is provided with a small spring, similar to a pair of tweezers, which holds a shank down in a proper position upon each; a small quantity of spelter and borax, mixed together with water, is placed round each shank, and ten or twelve dozen in this state are introduced, upon a large iron shovel, or peel, into an oven, heated sufficiently to fuse the solder. When this happens, they are withdrawn from
the oven, and while warm are thrown into aquafortis and water (called pickle). This raises a black oxide upon the surface of the metal; and in this state the edges of the buttons are turned in the same manner as the metal buttons before described: but as the blanks are sufficiently smooth, it is unnecessary to turn the face or back, and they only require to be dipped cold into a second pickle, composed of nitric acid and water, weaker than the former, to remove the black scale. After this, instead of the pickling which metal buttons undergo, they are burnished in the lathe, to render the surface smooth, and close up the pores of the metal previous to gilding. The burnishing is performed by a hard black stone, called blood-stone, fixed into a handle, and applied to the button as it revolves by the motion of the lathe. The blood-stone is of the class hematites, a peculiar species of iron ore. It is found occasionally in the gravel and alluvial mixtures on the surface of various places in and near Derbyshire, viz. Ashborne, New Haven, Spoonden; at Norris Hill and Ashby Wolds in Leicestershire; in the dry courses of the underground rivers above Ilam in Staffordshire; and at Boythorpe in Nottinghamshire.

Gilding. A great number of the buttons, thus prepared for gilding, are put into an earthen pan, with the proper quantity of gold to cover them,* amalgamated with mercury in the following manner: The gold is put into an iron ladle, and a small quantity of mercury added to it; the ladle is held over the fire, till the gold and mercury are perfectly united. This amalgam being put into the pan with the buttons, as much aqua fortis, diluted with water, as will wet them all over is thrown in, and they are stirred up with a brush, till the acid, by its affinity to the copper, carries the amalgam to every part of its surface, covering it with the appearance of silver. When this is perfected, the acid is washed away with clean water. This process is by the workmen called quicking.

Drying off. The silvered buttons are now put into a large frying-pan, which is placed on a fire, and is continually shaken, to heat them equally; which soon occasions the mercury to appear as if melting. When this appearance takes place, the buttons are put into a cap made of felt, like a large cap without a brim, and are stirred about with a brush, to spread the gold contained in the mercury equally over all the surface, while the latter is so hot as to be nearly volatile. The buttons are now returned to the pan, and the heat causes the mercury to fly off in vapour; the buttons beginning to turn yellow, from the gold discovering itself as the mercury dries off. The buttons are a second time worked in the cap during the process, and returned to the pan to complete them. Sometimes they will not dry off completely in the pan, small spots remaining white on the buttons; but these are removed by putting the buttons into a cylindrical copper box with a lid, which is laid on a small charcoal fire, and turned round by a pair of tongs, to heat all parts equally. When taken from this box, the gilding is finished, the buttons being of a fine yellow colour, but without any polish. This is given by burnishing them in a lathe, the spindle of which revolves with an immense velocity. A button is slipped into a chuck which exactly fits it; a blood-stone, fixed in a handle like a glassier's diamond, is dipped in water, and being applied to the button as it revolves, brings it to a polish in an instant. The button does not fit the chuck so accurately as to prevent it from slipping out by the action of the burnisher, if the workman did not apply his fore-finger to the opposite side of the button, to keep it in. He has a piece of soft leather sewed round his finger, to obviate the effects of the friction; and this leather being wetted with water, prevents the blood-stone from attracting the gold, as it would otherwise do. A second finer blood-stone is next applied, and this finishes them. When the workman removes his finger, the button drops out of the chuck; but if it is not perfectly burnished, he can return it in an instant without stopping the lathe. The buttons pass through the hands of three workmen to burnish them: The first burnishes the back; the next burnishes the edge, for which purpose his lathe has a chuck something like a vice, which receives the shank; and he is obliged to stop the lathe every time before he puts in the button. The third workman polishes the face, in the manner above described, which finishes them, if they are plain gilt buttons.

Some of these buttons are afterwards ornamented with concentric circles, of an appropriate pattern, described on the face. This is done in the lathe, by applying a milling tool. The milling tool is a small steel roller, having the intended pattern engraved on its periphery. It is held in a simple slide rest, which makes the circles on the next button that is done of the same size as those of the preceding one. Some gilt buttons are ornamented by milling on the edge, which is done in the same way, and by a similar machine to that which is used for milling the edge of coins. Double gilt buttons are gilt twice over, in the manner before described.

The process of gilding buttons, or the drying off, is exceedingly pernicious to the operator, as he inhales the vapour of the mercury, which is well known to be a violent poison. In order to obviate this, the following apparatus, Fig. 9, has been employed with success, by Mr Mark Sanders, an eminent button manufacturer at Birmingham, for drying off buttons, and at the same time preserving the mercury evaporated in the process. It is thus described in the Philosophical Magazine, vol. ix.: A hearth or fireplace, of the usual height, is to be erected; in the middle of which, a capacity for the fire is to be made; but instead of permitting the smoke to ascend into the top A, made of sheet or cast iron, through which the mercury is volatilised, a flue for that purpose should be conducted backwards to the chimney B. An iron plate, thick enough to contain heat sufficient to volatilise the mercury, is to cover the fireplace at the top of the hearth C. There must be

* By act of parliament, five grains of gold are allotted for the purpose of gilding 144 buttons; though they may be tolerably well gilt by half of that quantity. In this last case, the thickness would be about the 214,000th part of an inch. See Dr Thomas Young's Natural Philosophy, vol. ii. p. 378. En.
an ash-hole D under the fire-place. The dark square space E, seen in the fire-place, is the due which serves to carry the smoke back under the hearth into the chimney B. The door of the fire-place, and ash-pit, may either be in front or at the end of the hearth at F, which will perhaps less inconvenience the work people. The space between A, and the iron plate C, is covered up with a glass window, coming down so low as only to leave sufficient room for moving the pan backwards and forwards with facility. If the sides were also glass instead of brickwork, it would be still better; as the work people would be able to have a full view of their work, without being exposed to the fumes of the mercury, which, when volatilized by heat communicated to the pan by the heated iron plate over the fire-place, ascends into the top A, appropriated for its reception, and descends into the tube G, covered at top, and filled pretty high with water. By this means, the hearth would in fact become a distilling apparatus for condensing and recovering the volatilised mercury. In the tube G, the principal part would be recovered; for, of what may still pass on, a part would be condensed in ascending the tube H, and fall back, while the remainder would be effectually caught in the tube or cask I, open at the top and partly filled with water. The latter tube should be on the outside of the building, and the descending branch of the tube H should go down into it at least 18 inches, but not into the water. The chimney or ash-pit should be furnished with a damper to regulate the heat of the fire.

The water may be occasionally drawn out of the tube by a siphon, and the mercury, clogged with heterogeneous matter, may be triturated in a piece of flannel till it passes through, or placed in a pan of sheet iron, like a dripping-pan, in a sufficient degree of heat, and having such an inclination, that the mercury, as it gets warm, may run down and unite in the lower part of the pan. But the mercury will be most effectually recovered, by exposing the residuum left in the flannel bag to distillation, in a retort made of iron or earthen ware.

Plated buttons are stamped by the fly-press, out of copper plate, covered on one side with silver, at the flattening-mill. The copper side is placed upwards in stamping, and the die or hole through which they are stamped, is rather chamfered at its edge, to make the silver turn over the edge of the button. The backs are stamped in the same manner as the gilt buttons. The shanks are soldered on with silver solder, and heated one by one in the flame of a lamp, with a blow-pipe, urged by bellows. The edges are now filed smooth in the lathe, care being taken not to remove any of the silver which is turned over the edge. They are next dipped in acid to clean the backs, and boiled in cream of tartar and silver, to whiten the backs; after which, they are burnished, the backs being first brushed clean by a brush held against them as they revolve in the lathe. The mode of burnishing is the same as for gilt buttons.

_Cup buttons_, either plated or gilt, are made of two pieces, viz. a common flat button with a shank, and a small hemisphere fixed on in front. These hemispheres are punched out by the fly-press, and then the inside is turned in a chuck lathe, to receive the edge of the plain button, made as before described. When put in its place, the edge of the cup is burnished down over it to hold it fast. These buttons are afterwards gilt and burnished in the same manner as plain ones. Buttons with a hoop or projecting ring round their edge, are done in the same manner.

_Button shanks_ are made from brass or iron wire, Button bent and cut by the following means: The wire is lapped spirally round a piece of steel bar A, Fig. 8, the section of which is shown at a. The steel is turned round by screwing it into the end of the spindle of a lathe, and the wire by this means lapped close round it, till it is covered from one end to the other. The coil of wire B, thus formed, is slipped off, and a wire-fork C put into it. It is now laid upon an anvil, and by a punch the coil of wire is struck down between the two branches of the fork C, so as to be in the state of D. The punch has an edge which marks the middle d, and the coil being cut open by a pair of shears along this mark, divides each turn of the coil into two perfect button shanks. This method is so simple and expeditious, that an improvement can scarcely be conceived; but an ingenious mechanic at Birmingham, has lately invented a most curious machine to supersede this part of the labour. This machine, by the simple operation of turning a winch, supplies itself with wire from a reel, and delivers it cut and bent to the proper figure of the shank. Each turn of the winch forms a shank, and the motion is so easy that a boy can drive one machine. The inventor has a very small steam engine, which works several machines in the same room, producing shanks in immense quantities, at an inconsiderable expense in addition to the value of the metal. To attempt any description of this ingenious but complicated little machine, would be inefficient, without numerous figures; and to give such drawings, would be altogether impossible in a work so limited as ours. See Encyclopedia Methodica, Art. Boutonnier, for an account of the French method of making button moulds. An account of Clay's patent buttons will be found in the Repertory of Arts, vol. xii. p. 241; and an account of Barnett's patent buttons, in the same work, vol. xiii. p. 368.

BUXBAUMIA, a genus of plants of the class Cryptogamia, and order Musci. See Cryptogamia.

BUXTON, a village in Derbyshire, much celebrated for its mineral waters, lies in a barren valley, surrounded with bleak and uncultivated mountains, about thirty-two miles north of Derby. In describing the approach to this place, a modern writer remarks:

"All before us appeared the most forlorn nakedness; and had we not observed some marks of human industry in the stone divisions of the fields, we should have conceived that the country round was one wide extent of hopeless sterility." The handsome appearance of the town, however, and the comfortable accommodation of its inns, in some measure repay its visitors for the dreariness of its vicinity. A magnificent range of buildings, in the form of a crescent, has been erected within the last thirty years by the
BUXTON

Duke of Devonshire, solely for the reception of the company who resort every season to the wells. It contains three elegant hotels, and some private lodging houses; and in the front is a beautiful colonnade, which is seven feet wide within the pillars, and eleven feet high. This edifice was designed and executed under the direction of Mr Carr; and, together with the offices behind, which are likewise remarkably elegant, is said to have cost nearly £120,000. It displays no affected ornament, but is finished in a style of elegant simplicity. Besides the crescent, there is another building called the Hall, which was erected in the 16th century by the Earl of Shrewsbury, for the accommodation of visitants, but which was rebuilt and enlarged in 1670 by the Earl of Devonshire. It contains the baths, and is also one of the principal hotels for the reception of company. The baths are five in number; the gentleman’s bath, the ladies bath, one for the poor, and two private baths. The water is generally drank at St Ann’s well, an elegant little building in the antique style, opposite to the crescent, where it is conveyed from the original spring into a white marble basin. This well is regarded as one of the seven wonders of the Peak, from the circumstance that hot and cold spring water may be obtained within twelve inches of each other.

Buxton has a small manufacture of cotton, but its chief support arises from the visits of strangers, who are annually attracted by the benefit of its waters, or the curiosities of the adjacent country. During the bathing season, which commences in June, and generally concludes in October, the amusements of Buxton consist in assemblies and plays, of which there are three every week; and for the diversion of gentlemen, a pack of harriers are kept by subscription.

The warm springs of Buxton were known to the Romans, as appears from several ancient roads concentrating at this spot, and also from the remains of an ancient bath, which was discovered here in 1781, and other specimens of Roman architecture; and they are supposed by Dr Gale to be the Aquis of Ravennas. They seem, however, to have been entirely deserted during the middle ages; and it was not until the sixteenth century that they were again brought into notice, by Dr Jones, who in 1572 published a treatise on their beneficial qualities, entitled, “The Benefit of the Ancient Bathes of Buctonæs, which cureth most grievous Sickness.” Since that time their celebrity has continued to increase, and they have been found very beneficial in various diseases, particularly in gout, rheumatism, naphritic and bilious disorders, and debility of the stomach and intestines. The springs yield a most plentiful supply of water, and have been calculated to throw up about sixty gallons in a minute. The water is used both externally and internally by invalids, and is also employed in the principal hotels for making tea, and other common purposes. When drank, however, in considerable quantities, it is apt to occasion feverish symptoms, and is found to possess a blinding and heating quality. Dr Denman recommends it to be taken in moderate portions; and observes, that, “in common, two glasses, each of the size of the third part of a pint, are as much as ought to be drank before breakfast, at the distance of forty minutes between each; and one or two of the same glasses between breakfast and dinner will be quite sufficient.” In the baths, the water rises through the crevices of the floor, and its temperature is almost invariably at 92° of Fahrenheit’s thermometer; but that which is drank at the well loses about three-fourths of a degree in its passage from the spring to the marble basin. This water is perfectly colourless, and without either taste or smell; and, except its temperature, has scarcely any quality to distinguish it from the purest common springs. According to Dr Pearson’s analysis, a gallon of it, when evaporated, deposited 16 grains of sediment, of which 11 were calcareous earth, 21 vitriolic selenite, and nearly 2 sea salt; and the same gentleman was the first who ascertained the nature of the air-bubbles which constantly rise with the water and break at the surface, and which he found to consist almost entirely of azotic gas, with a small portion of atmospheric air.

In the neighbourhood of Buxton are immense quantities of lime-stone, of which many hundred tons are annually burnt; and it is worthy of notice, that the habitations of the workmen are scooped out of the small mounts formed of the refuse of the kilns, and appear like a range of caves along the side of the hill. Some of these habitations contain two or three rooms, but few of them have any other light than what they receive by the door and the chimney. “When the workmen,” says a modern traveller, “descend into their caves at the time of repast, and a stranger sees the many small columns of smoke issuing out of the earth, he imagines himself in the midst of a village in Lapland.”

The village of Buxton contains 180 houses, and 760 inhabitants; and its annual visitors, including their attendants, are supposed to be about 500. See Britann’s Beauties of England and Wales, vol. iii. p. 467, and DERBYSHIRE. (L)

BUXUS, a genus of plants of the class Monocicis, and order Tetrandria. See BOTANY, p. 323.

BYE-LAWS, are those orders or private statutes of boroughs and other towns, fraternities of trade, guilds, &c. which regulate their members and common interests. The private regulations of courts-leet and courts-baron in England, are likewise so denominated by some writers; but we can see no reason why the application should stop there, since, in the nature of the thing, it is equally applicable to the private regulations of all courts whatever, even of the highest jurisdiction, and yet the regulations of these courts are not commonly so classed or denominated. The laws of burthen, still known in some districts of Scotland, seem not improperly to be considered as bye-laws, and therefore ranked under the same appellation. They are described by Skenes, though with some obscurity, (vide Burthen,) as rules made for the government of a particular neighbourhood, by certain individuals who are chosen for that

purpose, by common consent, in the courts called the byelaw courts. The word, he adds, is from the Dutch bylou, or boursman, i.e. rustious; so that byelaws are leges rusticorum.

To be obligatory, byelaws must, of course, be consistent with the charter or other fundamental principles of the corporation or other body over which they are meant to have effect; they must derogate nothing from the established usages of such particular community; be framed with an impartial regard to the common interest; and be strictly conformable to the public or municipal law of the county. Blackst. Comm. Tomlins. Jacob's Law Dict. (s. b.)

BYNG. See Britain, Index.

BYRON, the Hon. John, an admiral in the British service, is chiefly known as the author of a "Narrative of the Shipwreck of the Wager on a desolate Island on the coast of Patagonia," and as being the principal actor in that disastrous occasion. He was the second son of William, fourth Lord Byron, and was born on the 8th of Nov. 1723. Having entered the navy at a very early age, he was appointed a midshipman when only eight years old, in 1731, before which time, however, he had made several voyages in a merchantman. In the expedition which was dispatched against the Spanish settlements in South America, under Commodore Anson, and which sailed from Portsmouth on the 18th of September 1740, Mr. Byron was a lieutenant on board the Wager. The result of this expedition is sufficiently known, from the classical account of it which was given to the world under the direction of its commander. After doubling Cape Horn, with considerable difficulty, the Wager became so disabled in her rigging, that she was unable to keep company, and was at last completely separated from her consorts in the Pacific Ocean. During a violent storm which ensued, the crew were exposed to all the apprehensions arising from the dangers of a lee shore, and as all endeavours to wear the ship off the land had proved fruitless, every ray of hope was extinguished in the awful night which succeeded. It came on dreadful beyond description, and early in the morning the ship struck. "In this dreadful situation," says Mr. Byron, "she lay for some little time, every soul on board looking upon the present minute as his last, for there was nothing to be seen but breakers all around us." From this perilous extremity, however, they were relieved by a mountainous sea which hove the ship off; and soon after she most providentially stuck fast between two rocks, when the day breaking, and the weather clearing up, the crew got safely on shore. This miraculous deliverance from immediate destruction, though in such circumstances a most desirable event, and the highest object of their wishes, was to many of them only a prolongation of misery. "Whichever way we looked," observes our author, "a scene of horror presented itself; on one side the wreck, (in which was all that we had in the world to support and subsist us,) together with a boisterous sea, presented us with a most dreary pros-

pect; on the other, the land did not wear a much more favourable appearance: desolate and barren, without sign of culture, we could hope to receive little other benefit from it than the preservation it afforded us from the sea." But for the consequent sufferings, and interesting adventures of Mr. Byron, during nearly five years, we must refer to his "Narrative;" we cannot, however, refrain from presenting to our readers the sum of them in the beautiful lines of Mr. Campbell in his address to Hope:

"Friend of the brave! in peril's darkest hour,
Intrepid virtue looks to thee for power;
To thee the heart its trembling homage yields,
On stormy floods, and carnival covered fields.

—such thy strength-inspiring aid that bore
The hardy Byron to his native shore—
In horrid climes, where Chiloë's tempests sweep
Tumultuous murmurs o'er the troubled deep,
"Wert thou to mourn misfortune's rudest shock,
Scour'd by the winds, and cradled on the rock:
To wake each joyless morn, and search again
The famished haunts of solitary men,
Whose race unyielding as their native storm,
Knows not a trace of nature but the form;
Yet at thy call, the hardy tar pursued,
Pale, but intrepid; sad, but unsubdued;
Fierc'd the deep woods; and, hailing from afar
The moon's pale planet, and the northern star,
Pased at each dreary cry, unheard before,
Hyenas in the wild, and mermaids on the shore;
Till, led by thee o'er many a cliff sublime,
He found a warmer world, a milder clime,
A home to rest, a shelter to defend,
Peace and repose, a Briton and a friend." +

Pleasures of Hope.

On his return to England in 1746, Mr. Byron was appointed to the Syren frigate, which he continued to command during the remainder of the war. Ill fortune, however, seemed still to attend him. Every cruise was unfruitful. "His courage and conduct were undoubtedly," says his biographer, "but he was ever a day too soon or a day too late;—or he sprung a mast in chace, or lost his prize in a fog; or fell in with a wane of wind, which his enemy had passed, or some disaster or other." So invariable, indeed, was his ill luck, and so frequent his misadventures, that he was emphatically called, by his nautical brethren, "Foulweather Jack."

At the peace in 1750, Captain Byron went with Commodore Buckley to the coast of Guinea; and in 1757 he commanded the America of 60 guns, in the luckless expedition against Rochfort, under Sir Edward Hawke. In 1760, however, when stationed off the coast of America with the British fleet under Lord Colville, his fortune began to brighten, and he here found an opportunity of being of some service to his country. The Admiral, having received intelligence that a French squadron, with troops and stores on board, had put into Chaleur Bay, in the Gulf of St. Lawrence, dispatched Captain Byron in quest of them, with the fame a 74 which he then commanded, together with the Repulse and Scarborough. After experiencing some difficulty in approaching them,

† This friend was Don Patricio Geddes, a Scotch physician, resident at St. Jago, the capital of Chili. See the "Narrative." page 161.
Byron.

BYZANTZIUM, an ancient city of Thrace, situated on the Bosphorus, N. Lat. 41°, E. Long. 29°. It stood on a promontory of a nearly triangular form, commanding, to the right, a view of the Propontis, or sea of Marmora; and in front, the narrow channel of the Bosphorus, with the cities of Chalcedon and Chrysopolis, on the Asiatic coast; and to the left, fertile eminences, and a gulf, which retaining inland not less than six English miles, served for a most commodious harbour. The river Lycus, formed by the conflux of two small streams, fell into it, and this harbour was altogether so excellent, that it is at this day, according to some, called the Porte by way of eminence; and was universally considered as combining more of the advantages of strength, convenience, and beauty, than any other harbour in the world. So much was this the case, that the inhabitants of Chalcedon, on the Asiatic side of the strait, were denominated by the oracle the blind, cacei, (Tacit. An. b. xii. c. 63.) because their founders had, a short time before the building of Byzantium, (when they had their choice of the two sides,) been so stupid or blind as to prefer the Asiatic. The harbour, at its mouth, was only about 500 yards broad, but in most other places a mile, and capable of floating vessels of any size.

Byzantium occupied the place where the capital of the eastern empire afterwards stood, and where the capital of the Turkish empire now stands. About seven miles to the north of the city, viz. at the place where stood the celebrated temple of Mercury, and where Darius connected the two continents by a bridge of boats, the channel of the Bosphorus was so narrow, that two persons, placed the one in Europe and the other in Asia, could easily make themselves heard by one another. The citadel stood on the point of the promontory. The walls of the city were built of huge square stones, so skilfully joined for the inestimable qualities of his heart, and his kindness and humanity to those whom he commanded. See Ballantyne's edition of Byron's Narrative, containing a well written life of the author, to which we have been indebted for the principal facts in this article. (p)

BYSSUS, a genus of plants of the class Cryptogamia, and order Alga. See Cryptogamia.

BYSSUS, or Byssusum, the name of a fibrous substance produced in Egypt, India, Judea, and at Elba, and employed by the ancients in the formation of fine garments.

Some writers suppose that the byssus of the ancients was the silken threads of the pinna marinæ. Bochart imagines that it was a kind of fine flax, while others consider it to be a cotton, or a mixture of linen and cotton. See Foster de Byssus Antiquorum, Lond. 1776; Osbeck's Voyage to China, vol. i. p. 383; and Mem. Acad. Par. 1715, p. 204. See also Cotton. (w)

BYSTROPOGON, a genus of plants of the class Didymania, and order Gymnosperma. See Botany, p. 242.

† Others, however, give a different account. "The offices of all the Viziers are in the same court or division of the palace; the entrance of which is through a lofty gate-way, called the Babi Hurnayon (imperial gate), translated by Europeans the Sublime Porte." Mirza Abu Taleb's Travels, vol. ii. p. 241.
BYZANTIUM.

Byzantium, as to have only the appearance of a single block, and
they were much loftier on the land side than towards
the water, where the waves and projecting rocks
formed a natural defence. They were strengthened
by numerous towers, seven of which are said to have
been so artfully constructed, that the least noise made
in any one of them was immediately communicated
to all the rest. Ancient authors inform us, that, in
the fourth century before the Christian era, this city
had a gymnasia, as well as many other public build-

ings, and possessed almost every convenience and
luxury which we usually find among a rich, num-
rous, and active people. Xenophon says, they had a
forum spacious enough to contain a small army
drawn up in order of battle, and in this forum, De-
mosthenes says, the people used to assemble to con-
firm or reject the decrees of their senate.

A considerable territory belonged to Byzantium,
which was abundantly productive of grain and fruits.
Aristeaus, Pliny, and Tacitus, inform us, that im-
mense quantities of fish, (though of what kind they
do not say,) were wont to be caught in the harbour.
Vis piscium innumera, says the latter, Ponto erumpere,
et obliquis subter undas saxis exterrita, omisso alteri-
us littoris fleus, hos ad portus defertur.† Spring
and autumn were the principal seasons for taking
these fish. In spring they were proceeding north-
ward into the colder regions of the Euxine Sea, and
in autumn returning southward into the Medi-
terranean. This fishery, according to Aristaeus, brought
a large revenue to the city, which likewise enjoyed
an active and flourishing commerce. The excellence
of its harbour, sheltered on every side from storms,
attracted thither numerous vessels from all the nations
of Greece; and its situation at the mouth of the
strait enabled it to subject to heavy duties, or to
stop altogether, those merchants of more southern
states who carried on a trade with the Euxine.

Hence the importance attached to the friendship
of this city by the Athenians and Lacedaemonians, and
their constant endeavours to engage it in their
interests.

It was founded, according to Eusebius, about the
30th Olympiad, that is, 656 years before the birth
of Christ, during the reign of the Roman king Tul-

lus Hostilius; but, according to Diodorus Siculus,
the foundations of Byzantium were laid as far back
as the Argonautic expedition, 1250 years before the
Christian era. The founder, he says, was one By-
zas, a king of the neighbouring country, from whom
Byzantium derived its name. Eustathius says, that
this Byzas came into Greece, and settled there with
a colony of Megarceans, a short time before the Ar-

gonauts arrived in those seas. Velleius Paterculus
supposes Byzantium to have been founded by the
Milesians, and Ammianus Marcellinus ascribes it to
the Atticans. Vetus Byzantium Atticorum colonia,
says he. Probably the Milesians were a colony of
Atticans; and if so, Velleius and Ammianus are per-
fectly reconciled. But it is probable that these last
mentioned people only rebuilt or repaired Byzantium,
after it had been destroyed or had fallen into decay.

Medals of ancient Byzantium have reached our times,
bearing the name and head of Byzas, with the prow
of a ship on the reverse.

Justin says, that Pausanias the Spartan first built
Byzantium, but in this he must have been mistaken
for we learn from Thucydides and Herodotus, that
Pausanias, about the year B.C. 476, took it from
the Persians, who had made themselves masters of it,
before he had been in that quarter. Pausanias prob-
ably rebuilt and improved Byzantium while he con-
tinued to possess it, and while he there carried on his
treachery correspondence with the Persians.

The city underwent many revolutions, and fre-
cently changed masters, having been sometimes in
the possession of the Persians, sometimes of the La-
cedemonians, and also of the Athenians, who took it
about the year B.C. 407. In the year B.C. 339,
it was attacked by Philip of Macedon, who, after
a tedious siege, was compelled by Phocion, the
Athenian general, to relinquish his object and re-
trat.

The whole of Greece, together with Lycia, Rhodes,
Samos, Cilicia, Thrace, and Byzantium, after many
victories, was, in A.D. 71, reduced to the state of
Roman provinces by Vespasian.

The siege of Byzantium, by Severus, which
commenced A.D. 194, and continued for three years,
was, both for the obstinacy of the defence, and the
cruelty exercised by the conquerors after its capture,
one of the most extraordinary recorded in history.

Having taken part with Niger, in the contest be-
twixt him and Severus, the latter invested it in due
form. But though, during the siege, the bloody
battle of Issus was fought, which terminated in the
defeat and death of Niger, and though his head, when
sent to Byzantium, was exhibited to the besieged on
the point of a spear, yet the city still held out.

In addition to the natural advantages and strength
of the place, the Byzantines had, both before and du-
ring the siege, provided themselves with warlike ma-
achines of various sorts; some of which hurled against
the besiegers when they approached the walls, large
beams and stones, whilst others showered upon them
darts and smaller stones to a greater distance. Strong
iron hooks fastened to chains were let down from the
wall, and dragged up whatever they laid hold of.

One Perius, a famous Bithynian engineer, is said
to have been the constructor of these machines; and
was more fortunate after the capture of the city than
the celebrated Archimedes of Syracuse; for his life
was spared by Severus, who hoped to profit by his
talents. The entrance of the harbour was barred by
a strong chain, and its piers on each side were forti-
fied by towers. It contained 5000 small vessels, of
which the greater part had pointed iron prow; and
some of them were constructed with a rudder at each
end, and had a double complement of men to work
them, so that without turning, and at a moment's
warning, they could advance or retire as occasion re-
quired. When the besieged lost any of their ships,
they built others of the timber of their houses, and
the women cut off their hair to supply materials for

† "The only article in which the markets of Constantinople excel those of other cities is fish; of those they have a great
variety, some of which are very delicious." Travels of Mirza Abu Taib Khan, vol. ii. p. 226.
Famine became so urgent, that they were at length reduced to the necessity of using the most loathsome substances for food, and even human flesh itself. At last, while in this miserable situation, some of the most daring and vigorous took advantage of a storm that arose, to embark on board their ships and bring a supply of food for their fellow citizens, or perish in the attempt. They were, however, attacked by the besiegers on their return, and so completely destroyed that not a single ship escaped. Deprived of their last hope, the Byzantines were compelled to surrender; and the mind contemplates with horror and disgust a people, after a defence so brave and protracted, deprived of their estates and sold for slaves,—their magistrates, commanders, and soldiers, indiscriminately massacred, and the walls of their city levelled with the ground; yet such was the treatment they received from their ungenerous conquerors. Dion Cassius says, he saw their city after its capture “in such a state of ruin, that it might have been thought to have been taken by the barbarians, rather than the Romans.” Not long, however, after this terrible catastrophe, Severus himself caused a part of the city to be rebuilt, and changed its name to Antonina, in compliment to his son Caracalla, whose proper name was Antoninus. But he did not restore the privileges of a free city, nor reverse the decree by which it had been subjected by him to the dominion of its neighbours, the Perinthians.

In 262, for reasons which have not been very well ascertained, the tyrant Gallienus had determined to wreak his fury on the Byzantines. Despairing of being able to take so strong a place by force, he made the most solemn assurances to the inhabitants, that if they would admit him into their city, all persons and their property should be sacredly respected. But he violated these assurances, and was no sooner admitted than he ordered a general massacre, not only of the garrison, but of the inhabitants at large; and, according to Trebellius Pollio, not an ancient family of Byzantium was left in existence, except a very few, whose members happened at the time to be abroad in the armies or on business.

In the wars betwixt the two emperors Maximin and Licinius, the first besieged and took Byzantium, but was in a short time after compelled to give it up to his rival; who, in his turn, was under the necessity of abandoning it to Constantine the Great, to whom it opened its gates in 321.

Constantine was so strongly impressed with the superior advantages of Byzantium as a place of residence, that he resolved to make it for the future the capital of his empire. Accordingly he began next year to repair, enlarge, and beautify it. Anxious that his successors should follow his example, in making this new city the place of their ordinary residence, he spared neither cost nor pains to render it worthy of their preference. Magnificence, convenience, and beauty, were studied in all its public and private edifices, and in a short time Byzantium was almost to rival the ancient capital of the empire. “He urged the progress of the work,” says Gibbon, “with the impatience of a lover; the walls, the por- ticoes, and the principal edifices, were completed in a few years.” The encouragement given to settlers in the new city, and particularly an edict published by the emperor, declaring that such as had lands in Thrace, Pontus, or Asia, should not be at liberty to dispose of these, or even leave them to their proper heirs at their death, unless they had a house in the city of Byzantium, soon rendered it one of the most populous and flourishing of the empire. An amphitheatre, a circus maximus, several forums, porticoes, and public baths, with whatever else could contribute to the dignity of a great capital, and to the benefit or pleasure of its numerous inhabitants, were soon found in Byzantium. The city was divided into 14 regions, and privileges and immunities granted to the inhabitants, equal to those that were enjoyed in Rome. The common people, even from that ancient capital, as well as from all other parts of the empire, were invited, by the emperor’s donations of corn, wine, and oil, to come and settle at Byzantium. Christians, however, had a manifest preference shown them. The statues of the heathen deities were everywhere demolished, and their temples converted into churches, and consecrated to the worship of the true God. Crosses were erected in all the squares and public places.

In the 25th year of his reign, (May 11th, 330,) Constantine, if we believe Cedrenus, caused the city to be solemnly dedicated to the Virgin Mary; but Eusebius says, it was consecrated to the God of Martyrs. On this occasion it was dignified with the new name of Constantinopolis, the city of Constantine, its great benefactor; and, what was still more flattering, with the name also of Second or New Rome, being declared to be the metropolis of the East, as Old Rome was of the West. The emperor established a senate and other magistrates, at Constantinople, equal in power and authority to those of Rome, nor did he ever after return to that ancient capital. The removal of the imperial seat to Byzantium, is commonly stated to have taken place in the 25th year of the reign of Constantine, A. D. 330, and A. U. C. 1128. See Stephan. in loco. Velleius Pater. Euseb. Chron. Anc. Un. Hist. vol. xiii. and xiv. Barbieramy Voyage de jeune Anachar. Gibbon’s Rom. Empire, vol. iii. (2)
C. **See Alphabet and Character.**

C, in music, has been applied, since the time of Guido, to mark different notes in the scale, at the distance of an octave from each other, viz. C-fa-ut, on the second space of the bass stave; C-sol-fa-ut, on the ledger line above the bass stave, or the same below the treble stave or the tenor; or C, cliff-line wherever placed, the third space in the treble, &c. This note is the nominal, or key of one of the natural modes, bearing a sharp or major third, and, in that capacity, was denominated *ul* by Guido, and has since been called *do* by the Italians. In modern times, since the temperament of the musical scale has been attended to, it has been usual to consider C as the key note; and usually, the octave above the tenor cliff C, mentioned above, has been used as the bass or fundamental note, and its pitch, or degree of acuteness, has been regulated and preserved by steel instruments, called tuning-forks, or C-forks, used by the tuners of finger-keyed instruments; but violin performers use an A-fork for tuning their instruments, because they have no string to the note C; and some few persons, as Mr. Broadwood, use the A-fork for piano-fortes. The pitch, or degree of tone, of the tenor cliff C, in our best concerts, is now such, as to make, or excite in the air, 240 complete vibrations in one second of time, (see Concert Pitch,) and the C below this, half as many, or 120; the C above it, 480; and that next higher still, 960 vibrations, &c.

**CAABA,** a stone edifice in the temple of Mecca, which has been revered with superior sanctity by the Arabsians, from the remotest antiquity; and to which every Mahometan is required by the Koran to direct himself in prayer.

Among the variety of fabulous traditions which have been propagated by the followers of Mahomet, concerning the origin of this building, we find it asserted, that its existence is coeval with our first parents, and that it was built by Adam, after his expulsion from Paradise, from a representation of the celestial temple, which the Almighty let down from heaven in curtains of light, and placed in Mecca, perpendicular under the original. To this the patriarch was commanded to turn his face when he prayed, and to compass it by way of devotion, as the angels did the heavenly one. After the destruction of this temple by the deluge, it was rebuilt by Abraham and his son Ishmael on the same spot, and after the same model, according to directions which they received by revelation; and since that time, it has continued to be the object of veneration to Ishmael's descendants. Whatever discredit we may give to these, and other ravings of the Moslem impostor concerning the Caaba, its high antiquity cannot be disputed; and the most probable account is, that it was built and used for religious purposes, by some of the early patriarchs; and after the introduction of idols, it came to be appropriated to the reception of the Pagan divinities. *Diodorus Siculus,* in his description of the coast of the Red Sea, mentions this temple as being, in his time, held in great veneration by all the Arabians; and *Pococke* informs us, that the linen or silken veil, with which it is covered, was first offered by a pious king of the Hamyartes, seven hundred years before the time of Mahomet. It had been frequently repaired, and was rebuilt a few years after the birth of this prophet, by the tribe of Koreish, who had acquired the possession of it either by fraud or violence from the Khazaites. The Caaba then contained three hundred and sixty images of men, lions, eagles, &c. the objects of idolatrous worship, which were all destroyed by Mahomet, after the taking of Mecca, when it was purified and adorned, and consecrated to the service of Islam. It received several reparations after his death, and was rebuilt by one of his successors, with some alterations, in the form in which it now stands.

As no European is permitted to visit Mecca, the only knowledge we have of the present appearance of the Caaba, is derived from the descriptions and draughts of the Mahometans, who indeed speak of it in terms of high admiration. It would appear, however, even from their designs, that it is an awkward and shapeless building. It consists of a sort of square tower, 24 cubits by 23, and 27 high, covered on the top with rich black damask, bordered with an embroidery of gold, which was formerly renewed every year by the Mahometan Caliphs, afterwards by the sultans of Egypt, and which is now annually provided by the Ottoman Porte. The floor is raised six feet from the ground; and a door and window admit the light. Its double roof is supported by three octagonal pillars of aloes wood, between which are suspended several silver lamps; and the gutters on the top are made of pure gold. At a small distance from this tower, on the east side, is the *station* of Abraham, where is a stone upon which the patriarch is supposed to have stood when he built the Caaba, and which, they pretend, still bears the traces of his footsteps. It is inclosed in an iron chest; and here the sect of Al Shafei meet for religious purposes. On the north of the Caaba is the *white stone* within a semicircular enclosure, 50 cubits long, which is said to be the sepulchre of Ishmael, and which receives the rain-water that falls from the Caaba by a golden spout. This

† Specimen, p. 60, c1.
stone is of considerable antiquity, and was even held in great veneration by the Pagan Arabs. Towards the south-east is the well Zem-zem, remarkable for the excellence and medicinal quality of its waters, as well as for its miraculous origin. It is affirmed to be the same spring which, miraculously bursting out of the ground, supplied Ishmael and his mother Hagar, when overcome with thirst in the wilderness of Beer-sheba; and is celebrated by the Mahometans, not only for curing many bodily diseases, but also, if taken copiously, for healing all spiritual disorders, and procuring an absolute remission of sins. The well is protected by a dome or cupola, and its water is drank with much devotion by the pilgrims, and conveyed in bottles to the most distant quarters of the Mahometan dominions. But the most singular relic, and which is regarded with extreme veneration, is the famous black stone, which the Mahometans pretend was one of the precious stones of Paradise, and was brought down from heaven by the angel Gabriel. According to the received tradition, derived from Mahomet himself, it was originally of such a bright white colour as to dazzle the eyes at the distance of four days journey, but that it wept so long and so abundantly for the sins of mankind, that it became at length opaque, and at last absolutely black. When the Carmathians took Mecca, they pillaged the Caaba, and carried off the black stone in triumph to their capital. The Meccans made every effort to recover it, both by entreaties and the offer of 5000 pieces of gold, but without effect. The Carmathians, however, after having kept it 22 years, sent it back of their own accord. It is now set in silver, and fixed in the south-east corner of the Caaba, looking towards Bara, about 34 feet from the ground. It is called by the Mahometans "the right hand of God," and is kissed by the pilgrims with great devotion.

The Caaba is almost surrounded with a circular inclosure of pillars, connected at the top by bars of silver, and towards the bottom by a low balustrade. Without this enclosure, on the south, north, and west, are three oratories, where three of the Mahometan sects assemble to perform their devotions. The whole is enclosed at a considerable distance by a square colonnade, or great piazza, covered with small cupolas, and consisting of 448 pillars, from which hang numerous lamps, and 38 gates; and from each corner rises a minaret or steeple, adorned with a gilded spire and crescent. This enclosure was built by the caliph Omar, to prevent the court of the Caaba from being encroached upon by private buildings. It was at first merely a low wall, but has since been raised by the liberality of succeeding princes to its present magnificent state. The whole structure of the Caaba is in a peculiar manner styled Al Masjid Al Haram, "the sacred or inviolable place;" which appellation, however, is sometimes extended to the whole territory of Mecca.

According to the command of Mahomet, every Mussulman must, once in his life, visit the Caaba, and perform the customary acts of devotion in the sacred places. But could the prophet have foreseen into what distant regions his religion was to be introduced by the arms of his followers, he would soon have perceived the absurdity of such an injunction. Few, in comparison with the immense numbers who have embraced the doctrines of Islam, can be supposed able to discharge this duty; and we may presume, that it is only such as are more than ordinarily devout that are ever induced to visit the Caaba from religious motives. Many pilgrims, however, annually resort to the city of Mecca, but commercial ideas mingle with those of devotion; and the arcades of the temple are often filled with the richest merchandise from every quarter of the world. This duty may be discharged by proxy, but the pilgrim, in this character, can act only for one person at one time; and to prevent all imposture, he must carry back with him a certificate from the Imam of Mecca, of his having actually performed all the devotional exercises or ceremonies appointed by the law, in the name of his principal. These ceremonies consist chiefly in performing seven circuits round the Caaba, and kissing the black stone; in running seven times between the mountains of Safa and Al Merwa; in making the station on Mount Arafat; in sacrificing the victims in the valley of Mina; and in burying their hair and nails in the consecrated ground. The same ceremonies were observed by the Pagan Arabs many years before the appearance of Mahomet, but they were confirmed by the command of the prophet, with this alteration, that his followers should be clothed when they compassed the Caaba, whereas, their ancestors performed their devotions naked. See Arabia, vol. ii. p. 273.; see also Niebuhr's Travels through Arabia, vol. ii. p. 26.; Gibbon's Rome, vol. ix. p. 216., 12mo.; Med. Un. Hist. vol. i. p. 207.; Reland de Religione Mahometica, p. 113.; and Sale's Koran, p. 114. (p.)

CABAL MINISTRY. See BRITAIN, p. 601.

CABALLERIA, a genus of plants of the class Polygymnia, and order Diccia. See BOTANY, p. 347.

CABBALA, among the Jews, means those oral traditions respecting the interpretation of the law, which they pretend were originally communicated by revelation, and handed down from father to son, without interruption, alteration, or omission. By means of this mystical science, they pretended to be able to explain all the appearances of nature, as well as the revealed and written law of God. It appears, indeed, that the Jews preferred the caballistical traditions to the acknowledged scriptures, whose meaning they had almost entirely subverted. It was not without reason that our Lord charged the Jews with having made the law of God of no effect by their traditions; and he specifies several instances which already substantiate the charge.

Maimonides, in the preface to the Mishnah, gives the following account of the origin of the Cabbala. It was revealed to Adam by an angel, who brought him a book containing the mysteries of this recondite science. This book was lost at the fall, and restored again in consequence of the earnest prayers of Adam; and being again lost amidst the corruption which preceded the flood, it was afterwards restored to Abraham. But a particular revelation was given on this subject to Moses, on Mount Sinai, who received a mystical and traditionary, as well as a written and perceptive law. This traditionary law was
C A B

CAB

Prideaux's, containing the complete explanation of that which was written; and as the meaning is always more valuable than the mere symbol, so this pretended explanation of the law by divine authority, was soon exalted above the law itself. We are farther told, that Moses, on coming down from the mount, rehearsed both the law and the explanation of it to Aaron; then to his sons Eleazar and Ithamar; then to the seventy elders; and, last of all, to the whole people: so that Aaron heard it four times, his sons thrice, the elders twice, and the people once. The law only was committed to writing; the explanation was entrusted to the memories of the priests and elders. The first was simply called the law, the second the oral law, or cabbala, derived from the Hebrew kibeh, to receive by tradition. The Jews farther pretend, that the cabbala being again lost during the Babylonian captivity, was restored to Esdras, and they mention several famous rabbis by whom it was restored to later ages.

It cannot be necessary to attempt a serious refutation of these notions, which are not only totally unsupported by scripture, but contrary to some of its clearest intimations. They betray an evident design to wrest the word of God from the people, and to introduce something resembling the esoteric doctrines of the heathen: they are in short a part of that system of priestcraft, which has often exerted such a malignant influence over the knowledge and happiness of men.

Some Christian divines have held opinions bearing a considerable resemblance to the cabbala of the Jews. Thus Parkhurst in his Hebrew Lexicon, p. 115, 4th edit. says, "It may safely be inferred, that the whole garden was so contrived by infinite wisdom, as to represent and inculcate on the minds of our first parents, a plan or system of religious truths, revealed to them by their Creator." This may be called a kind of natural cabbala. But the doctrine of traditions has been received in its full extent by the church of Rome, which holds them of equal value with the written word of God. According to the council of Trent, "the truth and discipline of the Catholic church, are comprehended both in the sacred books and in the traditions which have been received from the mouth of Jesus Christ or of his apostles, and which have been preserved and transmitted to us by an uninterrupted chain and succession."

But the Jewish cabbala was chiefly of that artificial kind, which drew mystical meanings from particular words or expressions, thus producing significations very different from what the words or expressions seemed naturally to imply. This artificial cabbala was of three kinds: the first, called gematria, consisted in interpreting words according to the arithmetical power of the letters which composed them. Thus, in the words שִׁלֹה Shilo, i.e. שִׁלוֹה שֶׁלֹה She'llow shall come, the numerical value of the letters is the same as in the word שִׁמְעָה Shemayah. The second kind of artificial cabbala was called notarikon, and consisted in taking every letter for a word, and thus making an entire sentence out of one word. Thus the first word in the book of Genesis נְפַשׁ בְּרֶשֶׁת Нophe Брешит, contains the initial letters of these words; Bere, Rekko, Aretz, Shemim, Im, Teumut, and may be translated, "he created the firmament, the earth, the heavens, the water, and the abyss." The third kind was called themurah, and was much the same as the modern anagram, which consists in forming new words by the transposition of letters. Thus, from the same word Bere'shith, the cabbalists formed א-בְּרֶשֶׁת, i.e. the first day of the month Tisri, and from this accidental coincidence, they inferred, that the world was created at that season of the year, corresponding nearly with our September.

These are sufficient examples of rabbinical triding, and should be a warning to divines and commentators to avoid occult and fanciful interpretations, and to abide by the plain meaning of the word of God. We do not affirm that there never is any secret meaning contained under the words of scripture: in several places of the book of Revelation, some mystery is evidently concealed under particular names and expressions; but then we are expressly warned of this, and unless when we have such intimation, it is idle to search for secret meanings; and even with regard to those names and expressions, which are confessedly mystical, we have shown the danger and uncertainty of cabbalistical interpretations. See Antichrist.

For further particulars respecting the Jewish cabbala, see Calmet's Dictionary; Prideaux's Connect; Enfield's Hist. of Philosophy, vol. ii. chap. 3. (g)

CABENDA, or CABENDA, a sea-port town of Africa in the kingdom of Cacongo, is situated at the mouth of the river Cabenda, on the round point of the bay, which is very convenient for trade, wooring, and watering. The huts are built of reeds and mud, and the natives live chiefly by fishing. See the Strange Adventures of Andrew Basset, inserted in Purchas's Collection of Voyages, &c. See also Angoy. (j)

CABÉZZO, one of the provinces of the kingdom of Angola, lying between the rivers Coanza and Rimba. The country, which is well peopled, abounds with cattle and provisions of different kinds. The Portuguese obtain great quantities of iron from the iron mountains in its neighbourhood. (j)

CABIRI, in mythology, the name given to certain deities, worshipped with great solemnity in Lemos, Thebes, and other parts of Greece; but particularly in Samothrace, which was specially consecrated to their service. The word, according to Varro and Macrobius, signifies great and powerful deities, and is probably derived from the Hebrew wordgeber, "to be strong." The names of the Cabirian deities, according to Mmeas, as cited by the scholiast of Apollonius Rhodius, were Азеврос, or Ceres; Акюерса, or Proserpine; Акюериусра, or Pluto, and Ακμулл, the same with the infernal Mercury.

The Cabirian worship is involved in the greatest mystery and obscurity. Captain Wilford has thrown some light on the subject, which, though it does not remove the difficulties, is useful, in so far as it shows the connection between the mythology of the east and that of the western world.

In the Adhuita-cosa we find the following legends, which have an obvious relation to the deities worshipped in the mysteries of Samothrace. In Patala (or the infernal regions) resides the sovereign queen of the Naga's (or large snakes); she is beautiful, and her name is Αγορα. The servant of Dharma-Ra-
ja, or king of justice, is Cashmala, who drags the wicked with ropes about their necks, and throws them into hell.

Axioceras, the name of one of the Cabirian gods, is obviously derived from *Asyoreus*, or rather from *Asyors*, or *Asyors*, which signifies literally, *she whose face is most beautiful*.

Axioceras is derived from *Aystoercas*, a word of the same import with the former, and it was the sacred name of Proserpine. The word Proserpine is obviously derived from the Sanscrit *Prarakarpanti*, or she who is surrounded by large snakes. Nonnus represents her as surrounded by two enormous snakes, which constantly watched over her. Her consort is Vishnu, who, according to the *Puranas*, rules in the west, and during the greatest part of the night. In this sense, Vishnu is the Div of the western mythologists, the black Jupiter of Statius; for Vishnu is represented as of a black or dark azure complexion. The titles of Vish and Ades appear to be derived from A'di or A'din, one of the names of Vishnu. When Cicero says, *Terrena autem vis omnis atque natura*, *Diti patri dedicata est*, that is, nature and the powers or energy of the earth are under the direction of Vish, this has no reference to the judge of departed souls, but belongs solely to Vishnu.

Cashmala, or Cashmala, is obviously the Casmillus of the western mythologists. The appellation of Cashmala, as a title of these gods, is unknown to the Hindoos. But the *Cuberas*, or *Cuberas*, as it is generally pronounced, are a tribe of inferior deities, whose history is given in the *Puranas*, possessed of immense riches, and who are acquainted with all places under or above ground, abounding with precious metals and gems. In this respect, their functions seem to correspond with the name of Pluto, if we suppose him to have had his name from *πνευς*, *divitae*.

There can now be no doubt, that we are to look to the East for the origin of some of the most mysterious rites of the western heathen. At the conclusion of the mysteries of Eleusis, the congregation was dismissed with these words, *Κύκλος ου Πας*; *Cox, Om, Pax*. These mysterious words were till lately considered as inexplicable: they are, however, found to be pure Sanscrit, and to be used to this day by the Brahmins, at the conclusion of religious ceremonies. They are thus written in the language of the gods, as the Hindoos call the language of their sacred books, *Canesha, Om, Pacsha*. The first signifies the object of our most ardent desires; the second is the mysterious monosyllable, used both at the beginning and conclusion of a prayer; and the third seems to indicate the termination of the religious rites. It answers to the obsolete Latin word, *vis*, a change, alternation, &c. intimating, that the course of religious observances is accomplished. See *Asiatic Researches*, vol. v.

But though we may perhaps thus trace the Cabirian worship to India, we are still as much in the dark as ever, with regard to its real origin and significance. By some the Cabiri are reckoned eight in number; and Shuckford supposes them to be the eight immediate descendants of Misram, comprehending his seven sons, and Philistin. Were we to admit this interpretation, we should then be enabled to trace the current of mythology from Egypt eastward to India. But we have, at present, no sufficient authority for such a conclusion. See Shuckford's *Connect*. vol. ii.

Others understand by them the eight persons saved in the ark, and commonly denominated the sacred ogdoad of Egypt. See Faber's *Mysteries of the Cabiri*. (g)

CABLE. See Rope-making.

CABOT, Sebastian, an eminent navigator, flourished in the beginning of the sixteenth century. His father, John Cabot, merchant and pilot, was by birth a Venetian; but, recommending himself, by his address and enterprise, to the notice of King Henry VII., he came to settle in England, under the patronage of that politic prince. Where Sebastian was born is a subject of dispute between the English and Italians; the former asserting, that he was born at Bristol about the year 1477; while the latter contend, that he was by birth, as well as extraction, a Venetian. One thing is certain, that in the oldest documents, written, it is true, by foreigners, he is constantly spoken of as born at Venice, and only brought to this country when a boy. In the report of the pope's legate, to whom Cabot had given a colloquial narrative of his voyages and discoveries, that navigator himself is made to say, that his father, on a mercantile expedition, had brought him from Venice to London when very young, 'having nevertheless some knowledge of letters of humanitie, and of the sphere.' Be this, however, as it may, young Sebastian received a thorough education suitable to his intended profession, combining at once a knowledge of mathematics and astronomy with early application to the practice of seamanship. He had already, it is said, made several voyages before the age of seventeen.

The whole world at this time resounded with the discoveries of Columbus, who returned from his first expedition in 1493. The skilful and enterprising of all descriptions, were, as is generally the case, seized with a universal frenzy for discovery, in consequence of his success; and merchants and private citizens staked the whole of their fortunes on the chance of discovering lands abounding with gold and spices. John Cabot, who seems to have been nothing inferior in abilities to his son, representing to King Henry the wealth, conquest, and glory which might accrue to England from a successful voyage of the same kind, that monarch granted letters patent, dated the eleventh year of his reign, 1495, to John Cabot, citizen of Venice, and his three sons, Lewis, Sebastian, and Sancius, for the discovery of new and unknown lands. In this deed, preserved in Hakluyt, the king gives full and free authority, leave and power, to sail to all parts, countries, and seas of the east, of the west, and of the north, under our banners and ensigns, with five ships. All the countries discovered were to be taken possession of in the king's name; but to be settled and governed by Cabot, his sons, and heirs, in quality of vassals, or lieutenants, who were to enjoy a kind of feudal authority over the population and traffic of such regions. They were subjected to the restriction of importing the mer-
Whether the Cabots sailed this year is uncertain. But we are informed, on the authority of the pope's legate, that, in 1496, Sebastian undertook a voyage of discovery with two ships. His great object, in common with most navigators of that period, was to find a passage leading to Cathay and the spices of the East; and this passage, he conjectured from his globe, might possibly exist in a north-west direction. In the beginning of summer, he accordingly set sail with his two bars, and boldly standing across the Atlantic, in a north-westerly course, trusting, like Columbus, to the guidance of his sphere and his compass, he came in sight of land much sooner than he expected or desired. Heedless of the great glory which on this occasion he acquired, of being the first navigator who saw the continent of America, he felt excessively mortified, that the passage to the Indies should thus be obstructed. Observing that the country extended towards the north, he continued his voyage in that direction, and coasting along dreary shores, which mortal eyes tell then had never surveyed, he anxiously examined the bays and inlets; but still found the land "continent." He continued this search, it is said, as far as 67° degrees; when discovering that the land turned round to the east, and finding himself surrounded by mountains of ice, in a sea where there was no night, with other circumstances of horror, he felt himself under the necessity of putting about, and retracing the whole of his fruitless course. This resolution, it is said also, was accelerated, by a mutiny of the masters and crews of his ships, who refused to proceed further in these dismal seas. It is likewise added, that on this occasion he sailed south as far as Florida, all along examining the coast in the hope of finding the desired passage. But this account cannot be true; as in that case he would have fallen in with the island of Baccalos, or Newfoundland, which he discovered afterwards; unless, indeed, we suppose the dates to be inaccurate, and that the whole of this north-west expedition took place after his discovery of that island.

The next voyage of the Cabots, for the same purpose, was in the following year 1497; when a royal licence, dated the 13th of Henry VII., was granted to John Cabot, to take six English ships, each of 200 tons and under, from any haven in the realm, and also as many of the king's subjects for mariners as might willingly accompany him. One ship was fitted out at the king's expence, and the merchants of London added three or four smaller ones. The following particulars of this voyage are taken from the great map of Sebastian, on which they were written in Latin by a hand of those times. The reader will not be displeased to have it from the black-letter translation of Hakluyt:

"In the yere of our Lord 1497, John Cabot, a Venetian, and his sonne Sebastian, (with an English fleet set out from Bristol,) discovered that land which no man before that time had attempted, on the 24 of June, about five of the clocke early in the morning. This land he called Prima Vista; that is to say, First scene, because as I suppose it was that part wherof they had the first sight from sea. That Island which lieth out before the land, he called the Island of St. John, upon the occasion as I think, because it was discovered upon the day of John the Baptist. The inhabitants of this island use to wear beasts skines, and have them in as great estimation as we have our finest garments. In their warres they use bowes, arrowes, pikes, darts, wooden clubs, and slings. The soille is barren in some places, and yieldeth little fruit, but it is full of white bears and staggars farre greater than ours. It yieldeth plenty of fish, and those very great, as scales, and those which commonly we call salmons. There are soleys also above a yard in length; but especially there is a great abundance of that kinde of fish which the savages call baccalos. In the same island also there breed hauks, but they are so very blacke that they are very like to ravens, as also their partridges, and eagles, which are in like sorte blacke."}

Three of the wretched natives of this island of Baccalos, now better known by the name of Newfoundland, were carried home by Cabot, and are described by contemporaries in terms of great wonderment. The island, called St. John's, mentioned in the above narration as lying out before the land, is supposed to have been only a projection of the main island itself.

After this period we hear no more of the elder Cabot, and indeed for twenty years little is related of Sebastian; though it is highly probable that his restless disposition, which he himself describes as "flaming with desire" to do something memorable, did not suffer him to be long on shore. In the eighth year of Henry VIII., we find him in strict coalition with Sir Thomas Pert, the vice-admiral of England, by whose interest he obtained a good ship to prosecute his constant and favourite object, the discovery of a passage to the Indies. Baffled in his attempts in the north and west, he now directed his course to the south, and sailed to the coast of Brasil. Here, however, the courage of Sir Thomas failing, Cabot was obliged to desist from his purpose; and having steered for Hispaniola and Porto Rico, where he trafficked for some time, he returned disappointed and chagrined to England. From England he soon after removed to Spain, at that time the seat of commercial and geographical information, and resided at Seville; at once perfecting himself in the knowledge of the globe, and communicating the particulars of his own observation. Here he is said to have met with great encouragement, being appointed Pilot Major, an office of great consideration, and constituted inspector of all projects of discovery, which were then frequent and successful.

In 1524, an association of Spanish merchants agreed to entrust him with an expedition to the Moluccas or Spice Islands, through the newly discovered Straits of Magellan. He accordingly sailed from Cadiz in April 1525, with four ships laden with stores and articles of commerce; and touched successively at the Canaries, Cape Verde Islands, Cape St. Augustine, and the Island of Pares, or of Guesso. At the bay of All-Saints, he was guilty, if we are accurately informed, of a most barbarous and ungrateful action.
After being liberally supplied with necessaries by the hospitable inhabitants, he seized and carried off four young men, sons of the principal people in that place. To this piece of cruelty, he soon after added another; for proceeding towards the river Plata, he landed on a desert island, and taking his admiral, Captain Francis de Rojas, and Michael de Rojas, where he left them because they had censured his conduct. His eagerness to reach the Spice Islands was once more destined to be disappointed, by a mutiny of his crews, and the want of provisions. Sailing, therefore, up the Plata about 30 leagues, he there discovered an island which he named St. Gabriel: it was about a league in circumference, and half a league from the left bank of the river; and here he dropped anchor. Three leagues higher up, his boats discovering a deep and well sheltered river, which he called St. Salvador, he removed his fleet thither, unloaded his vessels, and built a fort to keep the numerous natives in awe. Having left his fleet in this commodious harbour, and carrying along with him, in a float and small boats, several articles of traffic, he advanced thirty leagues more, when he came to another river called Zaramana. The inhabitants here were intelligent and not unfriendly; for which reason he constructed on this river also a small station, and named it Santi Espiritu, though his followers called it after himself, Cabot's fort. After discovering the river Parana, and many other rivers and islands of less note, he at last arrived at the great river Paraguay; and for the first time since his arrival on this coast, observed the inhabitants tilling the ground. Here a bloody conflict took place between his people and the Indians, of whom he made a considerable slaughter; not however without a loss on his part of 25 men killed, and three prisoners. During his excursions in those hitherto unexplored countries, Cabot was chiefly struck with two circumstances— the number and imensity of the waters, and the innumerable population on their banks.

In the course of this winter, about the beginning of 1527, James Garcia, another Spanish navigator, entered the river Plata, and without knowing that his countrymen were in that quarter of the world, came to anchor his two vessels where Cabot's ship lay. Both these commanders dispatched messengers to Spain. They whom Cabot sent to his merchants gave them a most flattering description of the river Plata, descented on the fertility and wealth of the vast regions conquered by the valour of their chief, and exhibited as a proof of his judgment and good conduct, quantities of gold and silver, and other precious commodities, all the productions of these countries. They demanded at the same time a supply of provisions, ammunition, and articles of commerce; together with reinforcements of men to retain the conquests. The merchants, however, disappointed in their golden dreams with regard to the Spice Islands, were not disposed to make additional advances in support of a scheme that promised but slow and moderate returns. They accordingly surrendered their rights to the crown of Castile. The king undertook to send the supplies, but many difficulties and delays occurring, Cabot was so tired with waiting, that, embarking his men and effects in the largest of his ships, and leaving the rest behind, he returned to Spain in 1531, after an absence of nearly six years. His failure in this expedition, and his harsh treatment of the Spanish mutineers, had procured him many enemies, so that his reception at court was not very flattering. He still, however, retained his office of pilot for many years, till at last, for some unknown reason, he was induced to quit Spain and return once more to Britain.

It is believed that Cabot resided at Bristol towards the close of the reign of Henry VIII.; about which time he is said to have been appointed Grand Pilot of England. Being introduced by the protector, Lord Somerset, to Edward VI., that young prince took great delight in his conversation, and granted him, in consideration of his services, or, according to some, as the salary attached to his office of pilot, the yearly sum of L.166: 13: 4; a sum no doubt very considerable for those times, and which Hakluyt terms "the great pension." From this period Cabot enjoyed much consideration, and in all matters of nautical enterprise was consulted as the most competent judge in England. Being made governor of the company of merchant adventurers, his eagerness for finding a short passage to the Indies returned the north-east coasts of Europe were still unexplored; and he conjectured that an opening might be found by sailing along the shores of Norway and Lapland. The king having accordingly, in 1559, granted his licence to man three vessels destined for this expedition, Cabot furnished the commanders with instructions, which are still preserved, and shew the sagacity and originality of this renowned seaman.

Two expeditions are understood to have sailed pursuant to this project; That, however, under Sir Hugh Willoughby is the only one of which we have any distinct account; and this, it is well known, though it failed in discovering a practicable passage to the east, was productive of the important discovery, that Lapland and Greenland do not meet, and that Archangel, till then approached only by land, is accessible to ships from the Atlantic. For his great trouble in maturing these important projects, the king bestowed on Cabot a donation of L.200. This great man was also made governor of the Russia company, to which situation he was appointed for life by their charter; and in 1555, Philip and Mary granted him an annuity of L.166: 13: 4. The last circumstance on record relative to the life of Cabot is, that on the 27th of April 1556, he visited Mr Burroughs, commander of a small vessel lying at Gravesend, bound for Russia, and gave him and his men a grand entertainment on the occasion. It is probable that this veteran seaman died in the following year, at the advanced age of about 80.

No navigator ever deserved more of England than Sebastian Cabot. Skill, enterprise, and a generous enthusiasm for professional distinction, were never more happily blended in the character of any mariner; and if in command he was bony and somewhat arbitrary, the complexion of his daring and rough crews rendered firmness peculiarly necessary. When on shore, he is described as uncommonly gentle in his manners, communicative, and easy of access. Ver-
CABUL, or KABUL, the capital of the Afghan empire. It lies in east Long. 68° 38', N. Lat. 34° 30'. We give the following account of this place from Foster's Travels, which describes its situation in 1783.

"Cabul, the residence of Timur Shah, and the capital of his dominions, is a walled city of about a mile and a half in circumference, and situated on the eastern side of a range of two united hills, describing generally the figure of a semicircle. The fortification, which is of a simple construction, with scarcely a ditch, and the houses built of rough stones, clay, and unburnt bricks, exhibit a mean appearance, and are ill suited to the grandeur which I expected to see in the capital of a great empire. But the Afghans are a rude unlettered people, and their chiefs have little propensity to the refinements of life, which indeed their country is ill qualified to gratify."

In the centre of the city there are four spacious bazars, or market-places, in a line, which consists of a range of apartments on each side, of two floors; the lower appropriated to merchants, and that above to private use. The intermediate space between the ranges is covered by an arched roof; and each bazar is separated by an open square, which was supplied by fountains, but now choked up with filth, or occupied by the meanest order of机械.

"The districts of Cabul," says Foster, "abound in excellent provisions, and its market is arranged in a neat manner, and more like that of an European town, than any I have seen in Asia. The fruits are of a good kind, and in great plenty, as apples, pears, peaches, pomegranates, and a variety of grapes."

This quarter of Afghanistan, or Cabulistan, possesses but few Indian productions: in return for sugar and cotton cloth, it sends iron, leather, and tobacco. The Tartars of Bochara bring to Cabul the horses of Turkistan, furs, and hides. The Uzbeks, Tartars frequent Cabul in great numbers; but the Hindoos, who come chiefly from Persia, contribute more than any other to enrich it, by their superior industry and knowledge of commerce; and they enjoy under the Afghan government, a liberty and protection, little short of that experienced by the inhabitants of our Indian possessions.

The environs of Cabul are chiefly occupied by garden grounds, and watered by numerous streams, the largest running through the city, and having a small bridge over it, affords a plentiful supply of water.

"The Afghans," to use the words of the author already quoted, "are the indigenous possessors of a tract of country which stretches from the mountains of Tartary, to certain parts of the Gulf of Cambay and Persia, and from the Indies to the confines of Persia. The inhabitants of this wide domain have no written character, and speak a language peculiar to themselves. (See Afghans.) They are a robust and hardy race of men; and being generally addicted to a state of predatory warfare, their manners largely partake of a barbarous insolence, and they avow a fixed contempt for the occupations of civil life. Though in some of our histories of Asia, the natives of Afghanistan are denominated Tartars, I am prompt to say that they bear no resemblance to that people, either in their persons, manners, or language." The Afghans are now generally allowed to be of Jewish origin; they indeed call themselves Mahometan Jews; and some modern writers have, perhaps with too much precipitation, pronounced them to be the remains of the ten tribes, which were carried captive from Samaria. (g)

CACALIA, a genus of plants of the class Syngenia, and order Polygania. See Botany, p. 296.

CACAO. See Chocolate.

CACHAO, CHUCO, CHECO, KEISH, KEEISH, or BAC-KIN, are the various names which have been given to the capital of the empire of Tunkin. The last of these names, which signifies the City of the North, has been recently given to this metropolis, since the extension of the power of the Emperor of Tunkin, on account of its situation towards the north of his dominions.

This town, which was formerly the residence of the Tunkinese monarchs, has neither walls nor fortifications. The streets, which are ill paved, are in general narrow, though some of them are wide and airy. The houses are low and mean, and are built of wood and clay, as the people are not permitted to build them of stone, nor above one storey high. The great buildings and the pagodas, are often made of wood, in order to resist the effects of storms; but in several of them, the principal walls are built of stones or bricks, and the rest of wood. Hence these edifices, with some appearance of symmetry, are extremely irregular, and represent a shapeless mass of buildings, though amidst this disorder they have often a majestic appearance, which indicates the grandeur of their possessor. From the immense quantity of wood in the houses, this town has been subject to frequent conflagrations. In order to prevent this calamity, every family is obliged to keep a cistern of water on the top of the house, and a long pole and bucket for the purpose of throwing the water upon the flame. Every family is likewise furnished with a low brick building like an oven, for the purpose of depositing their valuable property in case of any alarm from fire.

The principal building in Cachao, is the Chowra, or palace, which stood in the centre of the city, and comprehended immense gardens, and a great number of buildings. It occupied a space of two or three leagues in circumference, and was enclosed with a strong wall, in which there were four gates facing the cardinal points, and bearing their names. Before we can arrive at the interior of the palace, it is necessary to pass through several courts, in one of which are the barracks for the guards, and in the
other the stables for the elephants and horses. The principal part of the palace is a square building, (a form peculiar to the habitation of the sovereign,) which is ascended by steps of marble. It is two stories high; the halls are extremely large, and are adorned with great quantities of pillars, and a profusion of gilding. The ornaments, however, are of the most absurd kind, and the gold is laid on without either taste or judgment. The only ornaments which are really fine, are the pillars, made of iron wood, which is hard and compact, and of a deep brown colour. This wood has veins like marble, and is polished to such a degree by the dry leaves of the pine apple tree, that the gloss resembles that of the finest varnish, and almost appears like the lustre of glass. The columns, though colossal, are far from being well-proportioned. Those which are placed at the gate of the palace are about 40 feet high; their circumference at the base is five feet, and they diminish rapidly towards the top. The columns have neither capital nor pedestal, but are placed upon a square stone sunk in the ground. This palace was laid waste in the civil wars which a few years ago desolated the kingdom of Tunkin; but its ruins still attest its former magnificence.

The arsenal, which is a large building, stands on the banks of that branch of the river Song-kay, which is called Dombia. The house of the English factory is situated on the north side of the city, from which it is separated by the river; on the south side of this building is the Danish factory. The city is protected from the encroachments of the river by a long dike, built with timber and stone, strongly cemented together. In different parts of the city, even in dry weather, there are ditches of stagnant water and stinking mud, which are extremely disagreeable to strangers. The situation of the town, however, is healthy, and it is seldom visited by any of those pestilential diseases which are so common in many of the eastern cities.

The Emperor of Tunkin, who resides at Phu-xuan, the capital of higher Cochin-china, makes an annual visit to Cachao. The communes which lie in his route are obliged to furnish for the emperor and his suite, which resembles a little army, the necessary provisions, and also to build and furnish houses at the end of every four leagues. The furniture disappears after the emperor has passed, and must be again replaced at the next visit.

In Cachao there is a printing office, which is principally used for religious books, and for the promulgation of the laws. The characters are made of wood, and are not separate, but formed into plates as in stereotype printing. Population 40,000. E. Long. 105° 31', N. Lat. 22° 10'. See Exposé Statistique du Tunkin, de la Cochinchine, du Cambodge, du Tonkin, du Laos, du Lao-Thai. Par M. M., sur la Relation de M. de la Bisarche, Missionnaire dans le Tunkin. London, 1811. (o) CACHRY, a genus of plants of the class Pentandria, and order Digynia. See BOTANY, p. 165.

CACONGO, a small kingdom of Africa, in Lower Guinea, on the north banks of the Zaire, lies between the 5th and 7th degree of south latitude. It is bounded by the kingdom of Loango on the north, and by those of Congo and Angola on the east and south, and by the Atlantic Ocean on the west. The country is in general flat, but more salubrious and fertile than either Congo or Angola; and the inhabitants, though superstitiously addicted to the same heathenish rites as their neighbours, are rather more civilized. They are, however, represented as treacherous, turbulent, and cowardly; but carry on a considerable traffic with the Dutch and Portuguese, who are not obliged to give so many presents, in order to obtain permission to trade here as at Loango. This commerce consists chiefly in certain coarse cloths, which the Dutch call kassen-bladen, black knitted bonnets; shovels, hatches, and other iron tools; tobacco, powder, red wood, linen, and other merchandise, which they resell at Congo, Sonho, and other African states, or exchange for slaves. This kingdom is governed by its own hereditary prince, who, by certain laws of the state, is prohibited from touching any articles of European merchandise. It has a capital of the same name, which is situated in S. Lat. 5°, E. Long. 14° 20'. See Peucct Dictionnaire, &c. (L) CACOPHONY, in music, a term sometimes used to express a jarring disagreeable combination of sounds, or a noise. The effects of the wolves or highly tempered concords on keyed instruments, which result or come out from the tuning or adjusting a certain number of other concords, have been thus denominated by Mr Hawkes, and some other writers on the subject.

CADI. See TURKEY.

CADIZ, a city and sea-port of Spain, in the kingdom of Andalusia, is supposed to have been founded by the Phcenicians; who, being attracted by its commodious harbour and situation for commerce, first settled a colony here, and gave it the name of Gadia, or Cadira. It was afterwards incorporated with the Roman empire, and was honoured by that people with the title of Municipium. Upon the decline and dissolution of that power, it fell into the hands of the Saracens, who held it, with other parts of Spain, till near the middle of the 13th century, when it was recovered by the Spaniards, and when these intruders were expelled from the kingdom of Andalusia. In 1596, it was taken and plundered by the English under the Earl of Essex; and the attempt was repeated by the Duke of Ormond in 1702, but after landing his troops he found it impracticable, and returned. During the dreadful earthquake which demolished Lisbon, November 1st, 1755, the sea rising in an extraordinary manner, overflowed the country about Cadiz to a great extent, and by its leaving behind it wrecks, which appeared to have belonged to a temple, the tradition that the ancient city of Cadiz was for-
merly swallowed up by the ocean, was in some degree confirmed; and it is still said, that in very calm weather, when the tide is low, the ruins of the old houses, and the remains of the temple of Hercules, may sometimes be discerned under the water. Our belief in this tradition is also considerably strengthened by the opinion of some accurate observers, who assert, that while the sea without the straits of Gibraltar has encroached upon the land, it has receded proportionally on the coast of Spain within the straits, especially at Malaga and Carthagena.

The present city stands upon a tongue of land, projecting into the sea, and is strongly fortified both by art and nature. A steep and almost inaccessible shore defends it on the south; sand-banks and sunk rocks prevent every approach on the north; and on the south-east, where it communicates with the continent, it is protected by strong and regular bastions and out-works. Of its five gates, only one opens towards the land, which from the connecting causeway leads through the isle of Leon, and crosses the river Santi Petri by the bridge of Suazo. The streets of this city are regularly built, but rather crowded and narrow. They are, however, well paved, kept remarkably clean, and well lighted at night. The houses are neat, simple, and agreeable, with projecting roofs, made of Genoa slate, which gives rather a sombre appearance to the streets, but which affords a kind of shade in summer. The north-east side, which looks towards port St Mary, and which constitutes the most beautiful part of the city, the houses are lofty, and ornamented with painted balconies; and in front is a wide parade, well gravelled, and planted with trees, which communicates with the sea-road. The principal square, which is that of St Antonio, is very handsome. It has stone posts placed all round the centre, connected by an iron chain, to keep off the carriages. The ramparts form the Prado of Cadiz; and here, indeed, the walk is delightful, commanding on one side a prospect of the bay and the opposite shores, with various small towns, villages, and forts; and on the other, the unbounded view of the Atlantic, on which numerous vessels are daily seen making for other ports, and bound either from or up the Mediterranean. Besides the ramparts, they have another promenade, called the Alameda, which runs by the sea, on the side of the bay, towards the west. It has three large handsome walks, planted with elms and poplars, and adorned with elegant marble seats. It is also furnished with coffee-houses, is well lighted at night, and very much frequented. Among the public buildings, the new cathedral, when finished, will be far the most conspicuous; and if executed according to the plan which it now displays, will be one of the most magnificent structures in Spain. But there is no appearance, at present, of its being soon brought to such a conclusion. It is, however, defective both in elegance and simplicity, and will never be a handsome building. The domes are lofty; and the pillars are, in general, well proportioned, and of the Corinthian order; but it is encumbered with a multiplicity of useless decorations, and though yet unfinished and full of rubbish, the niches in the walls are already filled with marble statues of saints and angels, which have been placed there with a childish eagerness. The foundation was laid about thirty years ago, and it is computed that the whole will cost 1,500,000 crowns. The old cathedral is chiefly remarkable for its pictures, most of which are copies; and its treasures, which consist of gems, many large silver candlesticks and lamps, and three custodias, one of which is constructed of the finest silver, weighing 51 arabas, and another of solid gold. The church of the capuchins, the church of the oratory, and also some of the convents, contain some fine paintings by Murillo and other masters. The best collections of pictures, however, are to be found in the possession of private individuals. The house of Don Alphonso Ocreuly contains about two hundred, almost all originals, by Paul Vermere, Rubens, Van dyke, Pimbo, Murillo, Velasquez Cano, Ribalta, and the school of Breughel, &c.; and in the house of Don Jose Marti, to is to be found a superb collection of the works of Titian, Leonardo da Vinci, Velasquez, Murillo, Jules, Ribera, Herrera, Zurbaran, Jordan, Trevisani, Rosa, Vaccaro, and many other painters of the Spanish school. The asylum, or general work-house, is a handsome building, with Doric columns, and presents a front of 200 feet. It has several courts; and round the principal one is a gallery with sixteen columns of the Doric order. This asylum maintains above 800 paupers of every nation, age, or sex, who are instructed and employed in useful arts. The boys are employed in manufacturing silk, linen, cotton, and printed calicoes; the girls in spinning, in needle-work, and in household business; and the aged and infirm work according to their abilities and strength. This establishment was greatly improved by Count O'Reilly in 1785, but it again degenerated after his resignation. The other charitable institutions are; the royal military hospital, which accommodates 80 students, who are maintained and educated at the king's expense; two hospitals for the sick, one set apart for each sex; and an asylum for 47 widows, founded by a Turkish merchant.

The wealth of Cadiz arises entirely from foreign commerce. The advantageous situation of its harbour; its easy communication, by the Atlantic and the Mediterranean, with the different countries of Europe; and its extensive trade with the American continent, have rendered Cadiz one of the first commercial ports in the world. The trade with the Spanish colonies, which is by far the most useful and lucrative, and which was formerly confined entirely to Seville, was removed to this city in the year 1720, exclusive of all the other ports of Spain; and from its thus being the only channel through which the immense wealth of America flowed into the kingdom, it was soon raised to be one of the most opulent cities of Europe. This exclusive privilege it enjoyed

† This position of the temple of Hercules, however, has been disputed; some authors maintain that its site is at the mouth of the river Santi Petri, while others place it at Comil, a small town on the coast between Cadiz and Gibraltar.

‡ In the garden of the convent belonging to this order, there is a tree which yields the redous gum called dragon's blood, and which Mr Jacob supposes to be the only one in Europe.
for more than sixty years; and to give our readers some idea of the riches which entered its harbour and were disseminated over the kingdom, we shall transcribe the cargoes of two vessels, the Trident and Asturias, which arrived at Cadiz on the 25th of August 1760, the one from Vera Cruz, the other from the Havana.

**FOR THE KING.**

1,607,615 bars of gold,
400 plates of copper,
50 surons of cocoa,
834 do. of tobacco in powder,
26 bales of tobacco in leaves,
48 gold coins of different sizes,
2 bars of virgin silver,
600 chests of sugar,
9 large chests of chocolate and vanilla.

**FOR COMMERCE.**

4,856,062 piastres of gold and silver in coins and plate,
828 surons of fine cochineal,
192 do. of indigo,
3 do. of fine cochineal dust,
11 do. of mechoacan,
38 large chests of vanilla,
500 skins in the hair,
1 packet of emeralds,
86 large chests of tobacco in powder, jewels, and chocolate.

The fleet which left Cadiz the same year for New Spain carried out
36,879 quintals of iron,
10,672 do. of steel,
24 do. of nails,
571 do. of wire,
360 do. of manufactured iron,
118 do. of pack-thread,
1,337½ do. of pepper,
2,579½ do. of oil,
9 do. of almonds,
188 do. of raisins,
44 do. of white-lead,
15,209 do. of wax,
173,870 pounds of cinnamon,
719 hogheads of tin,
10,244 do. of wine,
393,842 reams of paper,
29,305 pieces of Brabant,
1,636 do. of German linen,
740 chests of books and medicines.

All the productions of the Spanish colonies were poured into Cadiz; and all the manufactures of the kingdom, as well as merchandise from various other countries, were transmitted through this channel to the ports of New Spain. But this privilege of exclusive commerce with the New World was taken from Cadiz above thirty years ago, and several other cities of Spain have been since allowed to share it equally. Cadiz has suffered considerably by this measure. It still, however, retains the greatest influence. Most of the galleons unload here, and it sends out and receives the richest fleets. In the year 1791, 176 Spanish vessels from America entered this port, by which it received gold and silver, coined and uncoined, to the amount of L.5,389,203 sterling; and 101 vessels cleared out for the different ports in that country, whose cargoes of national productions or merchandise were valued at L.1,190,629 sterling. In 1792, it exported national goods to the amount of L.4,812,500, and received from America imports to the value of L.7,295,933. But this trade was dreadfully reduced by the war in 1801, when Spain joined France against Britain. In that year, only 20 ships entered from America, and 50 cleared out; of which 42 were for Vera Cruz, and the rest for Carthagena, Monte-Video, and Guayra. But, independent of its traffic with the New World, Cadiz carries on a very considerable commerce with most of the nations of Europe. Foreigners from every country have factories, magazines, and houses, in this city; of which the principal are Irish, and but very few English and Dutch. It has about 720 commercial houses, exclusive of retail dealers, most of them Spanish. Its harbours are continually crowded with ships from every part of the world; the bay is scarcely ever without five or six hundred; and it has been computed that about a thousand vessels annually enter its ports. In 1791, the number amounted to 1010; viz. 180 English; 116 French; 104 Portuguese; 80 Dutch; 6 Genoeses; 84 Ragusians; 2 Venetians; 25 Swedish; 41 Danish; one Russian; one Hamburgh; one Imperial; 90 Americans; and 339 Spanish, of which one was from Manilla, 176 from America, and 162 from the ports of Europe. Before the revolution in Spain, the principal trade of Cadiz had been engrossed by the French, who furnished it with woollen cloths from St Valery, Amiens, Havre, and Rouen; linens from Morlaix, St Malo, and Nantes; pitch and tar from Bayonne; and lard and meal from Bourdeaux; also silks, gilt articles, iron ware, &c. from Marseilles, to the annual value of more than L.500,000; and the fruits and productions of the French colonies in America; with the merchandise of the East Indies and China, which were brought in French vessels direct to Cadiz. From Britain it received pewter, lead, copper, corn, stock-fish, cutlery, earthen ware, clock-work, drabs, druggets, frizes, and different kinds of stuffs; and linen and spices from Holland. Its exports to the different cities of Europe consist of wool, wine, oil, brandy, olives, citrons, oranges, raisins, figs, vermillion, cochineal, indigo, vanilla, jape, bark, Vicuna wool, cocoa, Brasil and Campeachy wood, hides, tobacco and salt. This last article of traffic, which is obtained from the salt pits of Puerto Real, alone amounts to upwards of L.500,000 sterling. The sherry wine which is annually exported from Cadiz, is about 25,000 quintals.

The manufactures of Cadiz are almost entirely confined to ribbons and silk net-work, which employ about twenty looms; and a few linens. They make also vases of a kind of white earth called barro, which are used for filtering water.

The spirit of speculation and of trade, which prevails so much in this great commercial city, has completely absorbed all taste for science and for litera-
The climate of Cadiz is very healthy; almost surrounded by water, the heats of summer are moderated by the sea-breeze; and, except when the solana or south-east wind prevails, few places enjoy a more happy temperature. This wind passes over the scorching plains of Africa, and is said to have a curious effect in inflaming the passions: for, during its continuance, it has been observed, that the most irritable of the inhabitants commit every species of excess. This city is well supplied with every kind of provisions; its fruits are cheap, and the best wines are made in the neighbourhood; but lodgings are immoderately high; and all the necessaries of life are at an exorbitant price. Luxury is here carried to its greatest height, and extends to dress, carriages, houses, furniture, servants, table, &c. Every moment that can be spared from business is employed in dancing, gaming, plays, and company. The entertainments are frequent, brilliant, and sumptuous, and served with great neatness and delicacy. The higher classes are very hospitable to strangers, and possess a frankness and politeness of demeanour which is seldom found in the other cities of Spain. Cadiz had formerly a French theatre and an Italian opera, both of which were of short duration. The building of the latter has been converted into a reading room, called the Camorra. The national theatre is built and laid out with great taste, and is both large and commodious. It is the great resort of the higher classes; but every part of the house is private property, except one bench in front of the boxes. Gaming is the prevailing vice of this city, and is, in general, carried to a very censurable extent. An amusement common in Cadiz, is mentioned by Mr Semple in his second journey in Spain, which presents us with a faint specimen of the ancient tournament, and is to be met with, perhaps, in but few other parts of Europe. "A stand, ornamented with the arms of Spain," says he, "was erected in the centre of the great market-place, on which were placed hasted swords and daggers of various lengths. A tall old man, with a large rapier, acted as umpire of the lists: the people collected, and a large ring was made. A champion approached, examined the weapons, and having found one to suit his purpose, he grasped it, and threw down his glove upon the ground. After walking to and fro for some time, an antagonist presented himself, who took up the glove, and then threw it down with contempt. He was suited with a sword; the two heroes approached, touched their hats to each other, saluted the master of the lists, and tried the length of their weapons. All being arranged, the old man gave the signal, by a motion of his rapier, and the battle began. It was contested with great skill on both sides. After a certain number of hits, the umpire declared who was the conqueror. The two parties then went round the ring, collecting donations in the hilts of their swords; and, if they had shewn much skill, had seldom reason to complain. "If the combatants at any time became irritated, the umpire separated them until they grew cool. In the very heat of the affray, while swords and daggers were clashing, and the spectators watching the gestures of the combatants in profound silence, the sunset bell tolled, and the weapons were immediately deposited upon the stand,—all hats were off,—and the crowd dispersed, muttering the evening prayers to the virgin."

During the fine seasons of the year, parties of pleasure crowd to Chiclana, a village about four leagues from Cadiz, and which consists chiefly of pleasure-houses belonging to the inhabitants of that city. It is a most delightful spot, and commands a fine view of the bay, the town, and the sea. But, in the midst of pleasure and profusion, this city is attended with one very great inconvenience—the want of good water. Its well water is hard, brackish, and unwholesome; and what is generally used is brought from the port of St Mary, in boats kept for the purpose, the annual expense of which is estimated at about £20,000. This resource, however, also sometimes fails them, particularly in times of drought, or even when the sea is rough, or the winds contrary. What they use for the domestic purposes of washing, &c. is the rain-water which falls in the inner courts of the houses, and is collected in cisterns. The ice, which is used in great quantities, for cooling wine, making creams, &c. is brought from the mountains of Ronda.

Cadiz is the see of a bishop, who is a suffragan to the archbishop of Seville. The see was removed from Asidonia to this city in 1292, in the reign of Alphonso the Wise, when the church of Santa Cruz was erected into a cathedral. Its dioecesis extends only over fifteen districts, containing twenty-eight parishes. The chapter of the cathedral is composed of six dignitaries, ten canons, four prebendaries, and eight demi-prebendaries. The government of Cadiz consists of a governor, a king's lieutenant, two assistant majors, and two alcaldes major for the administration of justice; and, as this city is one of the three departments of the royal navy, it has also a captain-general, a major-intendant, an accountant-general, two treasurers, a post captain, a marine minister, and two marine auditors. Since Seville fell into the hands of the French, it has been the residence of the supreme legislature, and of the executive government of the kingdom.

The bay of Cadiz is one of the finest in the world;
has capital anchorage ground, and is from ten to
twelve leagues in circumference. It is every where
protected by mountains, except on the west, where
it opens towards the ocean, and where it is defended
by the forts of St Sebastian and St Catherine. The
entrance into the inner bay, where the ships of war
generally lie, is strongly defended by forts Louis and
Matagorda, whose fires cross one another, and also
by Punat fort on the opposite shore. On the eastern
extremity of this bay is the Caraca, or royal
dock yard, which contains twelve docks for building
all sorts of ships of war; and three great basons, one
for careening frigates, and two for careening ships of
the line of all rates. It has immense magazines of
naval stores, consisting of cloth, cordage, cables, an-
chors, arms, timber, yards, masts, and sheets of cop-
per. Cables, sail-cloth, and ropes, are made here;
and 5518 shipwrights and others are constantly em-
ployed throughout the year.

"The rocks near Cadiz," says Mr. Jacob, "are of a
very singular structure. The basis of their compo-
sition is probably pechstein; and in this, by its glu-
tinous power, the shells, pebbles, quartz, sand, and
marble have been so intermixed and hardened in the
course of years, as to form a compact kind of stone.
This glutinous matter is at first of a greyish black;
but in process of time, when mixed and combined
with other substances, changes into a very light yel-
lowish colour: it possesses so much tenacity, that
pieces of brick, tiles, chalk, shells, and other rubb-
ish thrown into the sea, become incorporated with it,
and in time so firmly united, as to appear a piece
of solid stone. It forms an excellent stone for build-
ing, is easily worked, and very durable."

In the neighbourhood of Cadiz is an extensive tun-
ny fishery, which is a source of great traffic and pro-
fit to the inhabitants. They have a particular
method of salting and preserving these animals, by
which they can export them in good condition to any
part of the world. Though this fish was well known
to the ancients, who made it a great article of com-
merce, and there are still some considerable tunny
fisheries on the coasts of Sicily and other parts of
the Mediterranean sea; yet the inhabitants of Cadiz
owe the discovery of it upon their own shores enti-
rely to chance. A party of fishermen, when nav-
gatiating towards the north-west, came to a part of
the sea which was filled with moss and sea-weed.
Perceiving under the weeds an immense number of
tunnies, which they called athumas, they caught as
many as they were able; and having cured them ac-
cording to their own fashion, put them in barrels, and
carried them home. They afterwards exported them
to different parts in the Mediterranean, where they
met with a prodigious sale; and this traffic is now
extended to almost every part of Europe. It was in
gratitude for this discovery, we are told, that the city
of Cadiz stamped upon one side of its coins two tun-
nies, and the temple of Hercules on the other; ac-
knowledging that it was to them it was indebted for
the high station which it held among the cities of the
world. The tunny fishing commences here in the be-
inning of May, and lasts until the middle of June.

At Cadiz, the common period for bills of exchange
with England, Holland, Hamburg, and other for-
ign countries, except France, is sixty days after
the date of the bill, with six days of grace. With
France, it is only a month, with the same number of
days of grace.

The population of Cadiz, according to M. de La-
borde, is computed at 70,000. Mr. Townsend, who
visited Spain in 1786-7, reckons it at 65,987, and
says, that about ten years before it had been esti-
\ated at 85,000, besides 20,000 persons who entered
daily from the sea, and the adjacent country. At
this place, the tide runs north-east and south-west;
and at spring tides, it is high water at half past four
o'clock. W. Long. 6° 11' 50", N. Lat. 36° 31' 71".

CADMUS, in fabulous history, the son of Age-
nor, king of Phoenicia, and brother of Europa. His
sister having been carried off by Jupiter, he was or-
dered by his father to go in search of her, and not to
return till he had found her. Being completely dis-
appointed in the object of his mission, and not daring
to return into his own country, he began to look out
for a place in which he might fix his residence. By the
advice of the Delphic oracle, he followed a cow, and
where ever she lay down he determined to build a city.
In the mean time he sent his associates to a fountain
to bring water; they were all destroyed by an enor-
mos serpent. Cadmus not knowing what detained
them, went in search of them, when he saw the dead
bodies, and the monstrous serpent lying beside them.
He immediately attacked the monster, and after a
dreadful contest, which is beautifully described by
Ovid, he slew him; and by the advice of Pallas
sowed his teeth in the ground, from which imme-
diately sprang up a crop of armed men, who were
prepared to assail Cadmus. By the direction of Pal-
las, he threw a stone amongst them, when they im-
mEDIATELY turned their arms against each other, and
all fell by mutual slaughter, except five, who assisted
him to build the walls of Thebes. Cadmus and his
wife Hermione, who was given to him by the gods,
were themselves at last changed into serpents.

Such is the fabulous history of this celebrated per-
son, from which it will be extremely difficult to ex-
tract anything like a rational meaning. It is not
easy to account for the frequent introduction of the
serpent in this story. Shuckford has given a Hebrew
sentence descriptive of the exploits of Cadmus, which
may either be translated "he raised a company of
men armed with brazen weapons," or "he raised
five armed men from the teeth of a serpent." This
is merely conjectural, although we think it extremely
probable that the greater part of mythological fables
have arisen from mistranslation.

The learned Buchart has also endeavoured to show,
but on different grounds, that the fabulous story of
Cadmus has arisen from the errors of the Greeks in
interpreting the Phenician or Syrac language. He
supposes that Cadmus was a Hivite, who fled from the face of Joshua; that the Hivites were called Cadmonites, which signifies easterlings, because they inhabited Mount Hermon, the most eastern part of Canaan; and that Hermione or Harmonia, Cadmus's wife, had her name from this mountain. He explains the fable of their being changed into serpents, from the circumstance of their retaining the name of Hivites, which word, in the Syriac language, signifies a serpent. We want nothing here but facts, to establish the ingenious conjectures of the mythologist.

Sir Isaac Newton, with a facility of assumption which he would have been the last to countenance in physical science, supposes that Cadmus headed a colony of Phoenicians and Syrians, who fled from the conquests of David; and he alleges that he flourished about the year 1046 A.C.

Mr Bryant disputes the existence of Cadmus as an individual; but thinks, according to his usual mode of interpreting mythology, that what is in this case ascribed to an individual, applies only to different colonies, which at various periods emigrated from the East into Greece. Cadmus, in Hebrew, signifies the East.

The only thing which seems to be known with tolerable certainty, is, that Cadmus first introduced the knowledge of alphabetical letters into Greece. The Cadmean letters were sixteen in number, α, β, γ, δ, ε, ζ, η, θ, ι, κ, λ, μ, ν. To these, four were added by Palamedes, in the time of the Trojan war, ρ, ρ, π, ς. The other four were afterwards introduced by Simonides. (g)

CAECILIUS STATIUS, an ancient Roman comic poet, the contemporary and friend of Ennius, was originally a slave, and a native of Insubrian Gaul. (Aul. Gell. iv. 20; Cic. Orat. ii. 10.) The ancient authors have given us little information concerning him or his writings; but he is classed among the few Roman poets who acquired any reputation by his comedies. Horace contrasts him with Terence; the former, he says, excels in gravity, the latter in art. (Epist. ii. i. 59.) He is also commended for his wit and humour, (Paterc. i. 17;) but his style is censured by Cicero: Malus enim auctor Latinitatis est. Att. vii. 3.

The fragments of Caecilius have been collected, and commented upon by H. Stephen. See also the Corpus Poetarum of Maittaire (z)

CÉMENT. See CEMENT.

CAEN, CADOMUS, or CATDOM, a city of France, in Lower Normandy, and capital of the department of Calvados, is situated in an extensive and fertile valley, at the confluence of the rivers Orne and Odon, about 67 leagues west from Paris. It is surrounded by a high wall flanked with 21 towers, and further defended by a strong castle; part of which is said to have been built by the English when they held the sovereignty of the country. The town hall is a large building, with four turrets; and the place royale, which is a spacious and regular square, is adorned with some very fine houses, and has an equestrian statue of Louis XIV., in a Roman habit, in the centre. Including the four suburbs, Caen has 12 parish churches, an episcopal palace, 2 abbeys, and 14 convents. The abbey of St. Stephen was built by William the Conqueror, and contains the ashes of that monarch. This town has also a celebrated university, which was first founded by Henry VI. of England, in 1431, for the study of civil and canon law; the faculties of theology and the arts being added in 1436, and that of medicine in the following year, by letters patent dated from Kensington; and an academy of sciences, instituted in 1706; a society of agriculture and of commerce; a lyceum, a school for navigation, a botanical garden, and a public library.

Caen has a great variety of manufactures, of which the principal are, drabs and other woollen stuffs, ratteens, sergeis, fustians, linens, dimities, hosiery, lace, porcelain, iron-ware, and some extensive tan-work. The drabs and ratteens are made of Spanish wool, and are in general carried to Paris. The serges are fabricated from the wool of the country; and formerly constituted the chief manufacture of this city. Before the Revolution it employed 190 looms and 250 workmen, and annually furnished from 4000 to 5000 pieces. But this number, from the numerous establishments of similar manufactures throughout France, has been reduced to nearly a third. The stocking manufacture has experienced a similar reduction, and of 500 workmen, who were formerly engaged in this trade, scarcely 100 remain in the city of Caen. Its tanneries, however, still maintain their reputation, particularly for strong leather. They work nothing but foreign hides, which they derive from St Domingo, Brasil, the Havanah, Cartagena, Curacao, and Mexico, and which they prepare in a manner equal to any place in France.

Caen is conveniently enough situated for commerce, as it has a direct communication with the ocean by the river Orne. Its foreign trade, however, is chiefly confined to the cities of Amsterdam and Rotterdam; from whence it draws oak and fir planks, tar, camphor, green wood, Japan wood, and other dye woods, alum, galls, vitriol, sulphur, oil, copperas, whale bone, lint, seed, gum arabic, steel, tobacco pipes, dwarf-ware, white thread for lace, cheese, linen, and iron and copper ware; for which it returns paper, sherbet, junipers, honey, the horns and hoofs of sheep and oxen, green and dried pears, prunes from Maine, raisins from Provence, and sometimes eggs for the refining of sugar. Caen carries on also a considerable maritime traffic with Rouen and Havre de Grace, where it sends paper, iron, &c., and receives in return, copper and iron ware, groceries, and various other articles of national and foreign merchandise. But the most active trade is carried on at the free fair, which is held here on the second Monday after Quasimodo, and lasts for 15 days. This fair is one of the most crowded in the empire. Merchandise of every description, particularly woollen and linen manufactures, meet with a ready market; and cattle and horses are brought here from every quarter of Normandy and the neighbouring provinces. The goods are generally exposed to sale in booths, built under a covered market place, or under a wooden shed covered with cloth. The payments commence on the 14th day of the fair, and the protests are made on the 16th. Caen has seven other fairs during the year, each of which, however, continues only for one day. The interior commerce of this city, according to the Abbé Expilly, amounted in 1772 to nearly 4,500,000 livres.
Caerphilly, Caerphilly, or Caerphil-
y, (a word signifying a castle of haste), is a small
town of South Wales, in the county of Glamorgan,
remarkable chiefly for the ruins of an immense
castle. It is a neat town, with many good houses, and
is situated in a broad valley, and encircled with barren
and dark mountains. The Roman coins found among
the ruins, sufficiently indicate the high antiquity of
the place. The castle of Caerphilly is supposed by
Warner, to have been originally erected in 1090, by
Robert Fitzhamon, lord of the bedchamber to
William Rufus; but it is the opinion of Daines Bar-
ington (See Archæologia, vol. i.) that it was erected
by Edward I. This extensive structure is said to
have once covered an area of two acres, whilst its fosse
was crossed by thirteen drawbridges. Its ruins are
highly interesting both to the painter and to the
architect. The citadel, which resembles a separate
castle, is inclosed by two moats; and its gateway,
which is a high Gothic arch, having its centre sup-
ported by two circular bastions, forms the western
entrance to the inner court. A range of noble ap-
artments, communicating with a long gallery, surrounds
this court. The great hall, which is 70 feet by 30,
and 17 feet high, is a fine specimen of Gothic archi-
tecture. The north window of the chapel is very
perfect and elegant; and the mint, which is arched
in a curious manner, is furnished with two furnaces
for melting metal. At the east end of the inner
court is the leaning tower, which is a circular build-
ing 80 feet high, and deviates 11 feet from a vertical
line.

The inhabitants of this place are principally em-
ployed in the manufacture of pig and bar iron. Here
is also a small manufacture of stockings and blankets;
and at the fairs are sold horned cattle, horses, sheep,
pigs, and yarn stockings. Number of houses 70;
population 200. See Archæologia, vol. i. Warner's
Tour in South Wales. Evan's Tour in South Wales,
1804. And Malkin's Scenery, Antiquities, and Bio-
graphy of South Wales, 1804. (2)

CAERLEON, the Isca Silurum, Isca-colonia,
and Isca-legendis secunda of the Romans, is a small
town in Monmouthshire, situated on the river Uske,
which is crossed by a long wooden bridge. The
numerous remains of ancient splendour which have
been found in this place; the altars, pavements, sta-
tues, inscriptions, and coins, which have at different
times been discovered, sufficiently shew that it was
formerly a great Roman city; while the bricks and
tiles, with the inscription of Leo. II. Aug. prove
it to have been a station of the second Augustan le-
gion of the Roman army. While the Romans re-
mained in Britain, Caerleon was the seat of govern-
ment for that division of the island, which was called
Britannia Secunda. In subsequent times it was the
object of numerous contentions between the English
and the Welsh, till it was finally possessed by the
English, after the subjugation of the Welsh by Ed-
ward I. It continued long in the possession of the
crown, but afterwards came into the family of Mor-
gan of Lantarnon, and is at present the property of
Mr Blanning.

The description of this place by Gyraldus Cam-
brensis, who visited it in the 12th century, is partic-
ularly worthy of notice. "Many remains," says
he, "of its former magnificence are still visible;
splendid palaces, which once emulated with their
gilded roofs the grandeur of Rome,—for it was ori-
ginally built by the Roman princes, and adorned
with stately edifices,—a gigantic tower, numerous
baths, ruins of temples, and a theatre, the walls of
which are partly standing. Here we still see, both
within and without the walls, subterraneous build-
ings, aqueducts, vaulted caverns, and, what appeared
to be the most remarkable, stoves so excellently con-
structed as to diffuse their heat through imperceptible
pores." This description has been sufficiently con-
formed by the antiquities which have at different pe-
riods been discovered. The form of the place, as
delineated by the remains of the dilapidated walls,
appears to have been nearly a parallelogram with a
circular end, including an area of 580 yards by 460.
The present height of the parts of the walls that
remain is only about 14 feet, and their greatest
thickness about 11 or 12 feet. They are built of
limestones, imbedded in cement, some of which
seems to have been tempered with pounded brick.
They were faced with hewn-stone, but the facings
have now been removed. The whole was surround-
ed by a fosse; and four gates, one of which was in
the centre of each wall, led to the stations in the
other parts of the district. A concave space in the
centre of this fortress, commonly called King Ar-
thur's Round Table, has been supposed by some the
site of a magnificent temple dedicated to Diana,
while others more probably imagine it to have been
an amphitheatre. The remains of stone seats which
were discovered around it, seem to prove that it was
a lapidarium, and not a campestrian amphitheatre.
Although the area within the walls of Caerleon is
only about 1800 yards in circumference, yet the
suburbs extended to a great distance, and are said
to have covered a tract of country about nine miles in
circumference.

The greater part of the antiquities found in this
town have been carried away to other places. A
few coins,—a rude sculpture, in basso relievo, of a
Venus Marina holding a dolphin in her hand, with
the carving of a large marine shell on the reverse,—
and an antique intaglio, are the only specimens which
remain. In 1755, a subdatory was discovered in a
field near the river. It was formed of columns, con-

* The name Caerleon has been generally derived from Caer, a fortified place, and legio; but the author of the Welsh Dic-
tionary contends, that the name should be Caer-Etia, or the city of Waters; while others suppose that it should be Caer-Adf, which would signify the fortified and learned city.
constructed of round bricks, fourteen inches in diameter, and four thick. A tesselated pavement, in a perfect state, was found in an adjoining apartment. Bricks blackened with fire, and leaden-pipes, were also found in the same place. In 1692, a tesselated pavement, fourteen feet in diameter, was found in a field; it had variegated borders of white, blue, and red tessellae, surrounding figures of birds of the same colours. There was also on this pavement a figure of Diana, which Camden describes as clad "in tuckit up garments, with a quiver, but without head, hands, or feet." The present market-house of Caerleon is supported by four short and massive Tuscan columns, which Mr. Coxe supposes to have belonged to some ancient Roman structure. Several inscribed pillars were lately dug up near the centre of the old city; and the votive stone, with the inscription

T. FL. POSTUMVS VARUS
V. C. LEG. TEMPL. DIANAE
RESTITVT

has induced antiquaries to believe, that this spot has been the site of the temple of Diana. Several votive altars have likewise been discovered. One of these is to the Emperor Aurelius Antoninus, and Severus Lucius his son, and alludes to the second Augustan legion. In another, the epithet Dolichius is applied to Jupiter, alluding to his being the protector of iron mines; and in a third, dedicated to Antoninus and Geta, the word Caesar is added to the latter name. Coins of every period of the Roman empire have likewise been found here; and numerous antiquities, such as bronze figures, lamps, fibulae, scats, rings, &c.

The ancient castle of Caerleon appears to have extended between the south side of the Roman wall and the river. On the high mound of earth called the Keep, to the north of the town, was formerly a gigantic tower, mentioned by Gyralds; but the only remains of it are a variety of stones near its base. There was also in this town an abbey of Cistercian monks situated in the High Street, where there is an old house, which is the only remains of the monastery. The wooden bridge over the Uske is said to resemble Cæsar's bridge over the Rhine. The floor, supported by ten high piers, is horizontal, and is divided by posts and rails into rooms or beds of boards, each of which is twelve feet long. As the height of the water at extraordinary tides sometimes exceeds thirty feet, parts of the bridge have been carried away. On this account it is about to be replaced by a bridge of stone. The inhabitants are chiefly supported by the extensive tin works of Mr. Butler, in the vicinity of the town, at which from 14,000 to 20,000 boxes of tin plates, each containing from 200 to 300 plates, are annually manufactured. There is also an iron forge here; and, by the flowing of the Uske, the town possesses a small share of the coating trade to Bristol. The gardens and orchards of Caerleon are covered with great quantities of cinders, containing much iron. They are called Roman cinders, and appear to be the remains of ore imperfectly smelted by the Romans in their open bloomeries. Number of houses 148. Population 667. See Evans's Tour through South Wales, 1804. Warner's Tour; Coxe's Historical Tour in Monmouth.

shire, 1801; Powell's History of Wales; but particularly the Beauties of England and Wales, vol. xi. p. 125. (v)

CAERMARTHEN, or CARMARTHEN, the Mardium of Ptolemy, and the Caer-syrion of the Brittons, is the principal town in the county of Caerleon, in South Wales. It is situated in a fruitful valley, on the acclivity of a steep hill upon the north bank of the river Towy or Tobina, over which there is a long narrow bridge of six arches, with other four in the parapet at the south end, to allow the water to pass when the river is swollen. The streets are numerous and handsome, though some of them are steep and irregular; and many of the modern houses are well built, and reckoned the best in South Wales. The principal public buildings are, the church, the town-hall, and the county gaol. The church, which stands without the town, at the end of Prior Street, is a very large building, and is dedicated to St. Peter. The town hall is a handsome edifice, built of freestone, with colonnades of the Ionic order: The lower part of it is used as a covered market. The county gaol, which occupies the site of the old castle, is handsomely built of hewn stone.

Although this town is eight or nine miles from the sea, yet the tides, which rise from eight to twelve feet, carry vessels of 100 tons burden up to the quay, which is very convenient for loading and unloading merchandise, and thus enables the town to carry on a considerable coasting and inland trade, which has greatly increased since the decline of the trade at Kidwelly.

The principal manufactures of Caerleon are those of tin plate and cast iron, which are carried on to a considerable extent. There is also a rope-walk here, and a few vessels are built for sale. The town is well supplied with salmon and other fish, and provisions are in general reasonable.

Caerleon was formerly defended by walls, and a strong castle, the gate of which only remains. The walls of a priory of the Fratres Grisei still exist, adjoining Lammas Street; and in Priory Street are the walls of another priory for six black canons, erected to the honour of St. John the Evangelist, and founded before 1148. The principal apartments in the latter building may be still distinguished.

This town is famed for being the birthplace of the celebrated magician Merlin Ambros. On Martin's Hill, near the tower, is a rock called Merlin's Chair, from which the prophecies of the magician are supposed to have been uttered.

The government of the corporation is vested in a mayor, two sheriffs who are chosen from the aldermen, a recorder, and other officers. The chancery of exchequer of South Wales have been kept here since Wales was erected into a principality; and there is also here a court for the registry of wills, under the jurisdiction of the bishop of St. David's. Caerleon was erected into a borough by 38 Henry VIII., and returns one member to parliament. Number of houses 945; population 5548. See Evans's Tour through South Wales; Malkin's Scenery, Antiquities, and Biography of South Wales; Barber's Tour through South Wales; and the Description of England and Wales, vol. i. p. 182. (v)
CAERMARTHENSHIRE, one of the counties in South Wales, is bounded on the south by St. George's Channel, on the west by Pembroke and Glamorganshire, and on the east by Brecknockshire and Cardiganshire. The general appearance of this county is hilly; and towards the north and east these hills rise into mountains. The county is almost everywhere intersected with small narrow valleys, from the skirts of which the hills rise abruptly. The principal of these valleys is the vale of Towy, which extends thirty miles up the country, and in some places is above two miles broad. It abounds in picturesque beauties; and from the classical spot of Grongar-hill, immortalised by Dyer, and the ruined castle of Dynevor, the richest prospects are to be seen.

The principal rivers in this county are the Towy, the Taw, the Cothy, the Dulas, and the Gwilly. The Towy, which rises in Cardiganshire, enters Caermarthenshire at the north-east side, and running south-south-west, it empties itself into a large bay formed by the whole coast of the county, and inclosed by the projecting shores of the counties of Pembroke and Glamorgan. The river Cothy rises on the north side of the county, and runs chiefly in a southern direction, till it falls into the Towy, about six miles above Caermarthen. The Taw, Tave, or Teivy, has its origin in Cardiganshire, and afterwards forms the boundary between that county and Caermarthenshire: After watering the north-west side of the country, it receives the Keach, and then bends its course into the county of Pembroke.

The climate and soil of this county are much celebrated. The air is reckoned milder and more salubrious than that of most of the adjacent counties; and the soil, which is less rocky and mountainous, is more fruitful in grass and corn. The flat tract of ground near Laugharne, which is embanked from the sea, is singularly fertile. The climate, however, is not favourable to wheat. barley succeeds better; and very considerable quantities of oats are annually exported to Bristol and other places. Horses and black cattle are reared in great abundance on the hills, and forms the chief article of trade in the different fairs. The county affords good pasturage; and a great deal of butter is made for exportation. The rivers of the county abound in fish; and excellent salmon, and a delicious species of trout, called suen, are obtained in great quantities. The county was formerly clothed with a very considerable quantity of wood, but of late years it has suffered great diminution. Limestone is very plentiful; and there are several mines of lead and iron. There are great lead mines some miles to the north of Llandover. The working of these mines, and the manufacture of woollen stockings, form the principal employment of the inhabitants. A considerable quantity of pine, and tinned iron plates, are exported from Llanelli, which is situated upon a arm of the sea called Burry River, which runs between this county and Glamorgan. The exportation of coals has been greatly facilitated by a canal, which has been cut from some collieries to Kidwelly, a small town situated on a creek near the mouth of the Towy.

The length of Caermarthenshire, from east to west, is about 45 miles; and its extent, from north to south, is about 20 miles. It contains about 962 square miles, or 590,040 acres, of which 228,000 acres are in pasture, 114,000 in tillage, and the rest in a state unfit for cultivation. It is divided into eight hundreds, viz. Carnwallon, Carthing, Caw, Durlis, Elvet, Iskenne, Kirkwelly, and Perfedd. It has five market towns, Kirkwelly, Llandiloova, Llanfair, Llangarne, and Llandovery; and contains 145 parishes, 13,449 inhabited houses, 67,317 inhabitants, 31,439 males, and 33,878 females, of whom 4934 were returned as employed in trade, and 32,362 in agriculture. The money raised for the maintenance of the poor in 1803 was £17,046; at the rate of 12s. 9d. in the pound; and the amount of the assessments under the property tax for 1806 was £378,814.

Several vestiges of Roman roads, and other remains of antiquity, are still visible in this county. In Cardreadychan, to the east of Caermarthen, are the ruins of Kastelh-Karrey. It was once a large fort, and is situated on a steep and almost inaccessible mountain, near which, at a place called Kako, are some immense caverns, which are conjectured to have been copper mines wrought by the Romans. At Kastelh-Karrey there is also a fountain which ebb and flow twice in 24 hours. In the neighbourhood, at a place called Pont-y-Polion, were found two sepulchral stone monuments with inscriptions. One of these lay flat on the ground, and was placed across a gutter; the other, which seems to be of a later date, is about a yard high, and is placed on one end. In the parish of Llan Newydd, or Llaneuad, a rude stone pillar, about six feet high and one a half feet broad, is erected near the highway, with the inscription Severinini filii Severi. There are also several other pillars of this kind in different parts of the country, with Roman inscriptions. In the parish of Trelech, about 8 or 9 miles north of Caermarthen, there is a barrow called Krig y Dyrm, consisting of a large heap of stones about 18 feet high, 150 feet in circuit, and covered with turf. It rises with a gradual ascent from the circumference to the centre. It is hollow on the top, upon which there is a rude flat stone of an oval form, about 9 feet long, 5 feet broad, and one foot thick. This stone covers a kind of stone chest, consisting of six other stones.

A considerable quantity of silver coins of several Roman emperors were discovered about the beginning of the 17th century, at Kilmaen Llwellyn, and in the neighbourhood of a place called Bronyskawen, is a large camp named Caer. It is of an oval form, and about 300 yards in circumference. The rampart or bank near the entrance, is about three yards high, but in other parts generally much lower. There is a barrow on each side of the camp. The smallest one is near it, and the other at the distance of 300 yards, and both of them are hollow at the top. In the entrance to the camp, which is four yards wide, near the surface, two rude leaden boxes were discovered in 1829. They contained 200 Roman silver coins, several of which were very ancient. See Description of England and Wales, vol. i. p. 178; Evan's Tour through South Wales; Barber's Tour through South Wales; and Malkin's Scenery, Antiquities, and Biography of South Wales.
CAERNARVON, the Segontium of Antoninus, and the Caer-Seint of the Britons, is the principal town of Caernarvonshire, one of the counties of North Wales. This town is pleasantly situated opposite to the isle of Anglesea; having on one side the arm of the sea called the Straits of Menai, on another the estuary of the Seiont, where it receives the tide from the former; on a third side, and on part of the fourth, it has a creek of the Menai; and the remainder, according to Pennant, has the appearance of having the insulation completed by art. At a little distance from the town, and about a quarter of a mile from the Menai, is the ancient Segontium, which covers an oblong space of about six acres, and is placed on the summit of a rising hill sloping in every direction. There are vestiges of walls in several parts; and in one place is the remains of a building made with tiles, and plastered with hard and smooth mortar. A public road passes through the middle of this station.

The present town was built by Edward, after he conquered the country in 1282. It was finished in one year, and the fortifications and castle were completed before 1294. The walls and the exterior of the castle are at present exactly the same as they were in the time of Edward. The walls have a number of round towers, and two principal gates, one of which faces the east, and the other the west. The entrance to the castle is beneath a massy tower; and over the gate-way, which had four portcullises, is placed the statue of Edward in a menacing attitude, with a half drawn sword in his hand. The castle occupies an oblong space of three acres. All the towers are either pentagonal, hexagonal, or octagonal, and two of them are much more lofty than the rest. The eagle tower, which derives its name from the figure of that bird placed upon its top, is singularly beautiful. Its walls are nine feet nine inches thick, and three slender angular turrets issue from the top of it. The walls of the fortress are seven feet nine inches thick, and have within their thickness a very convenient gallery, with narrow openings for the discharge of arrows. In a little dark room on the eagle tower, which is about 12 feet by 8, Queen Eleanor brought forth the first Prince of Wales of the English line.

The town of Caernarvon, which is neat and regular, was formerly included within its present walls, but the suburbs are now larger than the town. The houses are well built, and the streets, which though narrow and confined, are clean, and are all at right angles, corresponding with the gates. The hot and cold baths, built by the late Earl of Uxbridge, have increased the number of gay invalids who visit this place in the summer season. Along the banks of the Menai, and without the walls, there is a delightful promenade, which commands a fine view, and extends from the quarry to the north end of the walls. The church of Caernarvon, which is situated about half a mile to the south east of the town, is in the parish of Llan-Beblic. The chapel of ease stands in the north west corner of the town, and the service is always performed there in English, while at Llan-Beblic it is performed in Welsh. The business of the county is transacted in the room over the eastern gateway, which was formerly used as a custom-house, for which a building has been erected within the walls. There is also at Caernarvon an extensive bowling green.

At a small distance from Caernarvon castle, near the steep bank of the Seiont, is a Roman fort. The walls, which are pretty entire on two sides, are 10 feet 8 inches high, and 6 feet thick; one of them is 7/4 yards long, and the other 6/. Along the walls are three parallel lines of round holes, not three inches in diameter, and nicely plastered within. There are in the end of the wall similar holes, which appear to run through it lengthwise. The foundation of a tower appears near the corner of one of the walls.

"This very curious piece of antiquity," says Mr. Pennant, "is at present most shamefully disfigured by walls and other buildings, insomuch, that I fear my description will in a manner become unintelligible."

Though Caernarvon has no manufactory, yet it carries on a tolerable trade with London, Bristol, Liverpool, and Ireland. Vessels of near seven hundred tons can ride in safety in the harbour, but the entrance to the port is beset with extensive sand banks. The articles imported, which are considerably less than the exports, consist chiefly of Irish cloth, fine wool, hides, tallow, and groceries. Slates, to the annual amount of 50,000, are exported to London, Bristol, and Liverpool. Copper ore from Llanberis, and the Paris mount, is shipped to Swansea; and flannel webs, stockings, and an ochre found in Anglesea, are exported to America and the West Indies. Number of houses 609. Population 5686; of whom 400 were returned as employed in trade and manufactures. See particularly Pennant's Tour through Wales, Lond. 1810, vol. ii. p. 409; and Evan's Tour through South Wales. (π)

CAERNARVONSHIRE, one of the counties of North Wales, is bounded by the sea on all sides except the east, where it borders upon Denbighshire, and a small part of the south, where it is in contact with the county of Merioneth. This county is the most mountainous in Wales, and exhibits all the sublimity and rugged grandeur which is peculiar to Alpine regions. The celebrated mountain of Snowdon, and a number of subordinate hills, with their craggy summits, deep dells, moors, chasms, and lakes, occupy the central part of the county, and are connected with another chain of hills, which extend across the county in a north west direction, from Aberconway to the sea at Aberdaron. The mountains between Caernarvon and Conway appear from the shore of Anglesea to rise in three different ranges. The lower valleys and the bases of these mountains are generally temperate and fertile. The second range affords pasture and fuel, while the highest range is destitute of vegetation, and is covered with snow during a great part of the year. The vale of Conway, which terminates at the town of Aberconway, extends about twenty miles. It gradually widens to about a mile in breadth, and its beauty increases particularly in the neighbourhood of Llanrwst, where it is formed into the finest meadows. The declivities of the
hills are well cultivated, and the eastern side of the valley, which is in Denbighshire, consists of low and broken hills, variegated with corn-fields, grass, and pasturage.

The principal rivers of this county are the Conway and the Seiont. The Conway has its source in a lake, at the point where the counties of Caernarvon, Denbigh, and Merioneth meet. It runs in a northern direction, skirting the east side of the county, and after a course of 24 miles it empties itself into the Irish Sea. It is navigable for about 12 miles from its mouth. The Seiont springs from a lake called Llynpris, among the hills about Snowdon, and running westward, discharges itself into the Menai Straits at Caernarvon.

The air of this county is cold and piercing. The extremities of the county near the sea are, however, fertile and populous, and yield fine barley in abundance. Between the hills there are many fruitful and pleasant vallies, which form a fine contrast with the dreary wastes which surround them. All the mountains of Caernarvonshire, and some of the low grounds on the western side, are commons. Sheep are pastured on the mountains, and black cattle on the lower grounds; and it is an annual custom among the farmers to fix the number of sheep which each shall send to the mountains. This privilege is sometimes sold by individuals for 4d. a head from May till Michaelmas. "The sheep," says Mr Pennant, "which during summer keep very high in the mountains, are followed by their owners with their families, who reside in that season in hafodtai, or summer dairyhouses, as the farmers in the Swiss Alps do in their senes. These houses consist of a long low room, with a hole at one end to let out the smoke from the fire, which is made beneath. Their furniture is very simple; stones are the substitutes of stools, and the beds are of hay, ranged along the sides. They manufacture their own clothes, and dye them with the lichen onphaloides, and parietinus, collected from the rocks. During summer, the men pass their time either in harvest work, or in tending their herds; the women in milking, or in making butter and cheese."

The preceding account, which must have been true in the time of Pennant, is contradicted by Mr Kay in his General View of the Agriculture of North Wales. He denies that the families live in the mountains. The wethers, according to him, are only sent up, and the ewes with their lambs are kept in the low grounds. When the lambs are weaned, the ewes are milked about two months, and the milk being mixed with that of the cows, is employed in making cheese. From the hundred of Llwyn, which is in general flat, and interspersed with isolated rocky hills, oats, barley, butter, and cheese, are exported, and about three thousand black cattle were annually sold.

The immense extent of land between the counties of Caernarvon and Merioneth, called the Traeth Mawr, consisting of about 3500 acres, and forming the bottom of the Bay of Cardigan, was granted by the crown in 1807 to William Madocks, Esq., for the purpose of recovering it from the sea. This enterprising gentleman had, in August 1809, completed 1000 yards of an embankment, composed of rock and soil, and about 12 yards broad at the top. It is prevented from sinking in the sand by a thick kind of matting made with rushes, and secured by stakes. The water, which flows from the mountains about Snowdon, is to be discharged by means of five flood-gates, each fifteen feet high.†

The rocks, which compose the higher part of the chain that extends from Aberconwy to the sea at Aherdaron, are chiefly porphyry, granite, and granitel of Kirwan. The lower rocks are principally hornblende, schiller spar, loadstone, mica slate, clay slate, mixtures of quartz, feldspar, and mica, with clay slate in all its varieties. On the west side of this range are a number of basaltic columns, on a bed of hornstone or chert, and in the fissures are found cubic pyrites, and various other minerals. At Nant-Francon are the slate quarries of Lord Penrhyn, who has constructed admirable railways, and effected a number of valuable improvements. By means of an inclined plane, and a proper apparatus on the top of an eminence, about 20 sledges are drawn up and let down at once, and when they reach the level, two horses are sufficiently able to draw them to the adjoining quay on the Menai, called Port Penrhyn. This railway cost L.170,000, and the real profits of the slate quarries, to which it is attached, amount to about L.15,000 per annum. Above L.35,000 worth of slates are annually exported from the county. A little to the eastward of Pwllhely, there is a vein of yellow ochre; near Penrhyn also there is found a blackish heavy hard stone, which is used instead of brass for supporting the pivots and gudgeons of light machinery; and towards Bardseye sound is found a beautiful red stone, which will bear a fine polish. Near Cwm Idwal, there is a quarry celebrated for excellent homes, of which great quantities are annually sent to London. Some lead mines have been discovered near Gweddir; and in the promontory of Penrhyn duo, one of the points of the Tudwal's bay, there have been several adventures for lead ore. Many attempts have been made to drain the mines by an engine, but the expense has always been too great. Copper mines have been wrought in various parts of the Snowdon mountains, but particularly in the neighbourhood of Llanberis. About 200 yards above the Lake Ffymnonlas are the copper mines of Sir Robert Williams, Bart., the produce of which is carried in bags for nearly a mile on the backs of men, and over one of the highest ridges of Snowdon, till it is brought to a road accessible to sledges. At Drws y Coed were some years ago considerable adventures for copper of the pyrites kind, and thin lamine of the native metal were sometimes found in the rocks.

The principal mountains in this county are Snowdon† and Penmaen-Maur. The height of Snowdon, above the level of the sea, at Caernarvon bay, is generally estimated at 3567 or 3600 feet. About 62 miles to the W.S.W. from Aberconway, the tremen-

† A full account of this plan will be found in a Note by the Editor of Pennant's Tours in Wales, vol. ii. p. 364. London, 1810.

† See the article Snowdon, for a full account of this celebrated mountain.
The lake called Llyn y Dywarchen, or the Lake of the Sod, has been celebrated, by Gyraldus for its floating island. This island is of an irregular form, and about nine yards long. It is frequently moved by the wind; and when driven to the shore, cattle are often surprised upon it, and carried into the lake. In the winter of 1674, a pestential vapour, like a weak blue flame, continued to rise, for a fortnight or three weeks, out of a marshy sandy tract called Morfa Bychan; and crossed over a channel of eight miles to Harlech in Pembrokeshire. It set fire on that side to 16 ricks of hay and two barns, and infected the grass in such a manner, that numbers of cattle, horses, sheep, and goats, died.†

Considerable quantities of fish, but particularly herrings, are caught on the shores of this county, and lobsters and oysters are found in great abundance. Large pearls are found in black muscles, which are numerous in the river Conway.

On the coast of Caernarvon are two islands, called St Cadwal, which are inhabited only by sheep, rabbits, and puffins. The island of Bardsey, which lies about three leagues to the west of Aberdaron, is about two miles in circumference, and was once famous for its convent, which was the resort of numerous monks.

This county is about 45 miles long, 13 broad, and 150 in circuit. It contains about 310,000 acres, of which 100,000 are in a state of cultivation, or pastureage, while 100,000 are unfit for culture. It contains 8804 inhabited houses, and 41,521 inhabitants; 19,536 males, and 21,985 females, of whom 4234 were returned as employed in trades, and 12,808 in agriculture. It contains one city, viz. Bangor, the county town Caernarvon, 10 hundreds, 5 market-towns, and 71 parishes. The amount of the assessments, under the property-tax for 1806, was L. 191,800, and the money raised for the poor in 1803, was L. 9137, being at the rate of 4s. 0½d. in the pound. See Description of England and Wales, vol. i. p. 197; Pennant's Tours, vol. ii. p. 299, &c.; Kay's View of the Agriculture of North Wales; Evan's Tour through North Wales; A Sketch of the History of Caernarvonshire; Aikin's Journal of a Tour through North Wales, and A Tour in Wales, and through several of the Counties of England, &c. in 1803; in Phillip's Collection of Voyages, &c. vol. iv. p. 119. &c. (π)

Caerwent, the Pentiaritam of the Romans. The ancient fortress, for which alone it is deserving of notice, is of an oblong form, rounded at the angles, and is 505 yards long by 390. Each corner corresponds with the cardinal points; and at the south-west side there are three pentagonal bastions. The rampart, which is nearly a mile in circuit, may still be traced, and it is surrounded in most places by a deep fosse. About 50 years ago, a curious tessellated pavement was discovered. It is 21 feet long, and 18 broad, and has a border of variegated stones. Columns and coins are frequently found, when the ground is turned up by the plough. Number of houses, 55. Population, 329. See Evan's Tour through South Wales; Barber's Tour through South Wales; and Coxe's Tour in Monmouthshire.

(π)

Caerwys, the name of a small town of Flintshire, which is mouldering away with age. It stands on a rising ground, and consists of four spacious streets, crossing each other at right angles, and corresponding to the points of the compass. Several Roman copper coins have been found here; and a stone, four feet six inches high, and three inches broad, was discovered in an upright position, with the inscription - Hic: jacit mulierbo - - - - ohibit. This curious relic, which was used as a gate-post, has been lately removed to the garden at Downing.

Multitudes of tumuli are scattered over the neighbourhood; and Pennant seems to think that the preceding inscription refers to a heroine, who fell in the field of battle. The derivation of Caerwys, from Caer, a city, and Gws, a summons, shews that it was once a seat of judicature for this part of Wales. It had its town-hall and its jail, and continued to be the place of judicature till the middle of the 17th century, when the courts were removed to Flint. Caerwys is famous for its eisteddfod, or session of bards and minstrels, which was held here for many centuries. A silver harp was annually given to the best bard or musician, but this custom was discontinued after the eisteddfod of 1568, held by a commission from Queen Elizabeth. In 1798, this custom was resumed, but we do not know if it has been continued. Caerwys had formerly the most considerable fairs in the county for cattle, sheep, and horses; but these have almost entirely failed, since the increase of Holywell. Number of houses, 138. Population, 773. See Aikin's Tour in Wales; Evan's Cambrian Itinerary; Pennant's Tours, vol. ii. p. 77—105, where a complete account of the Eisteddfod will be found; and Powell's History of Wales. Cesalpinia, a genus of plants of the class Decandria, and order Monogynia. See Botany, p. 209.

Cesare, Caius Julius, the first Roman emperor, is one of the most extraordinary characters that have appeared in the history of the world. Caesar was born of an illustrious family, though his immediate ancestors had been but little distinguished. The Julian family laid claim to high antiquity; and the refined flatterers, who were patronized by the liberality of Augustus, have consecrated these pretensions by the elegant productions of their genius, and taught
We know little of the parents of Caesar; all that we know respecting his father is, that he dropped down dead one morning when he was putting on his shoes; and of his mother Aurelia, it is said, that she was a matron of noble family, and great propriety of manners; and that she bestowed the utmost attention on the education of her son. The youth of Caesar seemed, to ordinary observers, to afford no indications of his future greatness; it was spent in turbulence, pro-
fusion, and profligacy. He was notorious for the most unmanly and disgusting debauchery; and all the splendours which afterwards surrounded his name and his family, have not been able to screen his vices from the lash of satire. With the habits of a rake and a coxcomb, few people apprehended any danger to the republic from his exertions; even Cicero, after he began to entertain some suspicions of his intentions, was deceived by these appearances, and said, that he could not conceive the state had anything to fear from a man so finical in his dress; and so much afraid of deranging the economy of his hair, that he scratched his head with one finger.

He had given early proofs of aspiring ambition; and his connections at first were such, as to promise the attainment of his object with little trouble. Marius was married to his aunt; and, to strengthen his interest with that party, he himself married Cornelia, the daughter of Cince: Through the influence of these powerful leaders, he was chosen Flamen Diaulis, or priest of Jupiter, when he was only about seventeen years of age. On the ruin of this party, Caesar became an object of jealousy to Sylla, who had sufficient penetration, even at that early period, to appreciate his character. When those around the dictator represented Caesar as too insignificant to excite any apprehensions, he replied, with a kind of prophetic sagacity, that he saw many Mariuses in that dissolute youth. Indeed, he gave at that time a proof of intrepidity, unexampled in that reign of terror; he had the boldness to resist the command of Sylla to divorce his wife, by means of whom he was so closely connected with the opposite faction; and chose to go into a voluntary exile, rather than purchase security by a dishonourable sacrifice, or yield obedience to a tyrant's will.

As Caesar seldom did any thing which had not a tendency directly or indirectly to the great object of his life—his advancement to power,—it is probable, that his opposition to the will of Sylla, is to be set down to the score of his ambition, rather than ascribed to conjugal fidelity. He married Cornelia for political purposes, by breaking his engagements with another; and he would have parted with her with the same facility, could his views have been promoted by the measure. But it seems to have been his wish to appear as a martyr to the cause of Marius, which had always been popular with the multitude, through whose means he intended to climb to power.

Finding it expedient to leave Rome, which was at that time entirely under the dominion of his enemies, he resolved to prosecute those studies, for which he was so eminently qualified by nature, and which were absolutely necessary for every one who wished to make a figure in the state. In that age of Rome, scarcely any man could hope for influence, unless he had riches to bribe the unprincipled, or eloquence to protect the defenceless. By the judicious application of the latter quality, Cicero had raised himself to the highest honours of the state; but Caesar, who looked far beyond the legitimate honours which satisfied Cicero, wished to combine in his own person every qualification which could smooth the way to absolute authority. He saw that eloquence was necessary to give eclat to wealth, or to justify its misapplication. Crassus, the richest man in Rome, never had been respected, because he was known to be of sordid habits and mean capacity; and though he had ambition to aspire to absolute power, and money sufficient to have bought it, yet, as wanted abilities to wield such a cumbersome and dangerous instrument, he never became an object of jealousy to the state. Unfortunately, all these qualities were combined in Caesar: his ambition knew no bounds; his wealth, which was considerable, was most profusely lavished on the needy and undeserving; whilst his abilities ranked him with the first characters that Rome or the world ever produced.

To improve his eloquence, he resolved to spend the time of his retreat from Rome, under Appollonius Molao, a celebrated rhetorician at Rhodes, who had also been the master of Cicero; and who thus had the honour of having for his pupils two of the most extraordinary men who have figured on the theatre of the world. On his way to Rhodes, he was taken by pirates, with whom he lived upwards of a month, till he could procure money to purchase his freedom. During this interval we are told by Plutarch, that he lived very much at his ease, engaging in all the exercises and diversions of the pirates, delivering orations to them, and calling them brutes and barbarians, when they did not appreciate the merit of his compositions. He also threatened to crucify them all, as soon as he should obtain his liberty: the pirates laughed at these threats, and considered him as a pleasant fellow: it was not long, however, before he had an opportunity of carrying them into effect. He manned a few vessels in the port of Miletus, and attacked the pirates whilst they were lying at anchor in perfect security. He took the greater part of them prisoners, and immediately applied to Junius Silanus, pro-consul of Bithynia, for an order for their execution; this being refused, he hastened to the place where he had left them, and had them all nailed to the cross, before instructions could arrive to prevent it.

After the fears excited by the proscription were removed, and the vanquished Marian party began to think of again lifting its head, Caesar was earnestly solicited by his friends to return to Rome, that the party might be supported by his known talents and intrepidity. He began his political career in the way common amongst young patriots at Rome, as well as in other countries, by professing great zeal for the purity of the administration: and by publicly impeaching some persons of great influence, and high
in authority. Though he was baffled in several of these attempts, he did not fail to gain his end, by thus securing the admiration and confidence of the multitude. His purse was always open to the indigent; his eloquence and his patronage were at the service of the most profligate: his only object was to gain devoted partisans, and he was nowise scrupulous about the means employed to obtain them. He soon had a proof of the favour of the people, in carrying the office of tribune of the soldiers, in opposition to a powerful competitor; and, shortly after, it was manifested in a more decided manner, when he pronounced the funeral oration of his aunt Julia, the wife of Marius. On this occasion, he had the hardiness to produce the images of Marius, which had not been seen during the administration of Sylla and the prevalence of his party, as all of the Marian faction had been declared to be enemies to the state. A great clamour was raised against Caesar by the patrician party, whose authority had been established by Sylla; and it is probable that he might have suffered for this indiscretion, had he not been supported by the unanimous voice of the people, whose acclamations and avowed admiration showed his enemies that it would be vain to attempt anything against him.

He continued to cultivate the favour of the people by acts of unbounded munificence; and those who had begun to apprehend danger from his designs, now dismissed their fears, by anticipating the total ruin of his fortune. His expenditure during his zdileship, in the exhibition of games and public entertainments, exceeded any thing that had been seen at Rome on similar occasions. He produced three hundred and twenty pair of gladiators, to slaughter each other for public amusement; a kind of entertainment of which the Roman people were distractedly fond, and which sufficiently marks their brutal and ferocious character. In the midst of these popular exhibitions, he ventured to give a still more daring and decided proof of his contempt for the aristocratical party, than any which he had hitherto displayed. He caused images of Marius to be made of the most costly materials, and most exquisite workmanship, together with a representation of his victories over the Cimbri, and in one night placed them in the capital. Nothing could exceed the public astonishment, when they were next day exhibited to view. The senate was assembled on the occasion; and Lu
tatius Catalus, one of the principal men of Rome, publicly accused Caesar of a design against the state, declaring, that no longer content with sapping the foundation of the commonwealth, he now attacked it by open force. But Caesar’s abilities, proficiency, and intrepidity, had secured him so many friends, even in the senate, that he was publicly acquitted.

After this success, he ventured to measure his strength with the principal men of Rome. The office of Pontifex Maximus falling vacant by the death of Metellus, Lutatius Catalus, prince of the senate, and Servilius Isauricus, a man of high military repu-
tation, under whom Caesar had served his first campaign, declared themselves candidates. Caesar, though greatly inferior both in age and dignity, ventured, nevertheless, to enter the lists with these powerful competitors. He seems to have staked his prospects and his influence on the issue of this contest; for when his mother, on the day of election, expressed her anxiety, he declared, that she should that day either see him high priest, or an exile. Never was any election more keenly contested. It was a trial of strength between the patrician and popular parties; and the triumph of Caesar was so complete, as scarcely to leave any room for contest in future; for on tak-
ing the suffrages, he had more votes against them in their own tribes, than they were able to procure among all the other citizens. Sueton, in Cæsar, xiii.

The same year in which Caesar obtained the priesthood, Catiline planned his famous conspiracy, which has been so ably recorded by Sallust the historian, and which procured so much eclat to Cicero, from the vigour which he manifested in its suppression. Caesar was not only suspected, but publicly accused of being privy to this conspiracy; and it perhaps would be difficult to defend him from the charge; he had probably more sense than to join his flourishing fortunes with such a desperate adventurer as Catiline; but it is as probable that he would rejoice in any communion, perhaps even in the subversion of the state, as this would afford a proper field for the exhibition of his talents, and for procuring that absolute ascendency at which he uniformly aimed. His speech, recommending lenity to the conspirators, was inconsiderate, considering the suspicions which were attached to him, and had nearly been attended with fatal consequences to himself: for Cato’s speech in opposition to the sentiments of Caesar, and in which, as Plutarch informs us, he expressed his suspicions of his principles, had produced such a spirit of enthusi-
asm on the minds of all who heard it, that the Roman knights, who had assembled as a voluntary guard around the person of Cicero, rushed upon Caesar with their swords, as he left the senate-house, and looking to the consul for a nod of approbation, would have instantly dispatched him, had Cicero given his assent. At this critical moment, Cicero interposing, and covering him with his gown, rescued him from his dangerous situation.

Caesar was next, in the regular gradation of office, advanced to the praetorship, and during his administra-
tion of this department, the commonwealth enjoyed a short respite from his intrigues. A disagreeable occurrence, however, happened in his family; which seemed to give him but very little uneasiness. Publius Clodius, a young Patrician, of high birth and ample fortune, but of the most abandoned and profligate character, had entertained a criminal passion for Pompeia, Caesar’s wife, which she did not discourage; but they had no proper opportunity of an interview, on account of the vigilance of Caesar’s mother. It was therefore agreed, that Clodius should be intro-
duced in woman’s clothes, during the celebration of

* Credos, ino eio nullum bellum tamen cladem vestigatumque generi humano intulisse, quam haud ad voluptatem ludos. Mentor et non annus aliisque mensis Europæo stite sic cuimulat etiam recensit. Lipsiam, Saturn. l. 12.
the mysteries of the Bona Dea, to which no male creature was admitted. One maid only was in the secret, but she happening to be out of the way when Clodius entered, he was discovered by his voice, and with difficulty escaped from the fury of the enraged matrons. This story made a great noise at the time; but Caesar took it very coolly: he said, that he did not believe it; but he nevertheless divorced Pompeia, alleging as the reason, not her guilt, but the sacredness of his honour, and saying, that Caesar’s wife ought not even to be suspected. The truth is, he was anxious to conciliate Clodius, who was the most popular and the most furious demagogue that ever appeared in Rome, and whose assistance he saw must be of infinite service to him.

On the expiry of his office as praetor, Caesar obtained his first military command, and was appointed, by lot, to the government of Lusitania, comprehending nearly the modern Portugal and Andalusia. He had so completely involved himself by his boundless profusion, that his creditors interfered, and prevented his departure. On this occasion, Crassus stood forward as his surety, for considerably more than a million of our money, (Bis millies et quingenies.) Caesar made a joke of this circumstance, and said that he wanted this sum to be worth just nothing at all. In modern times no man could think of repairing such a ruined fortune; yet Caesar soon found means of repaying the sum, and of undertaking, at his own expense, the most magnificent public works that ever had been seen at Rome. This is easily accounted for, when we consider that extensive provinces were entirely at the mercy of their governors, who could make whatever exactions they pleased; and though they were often accused of peculation, yet it was never till they had amassed such a fortune as to render them formidable; and, in general, completely to screen them from punishment. In passing the Alps, on his way to Spain, one of his attendants, pointing to a small village, said, Here too, it is probable, there are parties, and contests for power. To which Caesar replied, “I would rather be the first man here, than the second man in Rome.”

In his government in Spain he contrived to quarrel with the natives, that he might have an opportunity of bringing into view those military talents which he possessed in such an eminent degree; and his success was such, that on his return to Rome, he publicly claimed a triumph. Unfortunately, however, he had two objects in view, which could not easily be reconciled; he solicited at the same time a triumph, and the consulsip: to obtain the first object, it was necessary, according to immemorial custom, that he should remain without the city, till the sentence of the senate be known; and there had been instances of commanders waiting for months in that situation, in hopes of being able to enter the city in triumph. On the other hand, in order to obtain the consulsip, it was necessary that the candidate should be within the city, to solicit in person the suffrages of the people. Caesar at first tried to get this law dispensed with, but as Cato violently opposed the innovation, he resigned his pretensions to the triumph, that he might enjoy the more substantial honours of the consulship.

Caesar, knowing well how much his character and designs were now suspected, had recourse to an expedient, which, whilst it paved the way for him to the honour which he desired, sealed, at the same time, the subversion of the commonwealth. The two most considerable men in Rome at that time were Pompey and Crassus; the one for his popularity and power, the other for his enormous wealth and extensive patronage, which gave him great influence in the state. Between these two, there had long subsisted such a jealousy as generally takes place between persons who have the same object in view, which both cannot obtain. Caesar paid court to both: and on the present occasion, he showed them the advantage of union; convinced them that they might obtain whatever they pleased, by joining their influence; but that certain disappointment would be the consequence of disagreement. They easily perceived the justice of this reasoning, and assuming the author of the measure as their associate in their scheme of appropriating to themselves the power of the state, they entered into that famous league, commonly known by the name of the first Triumvirate. By the aid of two such powerful friends, Caesar secured his election; the Patrician party, however, prevailed so far as to get another popular candidate excluded, and to introduce Bibulus, to whom they looked as a check on Caesar. Bibulus, it appears, was a worthy character, but destitute of sufficient energy to contend with such a colleague as Caesar. He stood out, however, till his life was almost in danger from popular violence, and then he confined himself to his house; contenting himself with publishing edicts in opposition to the measures of his colleague. So inefficient, however, were all his measures, that it was a common joke to designate the period of his consulship, by saying, Julio et Cassare consulibus.

Caesar, to secure still further the affections of the people, proposed and carried an Agrarian law, by which he was to provide for twenty thousand poor citizens. This was the usual way in which factious demagogues courted popular favour, and was always strenuously opposed by the senate. Indeed, no plan could be conceived more injurious to the state, than that which proposed a premium to idleness. It was not the law, however, which the senate opposed so much on the present occasion, as the influence of the man who proposed it. “It is not this law which I dread,” said Cato, “but the reward expected for obtaining it.” This stern senator, therefore, resolved to brace the odium of the people, and to oppose, to the utmost the measures of their favourite. For this purpose he determined to avail himself of his privilege of speaking in the senate without interruption, that so he might exhaust the whole time of the sitting, and prevent them from coming to any conclusion. Caesar suspecting his design, and seeing no other way of preventing it, ordered him into custody. This was a very unguarded measure, and he soon...
found that he had carried his audacity too far: for the whole senate rose in a tumult, and prepared to leave the house. "Whether are you going?" said Caesar to Petreius, who was moving from his side. "I go," said he, "into confinement with Cato: a prison with him is preferable to a place in the senate with you." Caesar had counted on their want of decision; and was disappointed when he saw the spirit which they manifested on this occasion. Cato perceiving his embarrassment, resolved that he should have the full odium of the measure; and therefore delivered himself without reluctance into the hands of the lictors. Caesar soon recovered himself, and sent a tribute of his own party, with secret instructions to rescue the prisoner.

But the most odious of all his acts, during his consulship, was the purpose which he formed of ruining Cicero, by recording the views of Clodius. It was no obstacle that this libertine had been accused of dishonouring his bed; he was anxious to destroy the influence of Cicero, who had publicly lamented the situation of the commonwealth, in being subjected to a cabal, which governed by violence and in contempt of law. Caesar was highly offended, and resolved to get rid of a person who was so capable of countering his views. Clodius had long been laboured to accomplish the destruction of the same illustrious person; and at that time endeavouring to get himself adopted into a plebian family, that so he might be qualified to be elected tribune of the people. He knew, that if he could accomplish this object, he would be able to carry whatever measure he pleased. There were, however, considerable obstacles in the way, and Clodius could not obtain the ratification of his adoption in the assembly of the Curiae; but this act of ratification was passed on the very day on which Caesar took offence at Cicero. The issue is well known: this father of Roman eloquence, and not long before the preserver of the state, was sacrificed to the hatred and ambition of two unprincipled individuals, and forced to retire, for a time, from a country no longer worthy of his virtues.

With these transactions, Caesar's consulship drew to a close. He ratified his treaty with Pompey, by giving him his daughter Julia in marriage; he gratified the vanity and avarice of Crassus, by entrusting him with a lucrative commission; and in one way or other he tied up the hands of every man who had power to hurt him. He himself married the daughter of Piso, who was next year to succeed to the consulship, and by this alliance secured him in his interest. On hearing of these political marriages, Cato exclaimed, "Provinces and kingdoms are made the dowries of women; and the empire itself an appendage of female prostitution."

Though Caesar had advanced so far and so successfully, much yet remained to be done, before he could openly seize the government of the state. The power and popularity of Pompey were still enormous; and Caesar saw that nothing could be effected without a strong military force. Such a force, however, could not be maintained within Italy; for the senate, with a well-grounded jealousy, had prohibited any military station within that country. Caesar therefore cast his eye on Cisalpine Gaul, which he saw would answer all his purposes, from its vicinity to Rome. The tribune Vatinius, accordingly, who was completely devoted to the interests of Caesar, upon a report that the Helvetii were likely to cause some disturbance on the frontiers of Gaul, moved the people, that, by virtue of their supreme power, they should nominate Caesar as Proconsul of Cisalpine Gaul and Illyricum, for five years, with an army of three legions. This was contrary to all law; the allotment of the provinces had always remained with the senate, and no appointment was made for more than one year; unless it was renewed at the end of that term, it virtually expired. This, however, did not prevent the people from granting this illegal appointment to Caesar. The senatorial party were greatly alarmed at this measure, and endeavoured to evade it by nominating Caesar superintendent of the public forests of the empire. Finding, however, that he was not to be driven from his purpose by such a weak artifice as this, they took different grounds, outstrip the people themselves in the liberality of their grants, and added Transalpine Gaul to the province already decreed to him by the people, with the addition of another legion. It is not easy to say whether this measure proceeded from fear or from policy: they either saw that it was in vain to oppose him, and therefore wished to make a merit with him for their concessions; or they hoped that the five years of his government would be completely taken up with the wars which they expected to arise beyond the Alps.

As it is our design to follow the political rather than the military career of this extraordinary adventurer, we shall not detain our readers with a detailed account of his eight campaigns in Gaul, nor of his two descents on Britain. He was not less ambitious of military fame, than desirous of unrivalled power; and all his campaigns were conducted with an ability, to which nothing but his own admirable Commentaries can do sufficient justice. He contrived even to give a colour of justice and humanity to his bloody operations in Gaul, by stating himself as the protector of the native inhabitants, against the invasions of the Helvetii and the Germans. His laurels were indeed deeply stained with blood; for his wars in Gaul cost not less than one million two hundred thousand lives. But this goes for nothing in the estimation of those who aspire to the title of conquerors. The Romans, in particular, were regardless of the justice of their wars, and the effusion of hostile blood; and we shall perhaps search in vain in their history for a just war, except when they were engaged in the defence of Italy. Caesar gained two very important objects by his wars in Gaul; a high military reputation, and an army devoted to his interests. He indeed omitted no means which could secure the attachment of his troops: he shared with them every danger; and they had such confidence in his skill, that they engaged with alacrity in whatever enterprise he thought proper to recommend. In the meantime he did not neglect his interest at Rome. He frequently spent the winter in Cisalpine Gaul, that he might the more easily communicate with his friends in Rome. Pompey and Crassus waited on him at Lucca, a town within his province, where they renewed their former association, and entered into an agreement respecting the partition of the empire. Pompey and Crassus were to stand for the consul-
Such was the general opinion respecting the dis-
agreement between these two powerful rivals; it was
considered as the immediate cause of the subversion
of the commonwealth; but Cato said that it was not
their disagreement, but their union, which had ruined
the state. It is certain, that both parties from this
period began to consult more invovledly their individ-
ual interests. Caesar now paid more than usual at-
tention to all intelligence from the city; and was at
the utmost pains to secure every person who could
be of service to him in the conflict which he saw ap-
proaching. He now paid particular court to Cic-
ero, who had been recalled from his banishment: he
knew well the weak side of this great man, and by
addressing his vanity, or as Cicero himself called it,
his love of glory, he hoped to secure his neutrality,
if not his active co-operation. For this purpose, he
consulted his taste with regard to the public build-
ings which he intended to erect at Rome; carried on
a close correspondence with him during his campaign
in Britain, and whilst chasing the painted savages in-
to their native woods, he read, criticised, and affected
to admire the poetry of Cicero.

Whilst things were in this situation, Rome was the
scene of the utmost confusion. Clodius had long, by
intrigue and violence, interrupted the operations of
the government, and being supported by the mob and
a body of armed gladiators, he set at defiance the
laws and the magistrates. Milo, a person of great
courage, and attached to the senatorial party, resol-
ved to combat him in his own way. For this pur-
pose, he also hired a band of gladiators, and prepared
to oppose force to force. Many sanguinary encoun-
ters took place in the midst of the city; and the

+ Florus expresses very neatly and very justly, the views of these different leaders in their original compact. "Si igitur
Cesaris dignitatem compararent, Crasso augmento, Pompei in rei publicae fucile consente."
Caesar. 199

giving up without a quarrel, all that any quarrel could extort.

Caesar's power and general conduct now began to excite serious apprehensions. The continual augmentation of troops in his province, his great military reputation, his insinuation, his unbounded liberality, his assiduity in excluding from power every one who could oppose his interests, were viewed with general alarm. When, therefore, the regular election of consuls took place, Marcellus, who had been elected along with Servius Sulpicius, made a motion in the senate, which hastened the crisis which every prudent man had long foreseen. In deliberating on the appointments in the provincial governments, he moved that the war in Gaul being finished, Caesar should be recalled; or if his friends insisted on his continuing in his command, that he should not be admitted on the list of candidates for the consulship, till he presented himself personally for this purpose.

This motion gave rise to long and violent debates. Many strong resolutions were carried in the senate, and as often defeated by the negative of the tribunes, who were always in the interests of Caesar. This aspiring adventurer had now this advantage on his side, that all the measures proposed in the senate against him, had the appearance of direct hostility and injustice, as they had for their object to reverse decrees which had lately been solemnly made in his favour, both by the senate and the people. Pompey perceiving this, affected to censure the violence with which it had been proposed to recall an officer legally appointed before the expiration of his term. Shortly after, however, he sufficiently disclosed his sentiments and feelings on the subject, by saying in the senate, that although he did not think that the proconsul of Gaul could be instantly recalled without injustice, yet that after the first of March, (this day having been specified in the senate,) he should have no difficulties on the subject. "But what," says one of the senators, "if Caesar still persist in demanding the consulship while he retains his province and his army?" "What," replied Pompey, "if my own child should offer me violence?"

These proceedings sufficiently pointed out to Caesar what part he was to act. After defeating the Gauls and the Germans in every attempt to regain their freedom, he endeavoured to conciliate their affections, that his hands might be free for a more important enterprise. He established a chain of military posts from one end of his province to the other, that his troops might be ready to act in any emergency, or in any direction; whilst he himself remained in the station most distant from Italy, with a view of increasing the hostility, and at the same time the security, of his enemies at Rome. He always affected the greatest moderation; and his friends at Rome were instructed to propose a compromise to the senate, sufficiently equitable in appearance: provided Pompey retired to his province, and Caesar were allowed to retain Cisalpine Gaul with two legions, they proposed in his name to disband the remainder of his army, and to resign the other part of his provinces. "Observe the dutiful citizen and good subject," said Cato, "how ready he is to quit the northern parts of Gaul, if you only put him in possession of Italy and the city: and how ready to accept of your voluntary submission, rather than employ your own army against you to enforce it."

The senate at last came to a vote on the following questions respecting the appointments of Caesar and Pompey. On the first question, Whether Caesar should disband his army? the Ayes were general throughout the house. The same question being put respecting Pompey, the Noes greatly prevailed. Mark Antony insisted that a third question should be put, viz. Whether both should dismiss their armies? On this question, three hundred and seventy Ayes appeared against twenty-two Noes.

 Shortly after this, Caesar received an order from the senate to detach a legion from his army to be employed in the Parthian war, in which Crassus had fallen, with the greater part of his army, some time before; and likewise to restore the legion which he had borrowed from Pompey: With both these requisitions he complied with seeming cheerfulness. In dismissing the soldiers of Pompey, he was, under pretence of gratitude for former services, most lavish in his caresses and his thanks; and, as an earnest of future favours, gave each man a gratuity of about L. 5 of our money. Thus, whilst he parted with the men, he retained their affections; and sent them as a very dubious accession of strength to his enemy.

An immediate rupture was now unavoidable; and the consul Marcellus, the third of that name in the succession of consuls, being thwarted in all his measures by the tribunes, declared, in a fit of impatience, that he would put the exercise of his power into hands more likely to make it respected; and upon this he went and presented his sword to Pompey, bidding him employ it in the defence of his country.

Caesar now left the northern parts of Gaul, and took up his residence at Ravenna, the nearest point of his province to Italy: From this place he sent a letter to the senate, not couched in the most respectful terms, and complaining of their injustice in robbing him of the honours decreed to him by the Roman people. This letter was deemed an insult by the senate; and a resolution was framed, ordering Caesar to dismiss his troops by a certain day, and, in case of disobedience, declaring him an enemy to the state. To this resolution the tribunes interposed their negative. Upon this it was moved, that the senate should put on mourning, as in a case of public calamity; this the tribunes also forbade. The members, however, of their own accord, appeared at their next meeting in mourning, and gave it in charge to the consuls, in conjunction with Pompey, to provide, by every means in their power, for the safety of the state.

The tribunes, who had occasioned this measure, affecting to apprehend danger to their persons, disguised themselves in the habits of slaves, and, toge-
Cæsar.  

Cæsar, upon hearing of these measures, called out his troops then at Ravenna, enumerated the injuries which he had received, depicted, in glowing colours, the injustice of his enemies, and exhorted his soldiers to support the honour of their general, under whom they had so long, so gloriously, and so successfully served their country. He was answered by a general acclamation from the ranks, that they were ready to avenge the injuries done to their general, and to the tribunes of the people. At this time Cæsar had but a small force on the side of Italy, and it was not supposed that he was in a situation immediately to commence hostile operations; and, so long as he did not bring any alarming force towards Rome, his enemies continued secure, and made no effectual provision to resist him; so that the seeming neglect with which he suffered himself to be taken, was probably a preconcerted measure, and the best preparation he could make for beginning the war. He had most to apprehend from Pompey's legions in Spain; and he had made the best disposition against them, by placing the strength of his army between the Pyrenees and the Alps.

On the very day in which he harangued his soldiers at Ravenna, he passed the Rubicon, the boundary between his province and Italy, by which he virtually declared war against the state. Plutarch, and others, have given us an account of the scruples and agitations which disturbed his mind on the passage of this famous stream; he himself makes no mention of any such scruples in recording this event, and, indeed, it is very unlikely that he should have had any, after the lengths he had gone. He who had held it as a maxim, *Nihil esse republicam, appellatorem modo, sine corpore et specie*; and who had overleapt the most sacred laws which had been devised for the defence of the state, was not likely to feel compunction on crossing a trifling stream.

He immediately seized Ariminum, the first fortified town beyond the Rubicon. Here he again addressed his soldiers; presenting the tribunes to them in the same dress in which they had fled from Rome, "See," said he, "to what extremities persons vested with the sacred office of tribunes are reduced, for having supported their friends, and pleaded the cause of an injured army." Some advances were now made by Pompey, probably merely with the view of gaining time; these Cæsar knew well how to evade. Accordingly he was continually making offers of peace, that he might throw the odium of the war upon his enemies; whilst, at the same time, he was pushing his military operations with the utmost vigour. As fast as troops could march, he seized Pisaurnum, Fausnum, Auxinium, Ancona, and every other place which was necessary to give him the command of the country, or to open his way to Rome.

Pompey appears to have been quite unprepared for these decisive measures of Cæsar; some of the senators sarcastically desired him to *stamp with his foot*, as he had formerly boasted that he could by this means raise an army to oppose Cæsar. He now informed the senate of the necessity of leaving Rome; and, though he did not avow his intentions, he had resolved on leaving Italy. His retreat damped the courage and the zeal of his followers; and, as soldiers seldom voluntarily choose the losing side, even the troops who had been raised to oppose Cæsar deserted to him, and greatly augmented his army. Rome was now open to him, but he esteemed the possession of it of no moment, till he should decide who was to be permanent master. He therefore marched in search of Pompey, who fled before him to Brundisium: he immediately invested the place, which Pompey defended only till he got his troops transported to Dyrrachium, on the other side of the gulf.

Cæsar having made himself master of Italy in sixty days, now directed his course to Rome. He every where made the greatest ostentation of clemency, and gradually dissipated the fears which were generally entertained of another proscription. He found little, however, at Rome to gratify his feelings; the consuls and most respectable part of the senate had followed Pompey; and there was a general air of distrust and desolation. He had not even resolution to harangue the people, as he had once proposed; he avoided public view; and, having spent only a few days in Rome, he set out for Spain, where he expected the weight of the war, after having stripped the public treasury of all the money which it contained. He was for a considerable time vigorously resisted in Spain by Afranius and Petreus, Pompey's lieutenants: with his usual ability and success, however, he at last prevailed, and the whole army was forced to surrender. With his usual policy he treated them with the greatest clemency, and gave them liberty to retire to whatever place they pleased. After the reduction of Spain, whilst he was engaged in the siege of Marseilles, he received intelligence, that his party at Rome had procured a decree of the people, vesting him with the power of dictator. He hastened to Rome to take possession of his new dignity, which was of some consequence to him in his present circumstances, as he could then plead the appearance of legal authority for his proceedings. He staid only eleven days in Rome; and then marched after Pompey, who had collected a great force in Macedonia. He landed on the coast of Epirus, before Pompey had any notice of his approach. The latter, however, having the command of the sea, by means of his superior fleet, took possession of Dyrrachium, where he could easily be supplied with provisions. Cæsar, with an inferior army, attempted to inclose him in his camp, and cut off all communication with the land; but, after incredible exertions of labour and of valour to accomplish this object, he was baffled, and in fact routed; and had Pompey known how to improve the advantage he had gained, there must then have been an end of Cæsar's fortunes. But Pompey, from the high character of Cæsar's men for steadiness and discipline, mistook their flight for a rout, and did not dare to pursue them. "This day," said Cæsar, "victory would have declared for the enemy, if they had had a general who knew how to conquer." He was so much distressed for want of provisions, that he was under the necessity of imme-
diately retiring: Pompey pressed close upon his rear; but it was evidently the interest of the latter to avoid a battle, and not to give his enemy a chance of retrieving the advantages he had lost; and had Pompey been allowed to follow his own inclination, this was the plan which he intended to adopt; but his troops, flushed with their late victory, were conti-

nually demanding to be led against the enemy; and Cato alone, of all the officers and senators who ac-

accompanied him, seconded his plan for delay. Whilst

his army was in this disposition, he came up with his enemy, who was encamped at Pharsalia. Cesar did every thing in his power to provoke an engagement; but despairing at last of accomplishing his purpose, he was on the point of decamping, and had actually given the signal to march, when it was observed that Pompey’s army had advanced considerably farther than usual. Cesar exclaimed, “the time we have so long wished for is come; let us see how we are to acquit ourselves;” and immediately gave the signal

for battle. The result was the complete defeat of Pompey’s army, with the loss of 15,000 killed, and 24,000 prisoners, most of whom enlisted in the army of Cesar, (see PHARSALIA). Pompey fled almost alone into Egypt, having some claim on the gratitude of the Egyptian court. Cato, with the fleet and the

remains of the army, steered his course for the Roman province of Africa, where, in consequence of the assistance of Juba, king of Numidia, the affairs of the republic still wore a flourishing aspect. Cesar, in the mean time, instantly followed Pompey into Egypt: but this formidable enemy was now no

longer in a situation to cause any disturbance,—he had been basely murdered; and Cesar is said to have wept, and to have turned away his face, when Pompey’s head was presented to him.

In Egypt, he engaged in a very idle and dangerous war, as is thought, chiefly at the instigation of Cleo-

patra, in whose society he forgot; for a considerable time, the stake for which he was contending, and the armies which were forming in Africa to dispute with him that empire at which he aimed. After this foolish interlude, he marched against Pharnaces, the son of Mithridates, who had hoped to regain his father’s possessions, amidst the commotions which distracted the state. Cesar made great ostentation of the facility with which he conquered this enemy; and to detract from the glory of Sylla and Pompey, who had triumphed over this prince’s father, he said, “how cheap is fame, when obtained by fighting against such an enemy?” The trophies gained in this victory were distinguished in his triumph by labels bearing this inscription, Vent, Vidi, Vici. Cesar now hastened to Italy, where Antony had been ruling in his absence, with the haughtiness and state of a despot. He gave orders for the veteran legions to embark for Africa, under the command of Sallust the historian, who had all along been devoted to his party. The troops, however, refused to obey; several of their officers were killed in a tumult, and Sallust escaped with difficulty: they marched straight to Rome, and Cesar, contrary to the advice of his friends, presented himself to the mutinous soldiers. They demanded immediate dismissal, and the reward of their past services. With his usual address, he confessed that their demand was highly reasonable, and should be instantly complied with. He address-

ed them by the appellation of Quirites, and said he was sensible that they had already done too much, and were unfit to contend with new dangers. We do not exactly know what mystery there is in this word; but it appears not to have been familiar to the ears of soldiers: for they immediately carried out, that they were no Quirites, but soldiers, willing to serve; and from the height of mutiny and despri-

dence, they proceeded, as is not unusual in such cases, to the extremes of submission. After a very difficult campaign in Africa, the forces of the re-

public were at last completely defeated; and Cato, the head and hope of the party, perceiving that all was lost, killed himself in despair. “I must envy this man,” said Cesar, “the splendour of his death, as he has refused me the honour of preserving his life.”

He was now absolute master of the empire; and except in quelling a rising in Spain under the son of Pompey, was engaged in no other military enterprise. The senate and people at Rome now vied with each other in acts of servility, and in decreing the most extravagant honours to the subverter of their liberties. Cesar showed himself pleased with these demonstrations of submission; and, to make the yoke sit as easy as possible upon them, his ad-

ministration was distinguished by the utmost liberali-
yty and magnificence. Instead of gladiators, he ex-
hibited engagements between considerable parties of cavalry and infantry; he showed the manner of fight-
ing with elephants, having forty of these animals trained for the purpose. In these combats, the par-
ties being captives or malefactors condemned to die, exhibited all the efforts which could be made in real

fight. He spread an awning of silk, a rare article at that time, over the public theatres, that under this delicate covering the spectators might enjoy the sights of bloodshed and horror, undisturbed by the
rays of the sun: and, to complete this expensive magnificence, he entertained the people at a public feast, at which twenty thousand couches were placed for the guests.

This affectation of regal pomp, gave great disgust to the noble families at Rome; and Cesar had shown himself to be fond not only of the state, but of the title of a king, which had been odious to the Ro-

man people ever since the expulsion of the Tarquins.

One of his emissaries, to suggest the propriety of bestowing this title, bound the head of one of his

statues with a royal fillet. The tribunes affecting great zeal for the honour of Cesar, sent the author of

this act to prison. He was much displeased with this officious interposition of the tribunes, and hear-
ing them called Brutus’s, as restorers of the public liberty, he said, they were Brutus indeed, but took no farther notice of the matter.

A short time after this, some one in the assembly of the people saluted him with the title of king; but instead of acclamations, there was a general

murmur of dislike: and he thought proper to dis-
countenance this unseasonable flattery, by saying, that his name was Cesar, and not King. Nobody doubt-
ed, however, that he now aspired to this title; and
this opinion was still farther confirmed, when, on the 16th of February, at the Lupercalia, Antony, his chief confidant, publicly offered him a crown. It was the custom in this festival for the first officers of the state, along with the principal nobility, to run naked through the streets, striking with thongs of undressed leather, all who happened to be within their reach. Even women presented themselves in this indecent ceremony, regarding a stroke of the thong as a sovereign cure for barrenness. Antony bore his part in this ceremony; and when he came opposite to Cæsar, who was seated on a gilded chair, and in his triumphal robes, he presented him with a royal crown, saying, "This crown the Roman people confer on Cæsar by my hands." Cæsar perceiving a general silence, pushed away the crown with his hand, upon which there was an universal shout of applause, a sufficient explanation of the popular feeling.

These obvious advances towards royalty gave great offence; whilst the facility of cutting off the tyrant encouraged a combination against his life. Cæsar had foolishly imagined that he would be able to uphold, by the voluntary submission of the people, that power which he had obtained by violence and blood. With this view he dismissed his guards, saying that he would rather die at once than live always afraid of death. He endeavoured, indeed, to reconcile the people to his government, by mildness, clemency, and munificence; but it was impossible to obliterate from their minds the remembrance of their former constitution, and of the way in which he had obtained his power. A conspiracy, therefore, was formed against his life, not by those who had suffered amidst the devastations occasioned by his ambition, but by some of his own particular friends, who were fired with the enthusiasm of liberty, and animated with the vain hopes of restoring the glories of the republic. At the head of this conspiracy were Caius Cassius, Marcus and Decimus Brutus, and Trebonius, with about sixty others. A meeting of the senate had been fixed to take place on the ides of March, and this was the time which the conspirators had chosen for the accomplishment of their design. Cæsar, however, being indisposed, had resolved not to attend the senate that day; but was induced to change his mind on the persuasion of Decimus Brutus. As he passed through the streets, a paper was put into his hands, which he was requested to read immediately, as it contained secrets of the utmost importance. He attempted to read it, but was prevented by the multitudes, who crowded round him with applications; and he still held it in his hand when he entered the senate.

Brutus and most of the conspirators had taken their places before the arrival of Cæsar. Cimber, one of the number, entered along with him, urging a petition in favour of his brother. Having received a denial, he took hold of his robe, as if to press the interview. "Nay," said Cæsar, "this is violence." Upon this, Cimber flung back the gown from his shoulders, this being the signal agreed upon, and called aloud to strike. Cæsa aria the first blow, and immediately the swords of all the conspirators gleamed around him, who, in their eagerness to reach his body, wounded one another. It is said that he made a stout resistance, till he saw Brutus strike, when muffling up his face in his mantle, he fell at the foot of Pompey's statue, pierced with three-and-twenty wounds. Cassius exclaimed, "These lies the worst of men!" Brutus, holding up his sword, still reeking with blood, called upon the senate, and upon Cicero by name, to judge of the transaction which had passed before them. But all who were not in the secret, being thunderstruck, and not knowing where the violence was to end, the senate broke up in horror and consternation; and the people expecting a general massacre, barred their doors, and prepared to defend every one his own habitation.

Thus fell this extraordinary man, after having been only about five months in the undisputed possession of that power which it had been the object of his life to obtain. Cicero, judging either from the general feeling, or from Cæsar's evident neglect of his own safety, had predicted his fall with a precision which might seem oracular. In writing to his friend Atticus, he says, Jam intellignes id regnum ex semestre esse posse. Corowit adee nexets, ant per adversarios, aut ipse per se; et id spero vivus nobis fore.

Cæsar was unquestionably the most extraordinary character that has appeared in history, either in ancient or in modern times. Others have often risen from small beginnings to a high degree of power, by improving the favourable incidents which pointed the way to distinction and honour. But Cæsar appears as the framer of his own fortune: in his history scarcely any thing occurs which we can call accidental; all the great objects which he accomplished were the result of accurate calculation, of a just knowledge of his own resources, and of profound observations on human nature. With regard to other individuals, we generally err in ascribing too much to preconcerted plans, and in diving too deep for the motives of their actions; but in the case of Cæsar, it is probable that we more frequently err in not perceiving the full extent of his schemes, or in not discovering those more minute and more complicated principles which suggested the mode of conduct which he adopted. Viewing him merely as determined on subverting the liberties of his country, we see nothing in him to admire but his uncommon abilities. Catiline and others had desired to accomplish what he so successfully achieved; but they wanted that prudence, fortitude, and perseverance, which alone could secure the success of their enterprise. Cæsar set out with the resolution of enslaving his country. He was not impelled to it by the necessity of his circumstances, nor by any sudden fit of passion. It was the settled, determined, purpose of his soul; and he adopted the most judicious measures to obtain his object. His plan of ambition was cool, deliberate, and systematic: this was early observed by Catu, who used to say, Omnem ex omnibus Cæsarem ad evertendam rempublicam sobrium acce- sistisse. "Sueton. Vit. Cæs.

But it would be an unfair representation of his character to stop with these observations: he possessed so many splendid endowments of genius, and so many amiable qualities of the heart, that we are at
a loss whether we should most detest his ambition, or admire his learning, his taste, his humanity, his munificence. He had no propensity to cruelty, nor any thirst for blood: he had too little jealousy of mankind for his own safety, and less than might have been expected from his great penetration. Cicero, who detested his politics, and who celebrates the authors of his assassination as heroes and deliverers of their country, is nevertheless candid enough to acknowledge his extraordinary merit in other respects. He allows him to be a most admirable writer; a perfect master of the choicest latinity; an orator inferior to none, who had made eloquence the whole study of their lives. Had he lived, it is probable that his administration would have been the most splendid and the most liberal of any which have occurred in the annals of despotism. Give him but the title and honour of master, and he seemed willing to allow the utmost freedom of thinking and acting. Even after he had reached the zenith of his power, Cicero hesitated not to write an eulogium on Cato, who had always been Caesar's most inveterate political enemy, and had killed himself rather than submit to his power: So far from shewing any resentment at this, he entered the lists with Cicero, on a field where it was thought few could contend with him, and published an examination of Cato's character, in a work entitled "Anticato"; in which he pointed out the blemishes of his character, and endeavoured to show that Cicero's praise of him was greatly exaggerated.

In his military character, it is probable that he never has been equalled. Like Alexander the Great, he often undertook enterprises which would have been rash and ruinous in the hands of ordinary leaders, but the success of which was secured by the vast resources of his mind. Indeed the Grecian conqueror can scarcely stand a comparison with Caesar. He over-ran nations sunk in luxury and effeminacy; Caesar conquered the conquerors of the world, and triumphed over the most accomplished and skilful leaders. His Commentaries are not only specimens of the purest latinity, but they are a treasure of military science, and show the vigilance and skill continually exercised by this great commander.

We may perhaps even find some palliation for his ambition in the degenerate state of Roman manners. He saw that the republic was virtually dead; and that the sovereignty must soon be the prize of the man who had power or address to seize it. This made him less scrupulous about the measures which he employed; whilst the generosity of his nature taught him to believe, that he could render his usurpation a public benefit. In no hands could unlimited power more safely be lodged; for the world has never seen a more able nor a more amiable despot than Julius Caesar.

CAFFA, or KAFFA, probably the Theodosia of the ancients, is a seaport town of the Crimea, situated on a high mountain, which descends with a half circular slope towards the roadstead. From the beautiful bay of Caffa, the town appears to cover the southern side of it, and to rise like a vast theatre, with its numerous mosques and minarets, over all the hills which encircle that part of the bay. On the southern side of the bay stood the Genoese citadel: The walls, which are tolerably well preserved, are flanked with towers, and marked with several half effaced inscriptions. The traces of the streets, within the enclosures, are still visible, and numerous subterraneous chambers, and spacious magazines, amid a promiscuous heap of ruins, assert the former splendour of this deserted city. The opposite, or northern side of the city, which was the residence of the Tartars, is the only part which is now inhabited. Between these two parts of the city, but rather towards the west, and elevated on the hills above them, stood that part of the town which was inhabited by the Armenians, and which is now a scene of ruins. Near the walls of the old Armenian fortress, and on the high-ground above the Tartar city, are the ruins of a circular building, which Dr Clarke supposes to have been an ancient bath. On taking down a part of the stucco which loosely adhered to the wall, that celebrated traveller discovered a beautiful covering of coloured plaster, exactly similar to that which is found in Pompeia and Herculaneum. A few days before Dr Clarke's arrival, (July, 1800), a stone was discovered in the centre of the old pavement of this building. It was rudely sculptured in two parts, upon a kind of Cippus. In the upper part were two crowned heads, and the lower part contained a staircase leading to the mouth of a stone sepulchre. "I endeavoured," says Dr Clarke, "to prevail on the guides to follow the clue thus offered, and to search for the staircase so represented, below the spot on which the stone itself was found. This they refused to do."

The other buildings, which are deserving of notice, and which are in the Tartar city, are some magnificent public baths and mosques in a ruinous condition, a few minarets, several shops, the Turkish coffee-house, an unfinished palace of the late Khan, and a large stone building at the entrance of the city, which was formerly a miatt. Near this building there are some ruins, which Dr Clarke thinks may have belonged to the ancient Theodosia. The earliest inscription which he could find was not before the end of the 14th century. One of these, in the Armenian language, sculptured in relief, on a slab of white marble, was brought home by Dr Clarke, and is now in the vestibule of the university library of Cambridge. See Clarke's Greek Marbles, p. 3. No. viii.

The following account of the devastations commit-
The melancholy devastation committed by the Russians, while it draws tears down the cheeks of the Tartars, and extorts many a sigh from the Anatolian Turks who resort to Caffa for commercial purposes, cannot fail to excite the indignation of every enlightened people. At Caffa, during the time we remained, the soldiers were allowed to overthrow the beautiful mosques, or to convert them into magazines, to pull down the minarets, tear up the public fountains, and to destroy all the public aqueducts, for the sake of a small quantity of lead which they were thereby enabled to obtain. While these works of destruction were going on, the officers were amusing themselves in beholding the mischief. Tall and stately minarets, whose lofty spires added much grace and dignity to the town, were daily levelled with the ground; which were of no other value to their destroyers than to supply a few soldiers with bullets,† or their officers with a dram. I was in a Turkish coffee-house at Caffa, when the principal minaret, one of the ancient and characteristic monuments of the country, to which the Russians had been some days employed in fixing blocks and ropes, came down with such violence that its fall shook every house in the place. The Turks seated on divans, were all smoking, and when that is the case, an earthquake will scarcely rouse them; nevertheless, at this flagrant act of impiety and disidence, they rose, breathing out deep and bitter curses against the enemies of their prophet. Even the Greeks, who were present, testified their anger by similar imprecations. One of them turning to me, and shrugging his shoulders, said, with a countenance of contempt and indignation, Σωθίνς! Scythians! which I found afterwards to be a common term of reproach; for, though the Greeks profess the same religion as the Russians, they detest the latter as cordially as do the Turks or Tartars. The most lamentable part of the injury thus sustained, has been in the destruction of the conduits and public fountains, which conveyed, together with the purest water, from distant mountains, a source of health and comfort to the people. They first carry off the leaden pipes in order to make bullets; then they take down all the marble slabs and large stones for building materials, which they employ in the construction of barracks; lastly, they blow up the channels which convey water, because they say the water porters cannot earn a livelihood when there are public fountains. Some of these fountains were of great antiquity, and beautifully decorated with marble reservoirs, as well as with bas-reliefs and inscriptions. In all Mahometan countries, it is considered an act of piety to preserve and to adorn the public aqueducts. Works of that nature once appeared in almost every street of Caffa; some were public washing places; others poured out streams of water as clear as crystal for allating the thirst of the inhabitants, and for ab-

† The Russian troops are obliged to provide themselves with lead.

‡ In all the recent accounts of this town, it is said to contain four or five thousand houses.
CAFFRARIA.

S. Lat. on the east. Some geographers have dilated these boundaries, and have applied the name to the whole country lying south of Cape Negro and the river Del Spiritu Santo, and reaching toward the north, between Lower Guinea and Monomotapa, as high as the equator. But the appellation Caffraria must be confined to that portion of country inhabited by the Caffres, from whom it takes its name; and as this people differ very widely in appearance, in disposition, and in manners, both from the negroes on the north, and the Hottentots on the south, the extent of their territories has been ascertained with considerable accuracy.

Of this country, however, our knowledge is as yet very defective. No travellers have penetrated far enough into the interior, so as to be enabled to give a correct description of its productions and inhabitants. Their excursions have been confined to some particular hordes; and from the manners and appearance of these have been drawn the general character of the nation. The Booshuanas, Barroloos, Damaras, Tumbooikes, and the inhabitants of Caferland, who are particularly distinguished by the colonists of the Cape of Good Hope by the name of Caffres, are the only tribes of which we have any account; and it is to the latter of these that the descriptions of Paterson, Sparman, Vaillant, and Barrow, chiefly refer.

This country towards the east is in many places extremely fertile. The mountains are covered with immense forests. The plains are clothed with a luxuriant herbage, and refreshed and fertilized by innumerable streams. But towards the west, in the country of the Damaras, it is a perfect desert. The inhabitants keep no kind of cattle. Their country, in fact, is so totally barren and sandy, that no cattle could exist upon it; and the whole subsistence of the tribe depends upon the exchange of copper rings and beads for provisions with the Booshuanas on the east, and the Namaqua Hottentots on the south. These articles they themselves manufacture from the copper ore, which is found in great abundance, in a chain of mountains extending from the Orange river to the tropic. The climate is very variable, but it seldom rains, except in summer, when it is attended with thunder and lightning. On the banks of the Great Fish river, which is the boundary between the colony and Cafferland, Mr Barrow experienced a very remarkable variation in the temperature of the air, during the space of two days. When descending the heights towards the level of the river, the thermometer, which, on the preceding night, was as low as 59°, and which, at noon, had stood at 72°, in the course of an hour ascended to 102° in the shade, and to 106° when exposed to the direct rays of the sun. The wind, he observes, was due north, and remarkably strong, and the stream of air was so heated, that it was scarcely possible to bear exposure to it for any length of time. On the following day, however, on the same spot, and with the same wind, but less strong, the thermometer was no higher than 71°.

The inhabitants of this country, though generally denominated Caffres, call themselves Koussis. They know no such word as Caffe; in fact, they are unable to pronounce it, as they have no sound for the letter R in their language. The name is derived from the Arabic oppress, signifying infidel. It was applied by the Arabs as a term of reproach to all who did not profess the religion of Islam; and the Portuguese, taking it in a general sense, have extended it to all those nations of Africa who seem to have no knowledge of a Deity. That the Caffres are not the original inhabitants of this country, appears perfectly evident, from their great dissimilarity, in almost every respect, to the other nations that surrounded them; and we cannot but agree with Mr Barrow, that they are of Arabic origin, though we may somewhat differ from that intelligent traveller in proving their affinity to that nation. They possess many features of resemblance, both in shape and in manners, to the nomadizing tribes of the Arabian desert. They have the same contour of visage, the same pastoral habits, and the same hospitable disposition; and what fixes their affinity still stronger, they practise the same rite of circumcision. But it becomes a question not undeserving of a solution, (though we do not pretend to give one altogether satisfactory,) how came they into their present insulated situation? Had they ever constituted a part of the armies of the Mahometan caliphs, which overran the northern shores of Africa, and extended their conquests along the eastern boundaries of this continent, we cannot suppose that they could have been so separated from their companions, as to forget the very name of the nation to which they originally belonged, and to retain no traces of that religion which they had laboured to propagate and maintain. We know that when Vasco de Gama visited this country, in the end of the 15th century, the Arabs had possession of all the coast from Cape Co- rientes to the Red Sea. It is consequently very improbable, that a people of the same language, of the same religion, and inhabiting the adjacent country, should have been so completely cut off from all communication with their brethren. Were we to form a conjecture upon this subject, we should date the emigration of this people prior to the final subjugation of Arabia to the Mahometan faith. The opposition which the religion of the impostor experienced from his countrymen, on his first appearance as a reformat; the difficulties which he afterwards met with in the prosecution of his schemes throughout the peninsula; and the circumstance that there are some of the Arab nations who, even to this day, have withstood the power of the Mahometans, and are still idolaters; induce us to suppose, that some of the independent tribes would prefer to forsake their country, rather than the religion of their fathers. These passing over into Ethiopia, might wander southward in search of new settlements; and, driven before the swords of the conquering Moslems, might receive the appellation of infidels, which they still retain, and which might prevent all intercourse between them and their oppressors. Their adherence to the rite of circumcision cannot be urged, as is done by Mr Barrow, as any proof whatever of their having formerly professed the religion of Islam. This rite is not peculiar to that religion, but was practised by the descendents of Ishmael long before the appearance of Mahomet; and, according to Josephus, was performed, not on the eighth day, as was the custom of the Jews, but when about twelve or thirteen years old,
Caffria.

which period is still observed both by the Mahometans and Caffres. This ceremony, however, the Caffre does not consider as a sacred institution, but merely as a custom handed down to him by his ancestors, and as a duty which he owes to their memory. It is the only exterior mark of religion which he seems to have retained; and if he possesses any religion at all, it is a religion without worship.

The appearance of the Caffre bespeaks him to have sprung from a race very superior to his neighbours the Hottentots of the Cape, or the negroes of Mozambique. He has neither the protruding cheekbones and contracted chin of the one, nor the large broad face, flat nose, and thick lips of the other. The contour of his visage and head can scarcely be distinguished from that of an European; his countenance is open and manly, and generally overspread with a smile; his eyes are large and black, his teeth as pure as ivory, and his hair short and curled; his figure is tall, muscular, and elegant; and his carriage firm and erect. "A young man about twenty," says Mr. Barrow, "of six feet ten inches high, was one of the finest figures that perhaps was ever created. He was a perfect Hercules, and a cast from his body would not have disgraced the pedestal of that deity in the Farnese palace." The women, however, are not of such a handsome make, being rather of low stature, and strong limbed; but they are sprightly, good-humoured, and active; and their countenances are animated with dark sparkling eyes, and regular and beautiful white teeth. The same traveller, when describing a party of Caffre women, the first indeed which he had met with, observes, "Good temper, animation, and a cheerful turn of mind, beamed in all their countenances. We found them to be modest, without reserve; extremely curious, without being troublesome; lively, but not importunate; and sportive, without the least shadow of being lascivious." The Caffres also surpass their neighbours in the qualifications of their minds. They are mild, benevolent, and hospitable, but at the same time brave, and devoid of fear or suspicion; and in their manners have more the appearance of civilization than any other unlettered nation in the world.

Their language, though they retain not the smallest vestige of a written character, surpasses that of many nations who can boast of greater refinement and civilization. "In the enumeration," says Mr. Barrow, "it is soft, fluent, and harmonious; has neither the monotonous monothong of the savage, nor the nasal nor guttural sounds that prevail in almost all the European tongues; and is as different from that of the Hottentots, as the latter is from the English." The names of the mountains and rivers of this country, however, are all Hottentot, which is a presumptive proof that the Caffres are not the aborigines of these possessions which they now enjoy.

The habitations of these people are in general circular, and in the form of beehives, and are larger and more regular than those of the Hottentots. In Cafferland, the frame is constructed of wood, which is plastered both within and without with a kind of mortar made of yellow clay and the dung of cattle, and a neat covering of matting is wrought over the whole. Their temporary abodes, when wandering about with their cattle, are generally formed of the shrubbery of the woods, and consist of a few living twigs bent and interwoven into each other in the form of a parabola, and covered over with branches of trees and long grass.

The village which Mr. Barrow visited, contained only from 40 to 50 huts; but among the Booshanaas and Barraloos, the towns are much more extensive and better built. (See these articles.) The Caffres rub their faces and bodies with a solution of red ochre, and the practice of tattooing is very general throughout the nation. The dress of the men consists chiefly of a long cloak made of calf skins; which in summer they throw entirely aside. They are fond of ornament, and their legs and arms are decorated with rings of ivory, or bracelets of copper and iron. Their necks are surrounded with glass beads, or a string of small bones, to which they give a most beautiful polish, and some of them wear porcupine quills stuck through the ears. The women have also a skin cloak reaching below the calf of the leg, which they wear in all seasons, and which is studded with brass buttons. The head is covered with a close leather cap, ornamented with beads, shells, and pieces of polished iron or copper; and from their neck, which is decorated with a vast variety and profusion of ornaments, is suspended the shell of a small land tortoise, in which they carry some red ochre, and a thin piece of leather to rub it upon their faces.

The Caffre is both a shepherd and a warrior, but he only assumes the latter character when the emergencies of his tribe call for his assistance. War is not with him an employment which he prosecutes in order to satisfy his thirst for blood or plunder, and is never entered into, either for extension of territory or individual aggrandizement. It is only when compelled to take up arms by the aggression or injustice of a neighbouring horde, that he renounces for a time his peaceful habits, and enters into all the horrors and fatigue of war. His principal weapon is the omkontoo, or hassagai, as it is called by the Hottentots, from the name of the tree of which the shaft is formed. It is an iron spear, nearly a foot in length, fixed to a tapering shaft, about four feet long. This he throws with great address, and seldom fails of hitting his object if within fifty or sixty paces. His other weapon is the keerie, which he uses either in close engagement or at a distance. It is a kind of club about two feet and a half long, and at one end nearly three inches in diameter. He carries also an oval shield about four feet in length, made of the thickest part of a bullock's hide, upon which he receives the darts and arrows of his enemy. He disdains, however, to poison his weapons as is done by his neighbours the Basjesmans and Hottentots, and considers it as unworthy both of his courage and his humanity: neither does he attack by surprise, but boldly opposes himself to his adversary in the open field. "Le Caffre," says Vaillant, "cherche toujours son ennemi face a face; il ne peut lancer sa hassagai, qu'il ne soit a découvert; le Hottentot, au contraire, caché sous une roche, ou derrière un buisson, envoie la mort, sans s'exposer a la recevoir; l'un est le tigre perfide qui fond traiteusement sur la proie; l'autre est le bon generoux qui s'annonce, se montre attaque et perit, s'il n'est pas vainqueur."
The Caffres are governed by chiefs, whose dignity, however, consists entirely in the respect and love of their subjects, and from whom they are distinguished by a brass chain, suspended on the left side of the head from a wreath of copper heads. But though completely independent of one another, yet one among these is generally acknowledged as superior to the rest, and is supposed to hold the sovereign power. This honour is hereditary, and can only be inherited by a son or a nephew, who succeed according to primogeniture; for, failing these, a king is chosen by the chiefs of the different horde, which is frequently attended with discussions and bloodshed.

A chief has no power over the lives or properties of his subjects; but is amenable for every offence to the established laws of his horde or nation. These laws are extremely simple, and grounded entirely on natural principles. Premeditated murder is punished with instant death; but if a murder be committed in self-defence, in a quarrel, or by accident, a fine is paid to the relations of the deceased, as a compensation for their loss. This fine is either agreed to among themselves, or is settled by the chiefs and elders of the horde; and the amount is generally estimated by the value which the deceased bore in society. Restitution is the only punishment for theft; and they appear to be utterly unacquainted with the practice of imprisonment.

Cattle constitutes the sole wealth of the Caffres, and the tending and rearing of them are their principal employment. Some of their oxen are remarkably large, and resemble the Alderney cow; others are small and strong, not unlike the black cattle of the Highlands. The horns of their favourites are twisted into a variety of forms, particularly of those which are used for riding, for they have no horses. They manage their cattle with great regularity. Every movement is done by the sound of a whistle, made of bone or ivory, which is heard at a great distance, or by a similar noise made with the mouth, and which the animals seem perfectly to understand. In the morning they are dispersed to pasture by a particular signal; another collects them in the evening; and at a third the cows separate from the herd, and come forward to be milked; which operation, and also the management of the dairy, are entrusted entirely to the men. The drudgery and hard labour are left for the women, who not only look after the household affairs, but construct their habitations, break up the ground, sow the grain, and gather in the harvest. They are also employed in the manufacture of baskets for holding the milk, and of earthen pots in which they boil their food. These baskets, which are made of a species of cyperus, or strong reedy grass, are exceedingly neat, and the texture is so close, that they are capable of containing the thinnest fluid.

Agriculture is practised in this country, particularly in Cafferland, to a very limited extent; and though the soil requires very little preparation, and is so extremely fertile, that every vegetable substance, whether sown or planted, grows with great luxuriance, yet millet, and a large species of watermelon, are their principal culinary plants. They cultivate also some tobacco and hemp, which are used only for smoking; and the effects of the last are said to be fully as narcotic as those of opium. But they appear to be more attached to a pastoral than an agricultural life,—a circumstance which must necessarily retard their progress in civilization. Towards the west, however, among the Booshanans, agriculture seems to have arrived at considerable perfection; and the British commissioners, who were sent into that country in 1801, to procure a supply of draught oxen, passed through several large tracts of ground, that were laid out and cultivated like so many gardens; and in the neighbourhood of Leta-koo, they found several extensive fields, which were sown with a species of holcus. Though possessed of immense herds, and though much of their spare time is employed in hunting, yet they use very little animal food. They rarely kill any of their cattle, except as a token of hospitality, when visited by strangers; and they have no other domestic animals which can yield them subsistence, for in the whole Caffre country there is neither sheep, goats, pigs, nor poultry. They live chiefly upon milk, which they always use in a curdled state. To this they add a few grainy roots, various kind of berries, and the seeds of plants called by the natives Plantains, which grow spontaneously in the woods, and on the banks of the rivers. They use also the pith of a certain species of palm, which they let lie for several days, until it becomes sour, and then bake it in the oven. Their ignorance of fermented or distilled liquors, and their temperate diets, exempt them from many disorders to which other savage nations are subject.

The commercial intercourse of the Caffres is confined to the Dutch farmers, and their eastern neighbours the Tambookies. The illicit trade with the former, consists entirely in the exchange of their cattle for pieces of iron, copper, glass-beads, and other trifling articles; but from the Tambookie nation they derive a more valuable commodity—their wives. Marriage among the Caffres is merely a bargain between the lover and the parents of his mistress. A previous courtship, and the daughter's consent, is seldom thought necessary. She considers herself the property of her father, and entirely at his disposal, and is neither surprised nor moved when informed of her fate. The common price of a wife is an ox, or a couple of cows; but the Tambookie wives are much dearer, as they are more esteemed, and are in general confined to the chiefs. Though polygamy be allowed, the custom of purchasing their wives prevents any inconvenience resulting from the practice of it, as few of the common people can afford to obtain more than one. The celebration of the marriage is attended with rejoicing and dancing, which sometimes lasts for weeks, according to the wealth of the parties. Their music and dancing, however, are both miserably bad. "A Caffre woman," says Mr Barrow, "is only serious when she dances; and at such times her eyes are constantly fixed on the ground, and her whole body seems to be thrown into convulsive motions."
The method of disposing of their dead differs from that of all their neighbours. The honours of sepulture are bestowed only on their chiefs, who are commonly interred very deep, in the places where their oxen stand during the night, or are covered over with stones, heaped up in the form of a cupola. The children are deposited in the ant-hills which have been excavated by the myrmecophagi, or ant-eaters; but all the rest are thrown out into an open ditch, which is common to the whole horde, and are there left without covering, to be devoured by the wolves. It is from this circumstance that the country abounds with these animals, as a Caffre, in consideration of their services in this respect, never attempts to destroy them. But however shocking and unnatural this practice may appear, yet the Caffres entertain a great respect for the memory of their deceased relations; and to swear by one of them is considered as an inviolable oath.

When Mr. Barrow visited Cafferland in 1798, the supreme authority was held by a young chief called Gaika, who was of a most amiable disposition, and possessed a clear and vigorous understanding. He had been at war with his uncle Zambie, who, having acted as regent during the minority of his nephew, had refused to resign to him the government on his coming of age. In this war Zambie had been joined by a powerful chief to the northward; but Gaika, assisted by his father's friends, had been completely victorious, and had taken the usurper prisoner. This man, however, he treated with great lenity, restoring to him his wives and all his effects; and the only restriction that was imposed upon him, was to be always in the same village with the king. Gaika was well affected towards the British government at the Cape; and were the hostilities of the Dutch boors sufficiently repressed, there is no doubt but that the Caffre nation, under such a chief, would make a rapid advancement in civilization. See Barrow's Account of Travels in Southern Africa, vol. i. p. 166, &c.; and vol. ii. p. 112. Le Vaillant Voyage dans l'interieur de l'Afrique, tom. ii. p. 200, &c.; Sparrmann's Voyage to the Cape of Good Hope, vol. ii. p. 165.; Thunberg's Travels in Europe, Africa, and Asia, vol. i. and ii.; and Paterson's Journeys into the Country of the Hottentots and Caffraria, p. 92, &c. (p)

CAGLIARI, or CALARI, the capital of Sardinia, stands upon a commanding eminence, at the bottom of a capacious bay on the southern side of the island. The town rises from the sea, and, with its vicinity, has a very handsome appearance from the bay. It is defended by a castle and regular fortifications, and is divided into the upper town, which is improperly termed "The Castle," and the lower town, or suburbs. The former is walled round, and contains some tolerable buildings; but the latter, which lies upon the shore, is irregular and dirty, and chiefly inhabited by the poorer classes. Cagliari was the residence of a viceroy, the see of an archbishop, the place of assembly for the cortes or states general, and the seat of an university, founded in 1600. It contains a superb cathedral, five churches, and twenty convents; and had a royal audience, and several other tribunals.

This town possesses an excellent harbour, and is most conveniently situated for an extensive commerce. The want of proper encouragement, however, and burdensome restrictions, prevent the inhabitants from profiting by these advantages. They have little trade, and seem to be completely absorbed in indolence. The harbour is screened by a small island called Pietra Laida, and in the bay a numerous fleet may anchor in safety, in from three to fifteen fathoms of water. A small mole, capable of containing four galleys, lies opposite the low town. It is shut in towards the south by a wall rising about three feet above the sea, which serves as a rampart, and has a battery of eleven pieces of cannon.

Cagliari is supposed to have been first founded by the Carthaginians, and called Caralis. Upon the appearance of a British fleet under Sir John Leake in 1708, the inhabitants, fearing the destruction of their town, compelled the governor to surrender, after a few shots, when it was transferred to the Emperor Charles VI. It was, however, retaken by the Spaniards in 1717, and about two years after ceded to the house of Savoy. Population 30,000. N. Lat. 39° 25'. E. Long. 9° 16'.' See Peuchet Dictionnaire, &c.; Azumi Histoire Geographique, Politique, et Naturelle de la Sarlagine, 1801; and Della città Cagliari, della città Sassari Notizie compendiose sacre e profane, 1780. (L)

CAHORS, a town of France, anciently called Divona-Cadurci, and, before the revolution, the capital of Quercy, and a bishop's see, but now the chief place in the department of the Lot, is situated upon a peninsula formed by that river, about 143 leagues south from Paris. It is an irregular town, with narrow streets, built partly against the steep side of a hill, and defended with a thick wall and regular fortifications. The cathedral, which is ornamented with a large cupola, bears evident marks of antiquity; and there are still to be seen the ruins of a Roman amphitheatre and aqueduct. It has an academy and lyceum; but its university, which was established in 1392, was united to that of Toulouse in 1751. Cahors has some manufactures of superfine and common drabs and ratteens. Its principal trade and wealth, however, are derived from the vineyards in the neighbourhood, which annually produce about 60,000 pipes of wine. This wine holds a high rank among the red wines of France, and great quantities of it are transported by the lot and the Garrone to Bordeaux, from whence it is carried to Holland and England. This town carries on also a considerable traffic in hogs and walnut oil with Languedoc and Spain. It formerly had four annual fairs, each of which lasted four days; but it has now twelve, of one day each, which are held on the first day of every month, except in January and November, when the fair is kept on the third.

Cahors is governed by a prefect, a secretary-general, a receiver-general, a paymaster, and a director of the customs; and has a court of criminal and special justice, a tribunal of commerce, and a chamber of manufactures. Population 12,000. N. Lat. 44° 26'. E. Long. 1° 92'. See Peuchet Dictionnaire, &c.; and Tyna Almanach du Commerce, 1811. (L)

CAIPA, CAIPA or HEIFA, EPHE, KHEPH.
CAIFONG. See Kaifong.

CAILLE, NICHOLAS LEWIS DE L'A., a celebrated French astronomer, was born at Rumigny, in the department of the Aisne, on the 15th of March 1713. The example of his father, who, after quitting the army, dedicated his leisure hours to mathematical and mechanical pursuits, excited in the mind of his son an ardent passion for the same studies. After having gone through the usual course at school, where he gave manifest indications of his future talents, he went to Paris in 1729, to perfect himself in the study of the classics and philosophy. Being intended for the church, La Caille was sent to study theology at the college of Lisieux; but his love for astronomy became so great, that he declined entering into priest's orders, lest his religious duties should be sacrificed to his ardour for science. At the early age of 18 La Caille lost his father, and was left without any means of support. The Duke de Bourbon, however, by whom his father had been patronised, generously entered the same kindness to the son, and provided for all his wants. In 1736 he became acquainted with Bailly, by whom he was recommended to James Cassini, who obtained for him an appointment in the observatory; and by his valuable instructions, he acquired much additional knowledge of his favourite science, and obtained a thorough acquaintance with the difficult art of observation. During the year 1739, he was engaged, along with M. Cassini de Thury, the brother of his friend, in the general survey of France, an account of which was published in 1744, under the title of Méremienne de l'Observatoire Royal de Paris vérifié; and, in the same year, he was appointed to the professorship of mathematics in the college of Mazarine. La Caille was, on the 3d May, 1741, admitted a member of the Academy of Sciences, and he has enriched the memoirs of that learned body with many valuable communications. In 1749, he published his Leçons de Mécanique. His Leçons Élémentaire d'Astronomie, which has been translated into English by Robertson, appeared in 1746; a second edition was published in 1755, and a third edition by La Lande in 1750. The Leçons Élé-

CAIPIE, and GABE, are different names which have been given to a sea-port town of Palestine, situated at the foot of Mount Carmel, and opposite to Acre, from which it is separated by the bay of Acre.

This place was formerly but a wretched village, constructed from the ruins of the ancient Porphyria, the remains of which may be seen in less than a mile of Caifa. The ruins of the metropolitan church of Porphyria are still in existence; and it would appear that this place was the Sicanmon of Ptolemy. The houses of Caifa are irregularly scattered, and are small and flat roofed; and, in summer, the inhabitants were accustomed to sleep in arbours, formed of the boughs of trees. Since Caifa came into the possession of the chief of Acre, a custom-house has been established, and the town has been defended by a citadel, and by walls towards the sea.

As the anchoring ground near Caifa is much superior to that at Acre, the corsairs formerly put in here to sell their prizes, which generally consisted of rice and slaves; and one of the Carmelites usually lent his aid as an interpreter between the pirates and the inhabitants. As the port of Acre has been choked up, and is not able to receive large ships, the vessels which trade with that place cast anchor in the bay of Acre, during the good months of May, June, July, August, and September; but during the other seven months of the year, they are under the necessity of loading and unloading the merchandise of Acre at Caifa, and of transporting it from one place to another in small barks. The town of Caifa exacts a certain tribute from travellers, who visit the church upon Mount Carmel; but the Europeans settled in the town are free from this exaction. The inhabitants are principally Mahometans, Catholics, and Greeks. Distance from Acre, 8 miles south-west. W. Long. 36° 10', N. Lat. 32° 14'. See Acre and Carmel.

which only a small impression was published, he gave the positions of 397 principal stars, which he had determined with the utmost exactness, by means of two instruments of six feet radius, at the observatory of the Mazarine College. This catalogue was the result of nearly ten years labour, and cost him more trouble than he had determined the positions of 4000 in the common manner. It was followed by another, containing the right ascension and declination of 1942 southern stars, selected from the 10,000 which he observed at the Cape. The right ascension and declinations of the other 8000 have not yet been calculated, but all the observations were published by Maraldi in 1763, in a work entitled *Caelum Australe Stelliferum.* Between September 1760 and March 1762, La Caille determined the positions of 515 zodiacal stars; but in the midst of these observations, he fell a victim to his ardour for astronomy. In 1760 he had been attacked with a severe fit of the gout; but though it did not interrupt his observations, his health began gradually to decline, and being seized with a malignant fever on the 15th of March, he died on the 21st of March 1762. M. Bailly finished the calculations which La Caille had begun, and published the catalogue of 515 zodiacal stars, at the beginning of the ephemerides for 1765—1774, which had been calculated by La Caille. This catalogue is also incorporated with the catalogue in our article on Astronomy. It has been lately republished by Mr. Vince in his *Complete System of Astronomy,* vol. ii. p. 513.

In addition to these valuable catalogues, the science of astronomy owes many other obligations to La Caille. After comparing the numerous observations which he made on the parallaxes of the planets, with the observations of Bradley, Zanotti, Cassini, Gentil, Wargentin, Strommer, and Scheumark, he found that 20°.8, the mean of 27 results, was the horizontal parallax of Mars on the 14th September 1751, the day of his opposition to the sun; and that the horizontal parallax of the sun was 10°.4. His memoir on *Astronomical refractions,* published in the Memoirs of the Academy for 1755, contains much valuable information on that difficult subject. It is founded on the comparison of the distances of 160 stars from the zeniths of Paris and the Cape, each of which were observed at least six times with very good instruments.

Beside the works which we have mentioned, La Caille published the *Memoirs of Father Feuille at the Canary Isles;* the *Journal of M. de Chazelle's Voyage to the Levant;* the *Astronomical observations of William, Landgrave of Hesse,* which the Duke de Laval had found at Cassel; and a new edition of Bouguer's *Essai d'Optique sur la Gradation de la Lumière,* which appeared in 1760.

La Caille was elected a member of the Royal Societies of London and Gottingen, and of the Academies of Petersburg, Berlin, Stockholm, and Bologna; and such was his industry and labour, that La Lande maintains that he made more observations and calculations, than all the astronomers together who lived at the same time with himself. ---La Caille had sketched out the plan of an extensive work, to be entitled, "The History of Astronomy through all ages, with a comparison of the ancient and modern observations, and the construction and use of the instruments employed in making them," but he did not live to make any progress in the composition of it. Science might have long regretted this unfortunate event, had not the celebrated Bailly executed the same plan with such brilliant success.

The memoirs published by La Caille will be found in the Memoirs of the Academy for 1741, 1742, 1743, 1744, 1745, 1746, 1747, 1748, 1749, 1750, 1751, 1752, 1753, 1754, 1755, 1756, 1757, 1758, 1759, 1760, 1761, 1763. See the *Histoire de L'Aca-
demie,* 1762. *Connaissance des Mouvemens Céle-
res,* pour 1767; and the *Journal Historique du
Voyage fait au Cap de Bonne Esperance,* par M. De la Caille, published at Paris in 1768 by M. Car-
lle.

(o) CAIRN, a heap of stones thrown together in a conical form. Cairns seem to differ from barrows, only in regard to the materials of which they are composed: they both seem to have been designed for the same purposes; and accidental circumstances directed the one to be constructed of stones, and the other of accumulated earth. In Scotland and Wales, cairns are more common, because the materials are every where to be found in abundance. In England, barrows are more frequent, because stones are not so easily procured for the construction of these monuments. In Egypt, the two forms are sometimes found conjoined, as when a conical mound of earth is surmounted by a pyramid of bricks.

It is in vain that we attempt to trace the history of cairns, or to deduce their origin from any particular nation; they evidently originate in principles common to human nature, and were the first rude monuments of events which men were desirous to commemorate. Wherever we read of a pillar, or a stone set up as a memorial, we see the origin of the cairn, and the principle which gave rise to its construction: Gen. xxxi. 46; Josh. iv. 5. The durability of the substances, of which these monuments were composed, recommended them as memorials to more polished ages, and the splendid pillar and stupendous pyramid are only improvements and extensions of this simple structure.

From this view of the subject, it is evident that we do not mean to confine the uses of cairns, either to the purposes of religion or sepulture: they seem to have been applied to any event which appeared particularly worthy of commemoration. The Israelites raised a great heap of stones on the body of Achan, as a monument of perpetual infamy, Josh. vii. 26; and they also raised a heap of stones to celebrate their miraculous passage over the river Jordan. In the same manner, cairns are raised in Scotland to this

† This catalogue is incorporated with the general catalogue of the fixed stars, which we have given in the article Astronomy, vol. ii. p. 743.
‡ This catalogue was published in the Memoirs of the French Academy for 1752, and has been republished in the *Tables de Berlin,* tom. iii. p. 193.
§ Introduction to the *Ephemerides de 1765—1774,* p. 4.
day, in places where murders or suicides are committed; and there can be no doubt, that many of the ancient cairns are designed to celebrate events of more propitious omen.

As religion, however, even in the rudest states of society, has always deeply interested the feelings of men, we may naturally expect numerous monuments relating to this important subject. Connected with religion is the sepulture of the dead, an object of great importance in the estimation both of civilized and barbarous nations; and there can be no doubt that the cairns in Britain have often been consecrated to both these purposes. Without travelling far into the region of conjecture, we might claim for these humble monuments, the same origin and use which have been ascribed to the lofty pyramids of Egypt. Accordingly, some of our antiquaries have supposed the cairns to be relics of Druidical superstition, and originally dedicated to the worship of the sun; whilst others have contended, that they are to be considered merely as funeral monuments. The first opinion derives some support from a practice common in former times, of going round these cairns at particular periods, according to the course of the sun, when a favourable issue was desired to any event or undertaking; and of moving in an opposite direction, when vengeance and imprecations were denounced against obnoxious individuals: The second opinion derives confirmation, from the circumstance of urns and bones being generally found under these monuments. But the two opinions are not at all inconsistent. The place consecrated to religious uses, would naturally be considered as the most proper receptacle for the sacred relics of the dead; whilst, on the other hand, the feelings which arise from contemplating the remains of our relations and friends, dispose the mind to devotion, and fit the place which contains them for the hallowed purposes of religion.

Cairns are to be found in almost every part of Scotland; and, in a great variety of instances, where their contents have been examined, they have been found to enclose urns, implements of war, ornaments of dress, &c. See Statist. Account passim; and Chalmers’s Caledonia, vol. i.

A late traveller in America pretends, that he has discovered some very singular monuments of this kind. He says, that, on a certain occasion, after removing a quantity of loose stones on the top of an eminence, he came at last to something resembling a tesselated pavement; beneath this he found the figure of a warrior, with a large serpent under his feet, all formed of coloured wood, which fell to pieces on endeavouring to lift it. He also found several rings of metal, which affords him an opportunity of speculating on the ancient civilization of America. See Ashe’s Travels. We should regard the facts as very singular, were we perfectly satisfied as to their authenticity.*

There is a proverb among the Highlanders in Scotland, expressive of honour to the dead, “I will add a stone to your cairn.”

Mr Pennant thus describes a large cairn in Wales. “The name of this place is taken from an immense cairn, or heap of stones, surrounded with great upright stones in an adjacent field. It seems to have a scar of it, passages formed on the sides and tops with flat stones or flags. These were the repositories of the dead. Not that bones or urns are always discovered in them; for the founders, like those of the pyramids of Egypt, appear often to be disappointed in their hopes of having their relics lodged in these labourd mausoleums. A few years ago, there were discovered under a cairn, near the seat of Sir Nicholas Bayley, a passage three feet wide, four feet two or three inches high, and about nineteen feet and a half long, which led into a room about nine feet in diameter, and seven in height. The form was an irregular hexagon, and the sides composed of six rude slabs, one of which measured in its diagonal, eight feet nine inches. In the middle was an artless pillar of stone, four feet eight inches in circumference. This supported the roof, which consisted of one great stone, near ten feet in diameter. Along the sides of the room was, if I may be allowed the expression, a stone bench, on which were found human bones, which fell to dust almost at a touch: it is probable, that the bodies were originally placed on the bench. There are proofs that it was customary with the Gauls to place their dead in that form in cells; and that they added to the head of each body a stone weapon, which served as a pillow; but nothing of the kind was discovered in this sepulchre. The diameter of the incumbent cairn is from ninety to a hundred feet. This seems to be that which Mr Rowland takes notice of in his Mona antiqua.” Pennant’s Tour in Wales, vol. iii. See Barrows. (g)

CAIRO, or, as it is often called, GRAND CAIRO, the chief city of Egypt, stands on the right or eastern bank of the Nile, a few leagues above the commencement of the Delta. The body of the town is distant about half a league from the river; and situated in the entrance to that immense plain, composed of alluvial soil, which here suddenly spreads out from the Nile, and comprehends the whole of Lower Egypt. Towards the east of Cairo stands the citadel, built on a lofty rock in the neighborhood of a mountain called Mokaddem; about a mile to the west stand the ruins of Boulaç, lately the flourishing port of Cairo; and at the same distance up the river is situated the populous suburb of Fostat, formerly the capital of all Egypt. Cairo, “the queen of cities,” and the boast and ornament of the East, was founded, according to the Oriental writers, in the tenth century of our era, by Moaz, the first Fatemite caliph, who called it El Kalib, or victorious, in commemoration of his conquest of Egypt. This prince having soon after transferred his seat of empire from Barbary to Fostat the Egyp-

* We have some suspicion, that these Travels are of home manufacture, though the Edinburgh Review does not question their authenticity, nor express any doubts as to the facts above mentioned. On the contrary, it affirms such monuments to be common.
CAIRO.

The capital, made Cairo, in the vicinity, his place of residence, where he had a magnificent palace. After this period, if we may believe the same authorities, Cairo for the space of 200 years consisted of little more than gardens, barrack for soldiers; and the houses of a few grandees till in the 13th century, the victorious Christians, who had invaded Egypt, gave a sudden impulse to its augmentation. Having taken Alexandria, and a number of other places, these formidable crusaders directed their march upon Fostat; but the Saracens, in the hope of disappoint- ing their avarice, had already set their capital on fire, which continued to burn for fifty-four days. The town being thus reduced to ashes, the miserable pop- ulation sought refuge in Cairo, which from that time became the chief city, and now began to be known by the title Masr, or capital, which formerly was applied to Fostat. The Europeans, not understand- ing this circumstance thoroughly, speak of an old and a new Cairo, instead of old and new Masr. Masr, or Mear, seems a relict of Mizraim, the ancient name of Egypt.

Soon after this event, the famous Saladim, elevated to the throne of the Egyptian Sultans, became a great benefactor to the new city; for he not only adorned it with mosques, a univeristy, and other public edifices, but rendered it a place of great strength. He entirely surrounded Cairo with a wall, three leagues in circuit, which is still almost entire; built, or at least strengthened, the citadel, and beautified the town with a great number of gates, one or two of which are the admiration of travellers for their simple magnificence. About the beginning of the fifteenth century, Cairo was one of the richest and most flour- ishing cities in the world. It still preserved some re- mains of its ancient learning, it was the common storehouse of European and Asiatic merchandise, and its commerce extended from the pillars of Her- cules to the remotest regions of India. The subse- quent decay of this amazing city was occasioned by two concurrent causes,—the conquest of Egypt by the Turks, the mereless enemies of learning and of industry, and the discovery of a passage to India by the Cape of Good Hope. Among the interesting particu- lars connected with the history of Cairo, we cannot forbear reminding the reader, that here, in 1801, a British force took a whole army of French prisoners, and sent them back to their own country laden with the curses of an outraged population.

Cairo is still of prodigious extent, being, accord- ing to Volney, equal in size to Paris. The town itself, independently of its suburbs, is above an hour's walk in length, and its circumference more than nine miles. Its general figure is that of an immense cres- cent, winding round the bottom of the citadel. The general appearance of the capital from the Nile, is brilliant in the extreme. Sunk amidst the innumerable hillocks of rubbish, which have been accumulating in its vicinity for ages, the humbler buildings are concealed from the view; while the more lofty edifices, the citadel, and countless minarets, rising out of the gay foliage of the garden trees, present a noble spe- cimen of Egyptian scenery. On a nearer approach, however, the illusion in a great measure vanishes. Its environs are disfigured by mounds of filth and rubbish already mentioned; and the multitudes of tombs, together with the stench of the common sewers, excite disagreeable sensations. Like all oriental cities, which are still what they were five hundred years ago, you perceive on entering it but an irregular assem- blage of dirty hovels, or rather masses of villages, crowded and huddled together in the greatest con- fusion. The streets are extremely crooked and nar- row; and as they are not paved, the crowds of men, camels, horses, asses, and dogs, which are continually bustling through these narrow passes, keep up an in- cessant atmosphere of dust. It is a singular circum- stance, that the streets are overrun with wild dogs, while clouds of hawks and pigeons are flying above. The principal streets of Cairo run generally from north to south, parallel to the great canal which in- tersects the town; and the lesser from east to west. These last, many of which have no thoroughfare, communicate with a main street, which extends the whole length of the town, and is lined on both sides with shops, crammed from top to bottom with all kinds of merchandise. The houses, crowding often into groups, large vacant spaces intervene; and these, to- gether with the numerous courts and gardens includ- ed within the walls, are, during the inundation of the Nile, converted into lakes; so that what is covered with flowers and verdure in April, is in September sailed over in boats.

The houses of the poor are built of mud, or unburnt bricks dried in the sun, and are only one stor- ry high; those of the better sort of inhabitants are composed of a soft stone brought from Mount Mok- kadem; and, contrary to the common practice in the East, consist of two and sometimes three stories, hav- ing all flat roofs, or terraces of stone or tiles. The houses here being wisely calculated for defence, the ground floor is either a shop, or has no windows towards the street. The upper windows, and those which look towards the court behind, are generally latticed; many are to be seen with paper, while some of the rich indulge in the luxury of glass. The houses of the beys and grandees are large and con- venient structures, being in the form of a square, with a court or garden in the centre; around which are ranges of apartments for the different de- scriptions of the numerous inmates and domestics; but being surrounded with high dead walls, these edifices contribute nothing to the decoration of the streets. The gardens, which occupy the area of these courts, are well stored with trees of the most grateful and picturesque appearance, such as the palm and the sycamore; and these, together with the waterworks and basins, constructed of the finest marble, produce a feeling of coolness and refreshment extremely agreeable in this scorching climate.

Cairo abounds with large and sumptuous reser- voirs for supplying passengers with water; and the number and elegance of its baths are no where surpassed. The okals, or warehouses, in which whole- sale commodities are kept, are remarkable for their size and strength; and are also convenient and clean—uncommon qualities in this country. The bazaars, too, or retail market places, are very exter-
five buildings, containing many covered stalls, or shops, for the different commodities; for each kind of which there are appropriate quarters. But the greatest ornament of this city are its mosques, or Cinema, of which there are upwards of three hundred within the walls. All these edifices being adorned with minarets or lofty steeples, of the lightest and most ornamented architecture, agreeably interrupt the uniformity of the flat-roofed houses, and are so numerous as actually to appear at a distance like the masts of ships in a crowded harbour. These minarets are surrounded, at a great elevation, with projecting galleries, in which stand the public eriers, who announce the stated times of prayer prescribed by the Mahometan law. Upwards of eight hundred voices may be heard at once from these lofty stations. It is said that the jealous Mahometans compel these eriers, by an oath, to keep their eyes shut while above, lest they should look into any of their harems; but that as a better precaution, they generally select blind persons for this office! Among this multitude of mosques, several are remarkable for their elegance and soliman. The most magnificent is the mosque of Sultan Hassan; next to it is the mouristan, a famous hospital for the insane, the sick, and the blind, where fourteen thousand persons are said to receive support at the public expense. Not far off is another noble structure, the mosque of flowers, in which there is an academy or college. This building, at the same time that it is a master-piece of oriental decoration, and splendidly adorned in the interior with marble pillars and Persian carpets, is so remarkably strong that the Beys have sometimes mounted it with cannon, and dislodged the pacha from the citadel. Here is a considerable collection of manuscripts; but the only branches of learning taught are a sort of wretched theology, grammar, and astrology, in which the Mahometans are great believers. The interior of these mosques is in general fitted up with the greatest simplicity. The pavement is commonly covered with mats, seldom with carpeting; while the walls have scarcely any other ornaments than some passages of the Koran written in letters of gold, together with a vast number of plain lamps suspended in horizontal rows. In the middle of the city, the Greeks have a large church dedicated to St Nicholas. Here also the Armenians have one, and the Copts, or native Christians of the Coptic sect, two. Their patriarchs, and that of Alexandria, of the Greek persuasion, have their residence in the street called Harte-Room; and in another called Juwaria, resides the Archbishop of Mount Sinai, who, though he always lives at Cairo, is not a suffragan of the patriarch of Alexandria, but of that of Jerusalem. As the doors of these convents cannot be opened without paying an enormous tax to the Arabs, the entrance is by a window, to which you are hoisted up in a basket. The Jews also have a synagogue near the Greek church.

The citadel forms a noble object. It is situated on a rock of considerable elevation, and is about three miles in circumference; it is entered by two gates; you ascend to the higher by a steep approach, paved with large flag stones, through piles of ruined houses, lately destroyed in the fray between the Turks and Albanians, till you arrive at the foot of the walls, which are lofty and strong. As a fortress, however, the citadel is chiefly calculated, since the invention of gun-powder, to overawe the town, being commanded by Mount Mokaddem, a range of barren and naked rocks in its vicinity. The French engineers, according to Lord Valentia, wished to remedy this inconvenience by blowing up the commanding eminence, a design certainly practicable though of great labour; but Bonaparte would not consent to a measure which had not originated with himself. All travellers agree in stating the view from the ramparts to be incomparably magnificent. You survey the whole of Grand Cairo, with all its gardens, fountains, squares, palaces, mosques, and minarets, stretched out at your feet, the ruins of Boulaq, the populous town of Fostat, the grand aqueduct, the broad majestic stream of the Nile interspersed with verdant islets, the village of Geza on the opposite bank, and those extensive monuments of human skill and folly—the pyramids. Though at least twelve miles off, the courses of stones of which the pyramids are composed, together with the head of the sphinx rising out of the sand, are perfectly distinguishable by the naked eye; so enormously great are these masses!

The old and new citadels were formerly separate; but the French, having opened a communication between them, in a great measure converted them into one. All the objects of curiosity are contained in the new. This fortress, in which there is a very handsome place d'armes, is divided into three parts; the first contains the pacha's palace, the second the quarter of the Janissaries, and the third those of the Azabs. The palace has little to recommend it but its great size. Formerly it was splendidly ornamented, when occupied by the sovereigns of Egypt; but now that it is intrusted to the Turkish pachas, who are frequently changed, they take no interest in keeping in repair this vast structure. They even no longer reside in the citadel, but in a large house in the town; using only a ruinous apartment in the palace as a divan, or council room. All the buildings in this quarter are in ruins, except those connected with its defence. The barracks of the Janissaries are very strong, and resemble an old European fortress with high walls and towers.

This citadel contains several splendid remains of antiquity. Near the quarter of the Azabs, is that truly wonderful specimen of ancient art, Joseph's well. This enormous pit, dug all the way through the solid rock, is sunk to the depth of 276 feet. At the mouth, it is an oblong square of twenty-four feet by eighteen; being eighty-four feet in circumference; which dimensions are regularly preserved to the depth of 146 feet from the surface. Here is a stage or floor in the well, from the middle of which, as it were, another well descends, of only fifteen feet by nine. This second shaft is continued 190 feet more, still through the rock, and terminates in the bed of gravel on which the mountain reclines, beneath the level of the Nile. A stair-case of gentle descent, cut in the rock, winds round the pit, with a thin partition
left between it and the well, in which a few windows give a scanty light. In the lower division this precaution of a partition is omitted, and the descent is of course perilous in the extreme. The stage or floor in the middle of the well serves a valuable purpose. It contains a large basin, and affords sufficient space for three ozen, that here raise the water by means of a wheel; this water is poured from the string of small buckets connected with the wheel, into the basin already mentioned; from which it is again raised in the same way, by other ozen moving round the mouth of the well. This stupendous excavation, it is unnecessary to add, is attributed by the vulgar to the patriarch Joseph. Some have supposed it to be the work of Saladin, whose real name was Joseph, or Yassuf. For our own part, we are disposed to consider it as the work of a people much more scientific than the Saracens, and worthy of the same engineers who erected the pyramids. If this was really the site of the Egyptian Babylon, which is the opinion of many antiquaries, we cannot well suppose such a strong place to have been at the mercy of an enemy for water. Strabo, indeed, describes the water of Babylon as being raised by manual labour from the Nile. But this also is the case at Cairo; for though the water of the well probably proceeds from the Nile, yet percolating through sand impregnated with various saline substances, it is brackish; for which reason fresh water directly from the river is conveyed by an aqueduct to the foot of the citadel, whence it is raised to the castle by machinery. The tower of lights near Fostat, which Savary, after Pococke, contends is the real Babylon, is totally dependent on the water of the Nile, and therefore could never have been a place of great strength; whereas, that of Cairo prefers indeed the river water, but has, in case of necessity, an abundant supply within itself, and a well which bears every mark of the remotest antiquity.

In the citadel is also Joseph's palace, an uncommonly fine building, exhibiting precious remains of its ancient magnificence. The great hall, so much celebrated by all travellers, and of which the reader will find a handsome engraving in Lord Valentia's Travels, is truly admirable. On four gigantic pillars of red granite, four elegant arches of Saracenic architecture recline, which formerly supported the roof. The capitals of the pillars are Egyptian, and belonged to a more ancient building. Another grand apartment is adorned with numerous pillars of granite, each of a single piece; all of these except four, which have Corinthian capitals, are in the Egyptian style, and are evidently the spoils of prior ages ingeniously combined by the industrious, though far inferior, hands of the Arabs. Opposite to this room is another, which commands a view of the whole city and neighbourhood. Here were woven and embroideried with gold, the rich green hangings, and the black covering of the Caaba, annually sent to Mecca by the grand signior. The walls of this apartment, now filled with ruins, were covered with figures in exquisite mosaic, part of which still remains; as were those of a neighbouring room, with handsome paintings, and the names of the ancient sovereigns of Egypt.

Another object of attention in the castle, is, the mint, the only one in all Egypt. Here the gold dust and silver ore, collected on account of government, in Africa and other places, are converted into coin; the gold into mahboobs, zingerlys, and funduklys, respectively of the value of 6s. 10d., 7s. 7d., and 9s. 6d.; the silver into pieces of one, five, ten, fifteen, twenty, thirty, and forty paras; the value of the para being about three farthings of our money. The scandalous adulteration of these coins is a source of immense profit to the government: when the people murmur, some cannon are pointed at the town, which give instant currency to the money. On one side of the coin is the name of the reigning sultan, on the other is Masr, and the date. The machinery for striking the coin is similar to that employed in all the European mints before the invention of Mr. Bolton. Instead of flattening the metals by means of rollers, they beat it out with hammers.

The number of tombs in the neighbourhood of Cairo is enormous. All the different races of men have distinct burying grounds. The English are buried with the Greeks. The tombs of the sultans and of the Mamelukes are of white marble; and these immense cemeteries, crowned with domes and minarets and gilt pavilions, are much more magnificent than the shrines of the living. This Necropolis, this city of the dead, is a little to the east of Cairo, without the walls.

About a mile to the west of the city, on the right bank of the Nile, stands the once flourishing and populous town of Boulaq. This being the principal port of Cairo, it formerly presented a scene of perpetual bustle and activity. All the various commodities brought up from Rosetta and Damietta, as well as those from Upper Egypt, were brought in here in an infinite number of vessels of all descriptions; here was the capital custom-house of Egypt, together with an immense bazar, in which there was a perpetual market. The magazines of rice, salt, nitre, and several productions of Upper Egypt, were also established in this town, including the large granary of the sultan, whence he sent an annual supply of corn to the sacred cities of Mecca and Medina. This town, however, we understand, is now a melancholy monument of French barbarity. Having joined Cairo in an insurrection against these oppressors, this unfortunate place was entered by storm, given up to be pillaged for three days by the French soldiery, and finally burnt to the ground.

Fostat, otherwise called Masr-el-atik, or Old Masr, improperly by us called Old Cairo, though greatly decayed from its ancient grandeur, is still a considerable town, being half a league in extent. Its ruinous citadel, chiefly inhabited by Christians, contains a large convent of Greek monks, who used to accommodate with lodging and provisions, the numerous visitors from Cairo, attracted hither in the hot months by the salubrity of the air, the vicinity of the river, and the pleasant groves of the isle of Rhoda; but of late the cruel exactions of the Albanians have compelled these industrious fathers to shut up their convent, and retire to a smaller building. Fostat contains three custom-houses, for the trade of the Said, and the famous magazine called Joseph's Granary, where is still deposited the corn of the Thebais, des-
tined for the provision of the troops. Here is the
great church of St Macarius, in which the patriarcb
of the Copts is installed; the church of St Sergius
contains a cavern held by the Christians in great ve-
neration, as being the retreat of the holy family du-
ring their abode in Egypt.

At the entrance of this town, commences the great
aqueduct in a hexagonal building, each side of which
is eighty feet wide, and one hundred high. Oxen
go up a very gentle ascent, and turn a wheel, which
raises water from the Nile to the top of the building.
From a reservoir stationed here, it flows into the
aqueduct, and is thus carried to another reservoir near
the castle: there it is raised a second time by several
wheels to the palace of the pacha, for the supply of
the garrison. The aqueduct is a handsome structure
of rustic work, supported by three hundred arches,
and is said to have been built by the Arabs in the
sixteenth century, in imitation of a similar work now
in ruins, which supplied the citadel of Fostat.

Near this place, too, begins the great kalige or
canal. Diverging from the Nile at a pretty sharp
angle, it proceeds down towards Cairo, divides that
city into two portions, filling in its passage all the
ponds, reservoirs, and private canals of the place, and
empties itself some leaues to the east in the Birque,
a lake surrounded at present by the villas and plea-
sure-houses of the rich, and famous as the rendez-
vous of the pilgrims of Mecca. The extent between
the Nile and the Birque forms but a small portion of
this stupendous canal. It once communicated with
the Red Sea; and vessels laden with the productions
of Egypt traversed the burning desert. This work
is ascribed by Savary, on the suspicious authority of
the Arabian writers, to the caliphate of Omar, whose
dominions at home being afflicted with famine, he
is said to have commanded Amrou (who had just con-
quered Egypt; and burnt the library of Alexandria)
to "dig a kalige," for the conveyance of grain.

Hence this canal is styled by the Orientalists, "The
River of the Prince of the Faithful." But our best
antiquaries ascribe it to the emperor Trajan, calling it
by the name of Amnis Trajanus, a canal mentioned by
Ptolemys; and indeed it appears to us infinitely
more likely to be the work of a Roman emperor,
than of a sanguinary horde of barbarians in the me-
ridian heat of their religious fanaticism. This canal
is certainly of great utility to Cairo and the neigh-
bourhood, as it fills the reservoirs within and without
the walls, and thus ensures a supply of water for house-
hold purposes, and for the irrigation of the lands.
It is accordingly cleaned very carefully every year for
the reception of the flood, and for some time is used as a
street. This operation, however, being delayed as long
as possible, to prevent a fresh accumulation of obsta-
cles, the canal remains for six months after the recess
of the water in a most horrible condition. The quanti-
ties of filth which it then daily accumulates, pre-
vent its being dried by the heat of the sun within
the city; and the detestable smell which is produ-
ced, during the hot season, from this putrid mass of
stagnant water, soil, and dead fish, which are here
and there in great quantities by the Nile, infects the air,
and, as some have conjectured, gives rise to the
plague. It must be observed, however, that many
of the best houses are built on this canal, where also
is the quarter of the Europeans. During the influx
of the inundation it is extremely pleasant, and pre-
sents a splendid exhibition of Egyptian fashion, be-
ing covered with parties of pleasure in their light skiffs
and gilt barges, regaled with every species of music,
and enjoying, in the midst of thousands of spectators,
who at this time crowd their terraces and windows,
the refreshing coolness of the recent flood.

Between Fostat, on the right bank of the Nile,
and Geza, a small village on the opposite side, is the
island of Rhoda, a pleasant spot in the middle of the
river, about a mile in length, and entirely covered
with large sycamore trees, and the most lovely ver-
dure. The southern extremity of this island is forti-
ified with bulwarks of the strongest masonry, to re-
sist the force of the current. Over this breast-work
is erected the building which contains the celebrated
Nilometer, called Mekias, an accurate engraving of
which the reader will find in Pococke. This water
gauge, which has been visited by every traveller into
Egypt, consists of a very superb marble pillar with a
Corinthian capital, rising out of the centre of a ba-
sin, which has a communication with the Nile; and
being accurately graduated to the top, exhibits the
quantity of increase or diminution in the height of the
river. Over the pillar is built a magnificent
dome, supported by columns placed round the basin,
and the whole is surrounded by the ruins of a great
palace. It is unnecessary to remind the reader of the
importance attached by the Egyptians to the annual
overflowing of the Nile. As little or no rain falls in
that country, the crops depend entirely on artificial
irrigation; and when the waters of the Nile do not
fill the canals and reservoirs, called birques, as well
deposit on the fields its fertilizing slime, vain are
the labours of the husbandman. The Egyptians ac-
cordingly have, in all ages, assiduously watched its
progress, and ascertained its quantity by a nilometer.
The present mekias is above nine hundred years old.
As soon as the river has begun to rise, its daily in-
crease is watched by an officer, who continually
transmits his report to Cairo, where it is proclaimed
and received with the utmost eagerness. When it
has risen to the desired height, about sixteen cubits,
and the people have paid to the grand signior the
tax for the use of the water, the pacha, attended by
the boys and the whole of the court, goes in grand
procession from Cairo, to be present at the opening
of the great canal, which we have already described
as intersecting that capital. Upon a signal given by
the pacha, the workmen immediately open the mouth
of the canal, which till now has been kept shut, and,
as the water rushes into it, handfuls of silver are
thrown into the stream by the nobility, by which
means a most amusing aquatic scramble is produced
among the populace, who dive for the money. At
the same instant, multitudes of people in thousands
of boats, and decked in their gayest attire, are eager
to glide into the canal, and with the sound of vocal
and instrumental music testify their joy on the occa-
sion. The pacha, at the same time, going on board
his magnificent bark, accompanied by the whole of
his attendants in their barges, returns by water to
Cairo in the same order of procession as he had gone
CAIRO.

The population of Cairo is composed of a great many different races. The most numerous class are the Arabs, who constitute the body of the people. The other races are the Copts, who are Christians, and are the original people of the country, Albinians, Mamulukes, Turks, Jews, Syrians, Armenians, and Greek and Roman Catholic Christians. Besides these, there are Persians, Indians, Muggrebins, or western Africans, Abyssinians, and individuals of almost every nation under the sun, together with multitudes of negro slaves. To many of these races distinct quarters of the city are assigned, particularly to the Jews, Muggrebins, and Europeans. The amount of this mixed and motley population it is impossible to ascertain, as the Mahometans neither keep registers, nor permit a numeration of the people. Some have stated it so high as 700,000, asserting that in one season 300,000 have been swept off by the plague; while others reduce it to 250,000 souls. Niebuhr justly contends, that the immense circuit of the town is no criterion of its population, containing as it does so many vacant spaces of canals, gardens, reservoirs, mosques, and public edifices, not to mention the lowness of the houses, which are, in general, but one story high; so that the population cannot by any means be supposed equal to that of a European city of the same extent. Browne, however, thinks it cannot be less than 300,000. The dress of the common people is simple, and adapted to the climate. The men wear a shirt of coarse calico, which hangs down to the knees; above this they have another larger and longer, of a blue, or rather black colour; and the addition of a broad leathern girdle completes the body dress. Their legs are bare, their feet sometimes protected by coarse shoes of untanned leather, while their heads are covered with a red cap, wound round with a piece of calico. The women are dressed much in the same style, but without the girdle and shoes; the most remarkable difference consisting in an ugly thick veil, which entirely covers the face and breast, with two holes in it, opposite the eyes, to see through. This piece of dress, together with the brown arms and ragged drapery of the Egyptian women, gives them somewhat of a hideous appearance in the eyes of a European. The people of condition, particularly those in any office, are remarkably gorgeous in their dress, and affect a good deal the Turkish costume. There is no place in the world where the traveller meets with a more remarkable contrast in point of condition than in Cairo; splendid palaces in the midst of mud hovels; horsemen clad in the most costly apparel, with their horses magnificently caparisoned, rushing through crowds of squalid wretches, emaciated with famine, and fluttering with rags.

The women of Cairo are upon the whole well formed, though not tall. Those of the upper ranks sometimes rival in point of complexion our European ladies; and this quality, in conjunction with fatness, constitutes the perfection of Egyptian beauty. They marry at the age of 14 or 15, and at 20 are already past their prime. The Coptic women are remarkable for their interesting features, black eyes, and genteel form. "The female Greeks born in Egypt," says Lord Valentia in his description of Cairo, "are pretty fair, and well made, when young; but child-birth destroys their figures by relaxation, and their bosoms become large and flaccid. Their head dress is Asiatic, and richly adorned with gold, pearls, and diamonds; their robes are of the same style, and consist of satins and velvets, faced or lined with fur. Unfortunately in the same proportion in which the outside is adorned, the inside is neglected." The female love of finery is here so excessive, that, according to Niebuhr, the ladies retire, several times, from the same company, to appear again in a new dress, still more splendid than the former. The following sketch by Lord Valentia is no less descriptive of the Mahometan ladies of the Harem, than it is of the other ladies of Cairo. "In the morning I returned Mr Macardle's visit, and accepted an invitation from him to be present in the evening at an Egyptian dance. I went, but was not amused. The dancers were veiled, not from modesty, but to conceal their ugliness. They were somewhat in the manner of the Indian nautch girls, but never raised their voices to an artificial pitch. The dances were infinitely too indecent even for description. Mrs Macardle, a pretty Greek, and a great number of ladies, were there; none of them seemed the least discomposed; but, on the contrary, laughed excessively; yet unquestionably this was by no means the effect of vice, but solely of habit, which had rendered the scene so familiar, that they did not perceive its impropriety, and even when asked, danced themselves in as indecent a manner. In the intervals the dancing girls went round, demanding money from each person." The dancing girls here alluded to, called almeh, are those who make a profession of dancing, singing, and relating tales for the amusement of company. Their gestures and songs are to a European disgusting in the extreme, and the frantic movements to which they are sometimes excited by their own ideas, with the help of brandy, make them no bad representatives of the ancient bacchantes. These are the governesses at Cairo who instruct the wretched wives of the Mahometans, and teach them in their Harems, with great assiduity, those accomplishments in which they themselves are so infamously eminent. The lower orders also have their almeh, who are, if possible, still worse than the former.

Life, at Grand Cairo, partakes largely of that indolence which characterizes the manners of warm climates. For nine months in the year, the body is oppressed by heat, and the mental faculties experience a corresponding languor. Hence it is, that you everywhere find sofas, cushions, and every convenience of repose: in every garden you have charming arbours and seats, but no walks; and tobacco, coffee, and sherbet, occupy the dreaming intervals of sleep. An Egyptian rises with the sun to enjoy the cool air of the morning; and having performed his ablutions and devotions, he receives his pipe and coffee, reclining indolently on his cushions. At the farther end of the apartment, his slaves, with their arms crossed, stand in silent attention before him, watching his eye, and anticipating his smallest wants.
After breakfast, visitors arrive. His equals are placed beside himself, with their legs crossed; his inferiors, in a kneeling posture, sit upon their heels; whilst those of very high rank are seated on a raised sofa overlooking the company. Towards the end of the visit, a slave goes round with a silver plate, in which odoriferous essences are kept burning; each in his turn perfumes his beard, and sprinkles his head and hands with rose water. About noon dinner is announced; which is served in a large tray, and consists chiefly of rice and poultry, with melons, cucumbers, and other refreshing fruits. The guests arranging themselves round the table, sit down on the carpet, and convey the morsels to their mouth with their fingers, the use of knives and forks being here unknown. To remedy this inconvenience, a slave, with a pitcher in one hand, and a basin in the other, is ready to present water, in which the guests occasionally dip their hands. After dinner, a rich Egyptian retires to his hareem, where he passes some hours in sleep or amusement, among his women and children; afterwards, a short walk among the orange and sycamore trees, which grow in great luxuriance on the banks of the Nile, occupies part of his time in the cool of the evening; and about an hour after sunset, supper appears, consisting chiefly of rice and fruit.

The people here are extravagantly fond of the bath. The women, eagerly seizing on every moment of liberty which they can command, meet in parties twice a week at the baths, when they make an ostentatious display to each other of their finery. In Cairo is practised, in its greatest perfection, the bathing operation, called massing: this luxury consists in having your body rubbed all over by servants, who at the same time knead and press the limbs and joints till they crack, after being exposed to the hot or vapour bath. Europeans have described, in terms of rapture, the sensations which they have felt after this operation; though too frequent indulgence, we should suppose, must relax and debilitate the body.

At Constantinople, and other oriental cities, the ladies have it in their power to take an airing in carriages; here, however, nothing of the kind is known; so that women of all ranks are obliged to ride asses, which are to be had in great numbers, saddled, bridled, and ready in the streets. A Jew or a Christian dares not ride a horse in this metropolis of pride, that being thought too great an honour for any but true believers; and if he do not alight from his ass immediately, on seeing a bey, or great man pass by, he is certain of being bastinadoed on the spot. The Christian and Jewish ladies, however, are exempted from this homage, out of regard for their sex.

One of the greatest sources of recreation here is the Nile, on which hundreds of elegant boats, with their long sail-yards and fantastic sails, are seen flying with great velocity in all directions. They are ingeniously carved and painted, and, being fitted up with fine cabins, carpeted over, afford a delightful shelter from the heat. Here, reclining in luxurious ease, the wealthy, sometimes accompanied by their whole harems, enjoy the delicious coolness of the water, and admire the ever-varying landscape presented to their eyes, as they pursue the frequent windings of this renowned river. Pedestrian parties are also seen frequently promenading along the banks, which are here adorned with a profusion of orange trees, the citron, and the pomegranate, planted without order, and growing high and tufted: these, together with the palm and the sycamore, towering above the rest in all the magnificence of their dark-green foliage, afford an agreeable retreat from the dust and noise of the city, and from the fierce effulgence of an almost vertical sun.

The other amusements of Cairo are neither numerous nor interesting. Rope-dancers, fire-eaters, and tumblers of surprising agility, serve to amuse the populace. There are also to be seen some wretched actors, puppet-shows, and dancing monkeys; these last being dressed, to make them the more ridiculous, in European habits, with their tails hanging down like swords, excite the merriment of the people at the expense of the Franks, who are here held in the utmost contempt. Fire-works are sometimes displayed on public occasions. The principal games are polish drafts and chess.

Though the diseases of Cairo are common to all Egypt, they are perhaps aggravated by local circumstances. The mean annual heat here is 78°, and is not a little increased by the vicinity of mount Mo-kaddem, a dry naked rock which overlooks the city, and powerfully reflects the rays of the sun. This circumstance, together with the white glittering sand which every where covers the soil, produces delusions in the eyes, often terminating in blindness. The other prevalent diseases are, a cutaneous eruption, proceeding, it is supposed, from the use of brackish water, but not much affecting the health; a virulent small-pox, malignant fevers, hydrocele, and venereal disorders. These last are said to be here rendered mild by the frequent use of the hot bath; though, at the same time, they are extremely obstatit, and often prove dangerous on removing to a colder climate. The frequency of hydrocele is ascribed to these, and to the relaxing qualities of the hot bath: Denon thinks it is often produced by drinking brandy distilled from figs, or the fruit of the sycamore tree. From the filth, poverty, and famine prevalent among the lower orders, the diseases of the place are certainly not a little exasperated; and to the same causes it is owing, that there are a greater number of deformed beggars, and emaciated sickly children, to be seen here than in any other city in the world. But of all the calamities and diseases to which Cairo is subject, the plague is undoubtedly the most terrible. It is not yet ascertained whether this scourge of the East originates in the niloth of Cairo, or is imported from Constantinople. It generally rages in Egypt once in every four or five years, and continues only during the winter season, when it has been known to sweep off 1500 souls a day from the population of Cairo alone. It is remarkable enough, that the Europeans, who reside on the very banks of the canal, are less subject to it than the natives. Their cleanliness, however, and the precautions which they adopt, sufficiently account for this circumstance; for no sooner does the plague appear, than they shut themselves up in their houses, often for several months, fumigating or wash-
ing the articles conveyed to them from without, and carefully avoiding the contact and near approach of persons exposed to the infection. It would appear, that the pestilential atmosphere possesses a considerable specific gravity, as it is not found to ascend so high as the tops of the houses; where the Europeans freely appear, and survey, in security, the havoc of death in the streets.

In favourable seasons, provisions of most kinds are here very cheap; wine, sweet oil, and fuel, which is used only for cookery, being the produce of foreign countries, are rather dear. Onions still continue to be prized in this place, of which immense quantities are consumed raw by the poorer sort. The well-water of Egypt is for the most part brackish, as is also that which has stood for some time in the canals and reservoirs. On this account, the water drank at Cairo, except during the inundation, is brought in leathern bags from the Nile, on the backs of camels. Being commonly very muddy, it is poured into large earthen jars, previously coated on the inside with a preparation of bitter almonds, and, in the space of two hours, it becomes pure and limpid. Besides sherbet, which is used chiefly by the great, a fermented liquor, pleasant but soon spoiling, is here obtained from maize, millet, barley, or rice. The Christians distil for themselves, from dates, figs, or currants, a strong liquor known by the name of ara-ki. The peculiar complexion of the diseases of a people, is produced, we venture so say, more by the qualities of their food, and their mode of living, than by climate.

The government of Cairo is vested in the bey of Maar, assisted by the mulla, or chief judge and priest, who is annually appointed by the grand seignior. The inferior judges, called cadis, amount, in this great city, to 200: their revenue consists in the value of the tenth part of the thing litigated. Besides these, there also are imans, or priests of the four sects, who exercise authority over their respective adherents. Notwithstanding the great extent of Cairo, its narrow and winding streets, and its barbarous population, fewer deeds of violence are committed here than in some European cities. For this security several causes may be assigned. Every calling here has a sheik, or chief, who keeps an eye on the members of his own fraternity; by which means, a police is established in every craft, and criminals are easily detected. The streets, too, having generally no thoroughfare, and being at night shut up with gates, prevent the possibility of escape. These gates are opened by a porter, who allows none to pass of a suspicious appearance; and, to insure respect, a guard of janissaries is within call, who, being liberally paid by the town, and never changed as long as they give satisfaction, have thus a powerful stimulus to discharge with fidelity their lucrative office. But, besides these preventive measures, the execution of justice is here prompt and terrible. The judges are constantly sitting. Officers, with a numerous posse of attendants, perambulate the streets by night and by day. The punishment of the bastinado is applied with unsparring vigour on the spot; and sometimes, when the wretched offenders are detected in the commission of great crimes, their heads are instantaneously struck off, and are received into a leathern bag carried about for that purpose. With such a form of government, it is obvious that the rulers must commit more crimes than the people.

Under the despotism of the Turks and Mamelukes, it was vain to look for excellence in arts or manufactures. In the furniture of houses, and decorations of silver and gold, there is much grandeur and barbaric parade; but throughout the whole, there reigns a poverty of invention, and a miserably bad taste. The most perfect of their manufactures is that of silk stuffs, which is, however, inferior to the European productions, and much higher priced. Their other manufactures are sugar, of a bad quality, obtained from the canes, which in some places cover the banks of the Nile; sal ammoniac, which is much in request; saltpetre, coarse gunpowder, glass lamps, red and yellow leather, and linen cloth of fine Egyptian flax. Their gun and pistol barrels, sword blades, hard ware, and mercery, are the produce of foreign manufacture. The carabines of the Mamelukes are English, and their swords Persian or Turkish. We might here mention the hatching of eggs by artificial warmth, a very ancient art, and at present retained principally at Cairo. The chickens are thought by some not to be so good as those hatched by incubation.

The commerce of Cairo with distant places, though much decayed within the last three centuries, is still very considerable. As the metropolis of Egypt, the residence of the bey, the laws, and the wealthy, it consumes all the commodities of that country, or transmits them to the provincial districts; as a centre of circulation, it affords great facilities from its position. By the Nile, it corresponds with Upper Egypt and Abyssinia; by the Mediterranean, with Europe and the Turkish empire; by the Red Sea, with Arabia and India; and even by the deserts it communicates with distant countries by means of numerous caravans. Damascus and Cairo are called "the two gates of Mecca," from the annual muster of pilgrims which take place at these two cities, though we are uncertain what changes the Wachabees may have produced in this respect. Of these prodigious assemblages, the greater part are merchants, who avail themselves of this religious opportunity to conduct their traffic. Every year a great caravan from Abyssinia arrives in the neighbourhood of Cairo, on the banks of the Birqe, or Lake of the Pilgrims, bringing from 1000 to 1200 negro slaves, great quantities of elephants teeth, ostrich feathers, gum, gold dust, parrots, and monkees; and here it remains till joined by another immense assemblage from western Africa. These pilgrims and merchants, some of them from the Senegal, proceeding along the coast of the Mediterranean, and collecting in their way those of Algiers, Tripoli, and Tunis, arrive through the desert at Alexandria, and from thence proceed to the general rendezvous at the Birqe. This caravan has been known to exceed three thousand camels, laden with the merchandise of the West, consisting of oils, red caps, for which Tunis is famous, fine flannel, and many other commodities. This multitude being now incorporated with that from Ethiopia, and swelled by the crowds of Egypt, the whole
Cairo to Caithness.

Cairo is set out for Mecca, under the orders of the sheik Bellet of Cairo. This high officer has in charge the presents of corn and money from the Grand Signior, together with the precious covering for the caaba. After a period of one hundred days, this great caravan, to the number, on some occasions, of 100,000 souls, return in a body to the same place with the choicest productions of the East. These consist principally of coffee, perfumes, gun arabic, and other drugs, the produce of Yemen, with spices of Ceylon, shawls of Cashmuire, and muslins of Surat and other parts of India. The same commodities are also brought by sea from Jeddah to Suez, where near thirty vessels annually arrive in May. There are, besides, many smaller caravans to and from Cairo, particularly one in October, from the neighbourhood of Mount Sinai. These Arabs are extremely expert at adulterating their gum, which they convey to the amount of 700 quintals, for which reason they cannot be prevailed on to enter Cairo. They encamp at a distance, and dispose of their goods by barter, receiving arms, clothing, and other necessary articles in return. The small caravans from Damascus bring silk, cotton stuffs, and dried fruits. Immense quantities of tobacco, which has become one of the necessaries of life at Cairo, are constantly landing at Damietta by vessels from Latikia, which take in exchange cargoes of rice. The vessels from Constantinople, which also return with grain, bring clothing, wrought silks, furs, and arms, into the port of Alexandria; while those from Venice, Leghorn, and Marseilles, bring cloths, cochineal, Lyons stuffs and laces, iron, lead, grocery, together with Venetian sequins and German dollars, which are here imported at a great profit. All these articles are conveyed in lighter, called djemans, to Rosetta, whence they are sent up the Nile to Grand Cairo. Notwithstanding the excessive impotums, and the impolitic exactions of the Mahometans, the commerce of Cairo will appear, from the foregoing particulars, to be still considerable; it is said to have amounted in 1788 to between six and seven millions sterling. There can be no doubt but that the curious career of the Wahabis in Arabia, has considerably affected the external relations of Cairo; and from the bloody and exterminating affrays which have within the last year taken place between the Turks and Beys, its commerce at present must be very precarious. Cairo stands in 30° 21' 44" N. Lat. and 31° 18' 16" E. Long. about 59 geographical miles west of Suez. See the Travels of Shaw, Poocke, Norden, Niebuhr, Savary, Volney, Bruce, Browne, Denon, Sonnini, Chateaubriand, Lord Valentia, and The History of the Revolt of Ali Bey. (2)

CAIISON. See Bridge, Vol. IV. p. 525.

CAITHNESS, sometimes called the shire of Wick, is the most northern county of Scotland, and is bounded on the north by the Pentland Frith, which separates it from the islands of Orkney; on the east and south by the German ocean; and by the county of Sutherland on the west. Its form is an irregular triangle, measuring from north to south about 35 miles, and 23 from east to west, and containing 690 square miles. The coast is rocky, and indented with a number of bays, the principal of which are Scrit-bister bay on the north west, and Rice bay on the east. Its promontories are Duncan's-bay-head, which is the north east point of Caithness, and the extremest promontory in Britain; Sandside-head, Holborn-head, and Dunact head. The island of Stroma, lying in the Pentland Frith, now belongs to this county. Its property was formerly disputed by the Earls of Orkney and Caithness, but adjudged to the latter in consequence of an experiment, by which it was found that venomous animals would live in Stroma, whereas they die immediately when transported to the Orkneys.

The western part of the county is hilly, and even mountainous, and chiefly adapted for the rearing of cattle and sheep; but towards the east, it is almost completely level, and watered with several small rivers and lakes, but without a hill to shelter it from the piercing winds from the sea.

The climate is very cold, and more rainy than almost any other place on the eastern coast of Scotland. The rains generally prevail in spring and autumn, and sometimes do considerable damage to the crops. The snow, however, seldom lies long on the ground, from its proximity to the ocean; but the coldness of the weather during the spring months is a great bar to vegetation; and in the interior of the county, where the soil is rather tender, has a tendency to engender a species of vermin called storer, which destroy the young plants of barley and oats, by cutting the roots below the ground. The longest day in summer is about 18 hours; and the sun makes so small an arch below the horizon, that the inhabitants enjoy a constant twilight from the time he sets until he rises again.

The soil of Caithness, particularly in the Lowlands, is in general a mixture of clay, sand, and brown earth or loam, from six to fifteen inches deep, with a hard gravel, schistus, or horizontal rock, beneath, which has a tendency to keep it always wet, and to obstruct vegetation, especially that of trees. In point of fertility, however, it is equal to any in the kingdom in proportion to its depth, and produces plentiful crops of barley and oats. The best husbandry has been attempted in some parts of the county, but on the whole has not been found a profitable crop, on account of the frequent and heavy rains which fall in October, when the farmer is putting the seed into the ground. Various kinds of green crops, however, are cultivated with success, such as turnips, clover, rye-grass, tares, cabbages, colworts, &c.; and Mr Wright, in his Husbandry of North Britain, has observed, that the richest second growth of clover he had any where seen, was on a farm cultivated by Sir John Sinclair. Considerable improvements in agriculture have been made within the last thirty years, by the proprietors of this county. The wretched system of service, customs, and tithe, exacted by the landlord from the tenants, is now abolished, and the rent of the land is paid in grain or money. By the old mode of letting farms in Caithness, the farmer, besides the payment of a stated rent, was bound to cultivate a certain portion of land in the possession of the proprietor, by tilling, manuring, and sowing it in proper season; by cutting down, gathering in, and securing the crop in the barn-yard;
CAITHNESS.

The black cattle, which were formerly sent from Caithness to the south, amounted in some years to nearly 80,000; but this number has of late been very considerably diminished by the introduction of sheep farming into the upper districts of the county. The swine, which are reared here in great numbers, are of a small breed, have long erect ears, and most savage tusks; and though the native Highlanders abhor the flesh of this animal, yet they have always abounded in the lower part of the county. The chief manufactures of Caithness are linen yarn and leather. A considerable herring fishery was formerly carried on in the summer months, in which it is calculated that from six to fourteen thousand barrels were annually taken; and it might have become an important branch of industry and commerce, had not the detention of the bounties in 1792 given it a fatal check, and ruined some of the adventurers.

Small veins of iron and lead ores have been discovered in this county, but not in such circumstances as to induce the proprietors to work them. Considerable quantities of white mullidick, and a slender vein of yellow mullidick; also a regular vein of heavy spar, mixed with lead and crystals; three feet in breadth, have been found near Thurso. A copper mine was once begun to be wrought near the old castle of Wick, but was soon afterwards dropped. There are plenty of whinstone, granite, and freestone; likewise limestone and marl. Various attempts have been made for the discovery of coal, but though these have been conducted by persons well skilled in the business, and long persevered in, they have hitherto proved unsuccessful. A mineral, resembling this substance, has indeed been found near the surface, which seems to be an earthy substance, impregnated with volatile inflammable matter. It emits a hot vivid flame when burning, but without much dissolution of parts, or diminution of size, after it becomes extinct.

Among the antiquities of this county are to be found a variety of singular structures, called Piets houses. They are generally of a circular form, rising into the shape of a cone, with its top somewhat blunted, and the walls of the larger kind are nine or ten feet in thickness, and surrounded by a broad deep ditch, and a sort of rampart. These buildings are usually placed on the brinks of precipitous rocks, and in the skirts of sandy bays; and often stretch from one headland to another, evidently so arranged as to communicate with each other. Besides these are John o' Groats' house, whose traditional history is so well known; and the castles of Achaisal, Berrydale, Braal, Dirlet, and Lochmore.

The language spoken by the people of Caithness has always been the same as that of the south of Scotland, except among the hills on the borders of

verns are narrow at the mouth, but in the inside lofty and spacious, and run some hundred yards under ground. The seal hunters enter them in small boats, and lighting torches as soon as they land, with loud shouts alarm the animals, which they kill with clubs as they attempt to pass. This, however, is rather a hazardous employment; for should the wind blow hard from the sea, these adventurers are inevitably lost.
Sutherland, where the Gaelic is used. The names of many of their places are evidently Norwegian, as Ullster, Stempster, Bindster, Scrabster, Bilsber, and several others; the terminating syllable *ster,* signifying in that language an estate.

Caithness sends a member to parliament alternately with the shire of Bute. Its population in 1794 was 24,802; and in 1801, 22,609; of whom 10,183 were males, and 12,426 females. See Pennant's *Tour in Scotland; Beauties of Scotland,* vol. iv. and v.; Sir John Sinclair's *General View of the Agriculture of the Northern Counties and Islands of Scotland.*

**CALABRIA,** a province of Italy, which forms the most southern part of the kingdom of Naples, is bounded on the north by Basilicata, and the gulf of Taranto; by the Ionian sea on the east; and on the south and west by the Mediterranean and the straits of Messina, which separate it from Sicily. This peninsula is divided into Calabria Ultra, and Calabria Citta. The extent of the former is estimated, by Mr. Swinburne, at nearly 1,521,902 English acres, and that of the other at 1,294,370; and their united population at 775,722 inhabitants. This country is rather mountainous, but the valleys with which it is interspersed are rich and fertile, and watered with numerous rivers. No country abounds more in towns and villages, has a greater variety of culture, and is covered with finer forests than Calabria. It has a very picturesque appearance. The form of its mountains differ from those of most other countries. They are seldom of a pointed or conical shape, but almost always round; and though some modern travellers have asserted that they are of volcanic origin, yet no traces of lava are to be found in their neighbourhood. They appear to consist, for the most part, of chalk and argil; and contain pyrites, asbestos, spar, quartz, granite, marble, and different kinds of sand, sometimes mingled without order, and sometimes ranged in regular strata.

Its principal rivers are the Coscile, Crathis, Tronto, Nieto, Tacina, Alili, Abaris, and Angliola. The Coscile is the Sybaris of the ancients, whose waters being strongly impregnated with mephitic gas, were supposed very injurious to cattle, on account of exciting dangerous sneezings and convulsions. The Crathis rises in the mountains south of Cosenza, and passing that city and Bisignano, joins its waters with the Coscile at the site of the ancient town of Sybaris; and falls into the Ionian sea. This river is broad, clear, and rapid, often inundating its banks, and destroying the neighbouring districts; and in 1629, it is said to have suddenly risen 20 palmes. According to Strabo, the waters of the Crathis had the property of tinging of a fair or yellow colour, the hair of all those who bathed in it; and that they were also very efficacious in the cure of several diseases.* The same tradition is preserved, and it may have arisen from the yellow appearance which this river still retains.

The climate of Calabria, which in some places is among the finest in the world, is in several of the most fertile districts very insalubrious, on account of the inundations of the rivers, which being allowed to roll their floods unrestrained over the low and neglected fields, leave, as they shrink back into their channels, black and stinking swamps, which poison with their noxious vapours the whole region around. But by a little industry and management, these bad effects might easily be counteracted, and these rivers, which at present disseminate the seeds of pestilence and disease, might be made to convey freshness and fertility to well tilled thirsty fields.

The soil of Calabria is very unequal, changing from a rich and mellow loam to a cold and wet gravel. Many of the mountains are nothing but bare and barren rocks, while others are covered with majestic oaks, and the sloping side of some of the hills are embellished with fruit trees of every description: such as vines, figs, oranges, lemons, citrons, olives, mulberries, cherries, and almonds. The extensive forest of Sila, celebrated by Virgil in the 12th book of his *Enniid,* v. 715, reaches from above Cosenza to the north of Catanzaro on the gulf of Squillace, and covers a surface of nearly 400 square miles. The ancients, however, comprehended, under the name of Sila, the whole forest extending along the chain of mountains as far as Reggio, which Strabo estimates at about 700 stadia, above a hundred British miles in length. This forest abounds with fir and other resinous trees, which annually afford immense quantities of pitch, rosin, and turpentine. It belongs exclusively to the king; and the inhabitants of the country are prohibited, under the severest penalties, even the confiscation of their property, from cutting down the trees. Above 400 persons are constantly employed in gathering and preparing the resinous substance; and its annual produce is nearly 11,000 *can-\text{\textit{t}}\text{\textit{a}}\text{\textit{res}}* of pitch and rosin. The white pitch is the most valuable, but also the most scarce; seldom exceeding 75 *can-\text{\textit{t}}\text{\textit{a}}\text{\textit{res}},* or 22,688 lb.; while the black pitch affords 10,000 *can-\text{\textit{t}}\text{\textit{a}}\text{\textit{res}},* or 2,777,500 lb. The pitch of Sila is highly extolled by Strabo and Pliny,† as being very rich and resinous, and also, as being of great utility in medicine. It is still very much esteemed, and great quantities of it are annually exported to Sicily, Genoa, and Venice. The lower parts of the mountains abound with the *ornus,* a small leaved flowering manna ash, which grows spontaneously, and without any culture. All the manna belongs to the king, and the gathering of it is entrusted to the feudal lords, who receive for every man employed five *carlini* a day, two of which they keep to themselves. During the manna harvest, which generally lasts four or five weeks, every peasant who is called upon is compelled to abandon his own employment to assist in the work. The manna is extracted by making a horizontal incision in the bark of the tree, about half an inch deep, and inclining a little upwards; a small maple leaf is then fixed into the wound, from which the manna in its liquid state drops into the large leaves of Indian figs, which are placed at the foot of the tree instead of basins. Some kinds of manna, however, ooz out from the bark of the tree without any incision. This is very limpid and transparent, and crystallizes in little balls on the surface. It is preferred to the other kind of manna, but

CALABRIA.

is very scarce, and sells in general very high. The gatherers are allowed to eat as much as they please in the woods, but if the smallest quantity of the juice is found in their houses, they are severely punished, and sometimes even incur the penalty of death. Many of the valleys are covered with the most luxuriant pasture, upon which are fed numerous flocks of sheep, which form the principal wealth of the northern part of the province. Their wool is esteemed equal to that of Spain. It is strong and curled, and is very much employed in the manufactories of Venice. The cultivation of this country, however, is most miserably neglected. Every exertion is paralyzed by the hand of power. The peasant sees no amelioration to his condition from his efforts; and is discouraged from the apprehension, that increasing activity and produce on his part, would only expose him to an additional weight of taxes and oppression. "The husbandry of this province," says Mr Swinburne, "is slovenly, and the skill in gardening very superficial. Both betray a want of emulation and intelligence. Climate and soil do more than half the work, and the hand of dispirited man is sluggishly applied to the task; partial Nature empties the horn of plenty on his head; but, from many fatal causes, her bounty contributes little to his welfare; whilst we see, in more northern and less happy regions, the active enterprising labourer able to extort favours from her, and with the least gaudy of her riches, raise himself to comfort and independence." The Calabrian farmer, instead of mowing and cleaning his ground, thinks he does well if he ceases to plough it for two or three years, and leaves the pasture to make its way through the rank weeds which surround it. In some districts, the common course of husbandry is to take a crop of wheat, and then let the field lie fallow for two years. The mode of letting farms in this country is also a complete obstruction to every kind of improvement. In all the baronial and ecclesiastical estates, a lease of only two years, loaded with many clauses and restrictions, is allowed; and the term is extended by the plebeian landlords to six years. Some of the barons are not content with a short lease and an exorbitant rent; but they encroach upon the commons and cultivated grounds for the sake of extending their chase; and thus the poor peasants have sometimes neither room nor opportunity to raise sufficient food for their support. On the eastern part of the peninsula, however, the state of agriculture is much better, and consequently the ground produces much finer crops. The low lands are extremely rich in herbage, producing spontaneously rich crops of sainfoin; but half of the grass is suffered to rot, in the ground for want of cattle to consume it.

The fertile plains around Reggio appear like one rich and delicious garden, shaded by groves and avenues of poplars and mulberry trees, and divided by hedges of pomegranates, inclosing vineyards and orchards of various kinds of aromatic fruit. All sorts of vegetables abound under their shade, and copious streams distribute life and vigour through these delightful fields. Hemp is the principal production of this district, as being the most lucrative; and the essence of citron, orange, and bergamot, of which not less than 100,000 quarts are annually exported, affords them a considerable article of traffic with the French and Genoese. Great quantities of oranges are also exported from the environs of Rossano, in Calabria Citra, to Taranto and Gallipoli. But the principal article of Calabrian commerce is silk, and it is said that silk worms were first introduced into this country by Roger, king of the two Sicilies; though, according to Procopius, they had been brought into Italy in the time of Justinian. This new branch of industry increased so rapidly; that, in the 16th century, the produce of Calabrian silk exceeded that of all the rest of Italy, and amounted to 300,000 crowns; when a duty of five grana for every pound was imposed upon it by Charles V. in 1542. This imposition was afterwards gradually augmented, till, in the 17th century, it paid 56 grana per pound; which yielded annually to the treasury of Naples nearly 400,000 ducats. The quantity of silk obtained was estimated at three millions of pounds; which, after deducting all expenses, brought into the country three millions of ducats. But this advantage of commerce has of late years very much fallen off; and, indeed, must necessarily decrease, on account of the extortion and vexatious imposition of the government. All the silk pods must be carried to the public cauldrons, where they pay a duty of four carlini a pound for boiling and winding off. Forty-two grana and a half are then exacted for every pound of marketable silk; and one grana a pound for the refuse and unprofitable pods; and, to complete the measure of their hardships, two carlini, or twenty grana, must be annually paid for every mulberry tree which they possess. All the profits are thus eaten up by these odious exactions; and the farmers have been so discouraged, that many hundred of valuable trees have been cut down to save the duty. The peasant can have no interest in the extension or improvement of this manufacture. New improvements only draw upon him new burdens; and, consequently, he looks upon the trade with indifference, and would rather allow it to perish than exert himself for its revival. From such causes the quantity has been reduced to less than one-third of its former product; and it is reckoned, that not above 800,000 pounds of raw silk are now annually exported to Naples from this province. The inferior sort brings 18 carlini per pound, and the best silk 25 carlini; so that the mean price may be estimated at 20 carlini, or two ducats of Naples. The principal manufactories of silk in Calabria are at Monteolone, Reggio, and Catanzaro; that of the latter city is the most important. The other manufactures and exports of Calabria are, silk, woolen and cotton stuffs, iron and earthen ware, hides, honey, and wine. Calabria possesses some very valuable mines of silver, lead, iron, copper, marcasite, vitriol, sulphur, antimony, salt, and coal; none of which are at present wrought, except the iron mine at Stilo, which is worked at 6806 ducats.

The woods of this country are well stocked with game, which are a great annoyance to the farmers, as they are prohibited from killing them,—the barons having the exclusive right of hunting. Among the most delicate of these are dormice, which are smoked out of their nests in hollow trees, and caught with sharp hooks. They are eaten at the tables of
the greatest epicures, and their skin makes very fine leather. Besides sheep, horses, oxen, buffaloes, goats and swine are very abundant in Calabria. The horses are rather small, but handsome, spirited, and patient of fatigue. The breed might be greatly improved; but the prohibition of exportation renders the owners quite indifferent about their perfection. The oxen are white, large, and long horned, except those of the red breed, which have been introduced from Sicily. Buffaloes, goats, sheep, and swine, are in general black.

The inhabitants of this country are a brave and hardy race of men; patient under penury, hardship, and hunger; and possessing symmetry and strength of limb, with an ardent and fiery spirit. His outward appearance—his latticed and miserable garments—he long and black beard—his volubility of gesture—his irascibility—and his violent declamation, point out the Calabrian mountaineer as the unpolished child of nature. He rises against every haughty demand; but if you speak to him with kindness, he will shew himself complaisant, frank, and benevolent. The common upper dress of almost all classes, from the richest citizen to the lowest muleteer, is a short black vest, suspended from the left shoulder, and a bonnet. The women are in general very plain, and are treated little better than slaves. They are seldom allowed to join in any of their festive amusements; but must remain at home, and take care of their household affairs. When a Calabrian returns from his labour with his wife, he stalks proudly before, with his hands empty, while his wife follows behind heavily laden. Notwithstanding this fierce and unbending demeanour, this people possess great goodness of heart, and a considerable share of intelligence. Though they bear with courage the heavy impositions with which they are loaded, yet they often complain of the burden; and submit, not because the sword is suspended over their head, but that they may discover some means of relieving themselves from the yoke.

"The country is filled with scoundrels," said an intelligent Calabria to Mr Bartels, "because government invites them here. The king, they say, is a man of the best heart and the best dispositions, but great care is taken that he shall never know the true situation of his affairs. He is altogether ignorant of the manner in which we are governed, because those who surround him conceal every thing that may be injurious to their own particular interest. This is the reason why we cry out so much against Naples; and this is the reason why we hate every one that belongs to that country. But we love the king as children love their father, because we hear nothing of him but what is good. We regret only that he never comes among us, as we have so great a desire to know him. Immediately after the earthquake in 1783, an agent was sent from Naples to alleviate the burdens of those who had suffered from this dreadful calamity; but what was the result? Government, it is true, remitted to them all imposts for four years; this, however, was but a vain promise, for at the end of two years they were doubled, by imposing new taxes; and under this yoke we groan until this day." Filled with indignation, the Calabrian finished with these words: "Quando è un governo, che si chiama bu- giardone! Our government is beneath all mention!"

This people are very superstitious. They have charms among them, which are fabricated by certain old women on pieces of parchments, which are supposed to render the wearer invulnerable. These are sometimes sold to the braves for eighteen ducats, who now, confident of safety, attack their adversaries without fear. They repose also great confidence in judgments, and expect to see every person that jeers at another's defects afflicted in the same way. All kinds of convulsions are here attributed to the influence of malignant spirits; and nearly 1,500 women, pretending to be possessed with these spirits, go up annually to Lorians, to be cured by looking at a portrait of St Dominic. Every city swarms with monks, to whom are intrusted the education of the youth of the province, and whose whole learning generally consists in reading their breviary, and saying mass. Many of them are scarcely able for so much, particularly those who have been driven, by the oppression of the barons, to assume the religious habit merely to procure a subsistence. Numerous bands of Zingari or gypsies continually infest this country. This strange tribe have no fixed habitation, but wander wherever profit or convenience dictates. They subsist by the sale of little handicrafts of iron, or by the exchange of horses and asses; but chiefly by pilfering and theft. They are a most abandoned, dissolute, and faithless race of vagabonds. They can be bound by no promise or contract, if the least advantage can be gained by the breach of it; and no cheats are more artful or impudent. They have a peculiar language of their own, which, in sound, seems to bear a great affinity to the oriental tongues; and many of their ceremonies and customs resemble those of the heathens. In 1500, they were banished the kingdom as thieves, cheats, and spies. In 1583, the order was repeated; but not being sufficiently enforced, they remain as numerous as ever.

The population of the two Calabrias, besides the Italian inhabitants, consists of several colonies of Albanese, who differ from the original inhabitants of the country, both in religion, language, and in appearance. Large black eyes, a sallow complexion, short curled hair, and strong and muscular limbs, sufficiently distinguish them from the Italian Calabrese. Their language is peculiar to themselves, and its roots are unconnected with all other European tongues. Though it has been known in Europe upwards of 1,000 years, it still remains without an alphabet; and many of its sounds cannot be accurately expressed either by Latin or Greek letters. It abounds, however, with many words borrowed from the old and modern Greek, Latin, Slavonian, Italian, French, German, and, what is very extraordinary, with many English terms employed in their native signification. The men can speak the Calabrese; but the women, who neither buy nor sell, understand no language but their own, which they pronounce with great sweetness of accent. The Albanese are dispersed over the province, occupying whole villages and towns; but many of their settlements are wretchedly poor and much decayed.
Their habitations," says Father Marasotti, "are not regular houses, but merely shepherds' huts, or wooden barracks; and they have commonly deep caverns, where they keep their cattle, hogs, and sheep. They are chiefly employed in agriculture, and carry their corn, cheese, and cattle, to the neighbouring towns and villages.

This people were first introduced into Italy about the middle of the 15th century. After the death of Scanderbeg, prince of Epirus, or Albania, the only support of the Christians against the growing power of the Ottomans in Europe, the Albanians abandoned themselves to despair. Unable to withstand the forces of Mahomet I., over whom they had obtained so many glorious victories before they were deprived of their leader, and seeing themselves exposed to the fury of the Turks, they resolved to leave their country, and seek an asylum in the kingdom of Naples. The miseries to which they were reduced before they adopted this resolution, are most accurately described by Pope Paul II., in his letter to Philip Duke of Burgundy. "Albanians partim casi gladio sunt, partim in miserariam servitum abducti, oppida que ante pro nobs Turcorum substinentur impetus, in ditionem eorum venerunt. Vicina partes, quae Adriaticum mare attingunt, propinquus motu exterrire, tremunt. Ubique pavor, ubique lacrimas et captivantes ante oculos sunt. Audire miserum est, quanta omnium rerum sit conturbatio. Lacrymabile, inspicere fugientium, ad Italos portus appellee, familias quoque gentes pulsas sedibus suis passim sedere per littora, manusque in celum tendentes lamentationibus suscuncta implere." Ferdinand I. king of Naples, being touched with their misfortunes, invited them to settle in his dominions; and, being grateful for the assistance which he had formerly received from their Prince Scanderbeg, who had established him upon the throne, not only assigned them lands, but granted them exemption from taxes, with many other privileges. They fixed their habitations chiefly in Calabria, as being under the protection of the Prince of Bisignano, who had married an Albanese princess, and whose numbers continued to increase, by the addition of new colonies, until the reign of Charles V. This prince, to whom they had delivered up the city of Corona in 1592, liberally rewarded its inhabitants who had settled in the province of Calabria, with lands, and an exemption from all imposts, both ordinary and extraordinary, for their fidelity and devotion. Bred to arms, and inured to hardships, the Albanese formed some of the finest troops in the armies of Naples; and, as long as a sound policy directed the affairs of the government, they enjoyed every protection, and were exempted from every impost. But under the viceroys of Spain they were neglected and oppressed. The lands which they possessed were impoverished and exhausted, and could scarcely yield them a scanty subsistence; and the taxes with which they were now loaded reduced them to the lowest state of abjection and misery. A duty of twelve carlini a year was imposed upon every house,—a measure the most partial and unjust, as the poorest Albanese, who had scarcely wherewith to satisfy the cravings of nature, was equally burdened with the richest citizen of the kingdom. From this impost, however, the ancient inhabitants of Corona were exempted; but other circumstances, such as the despotism of the barons, and the persecutions of the Romish clergy, contributed to confound them in the same abject condition. As members of the Greek church, they observed the Greek ritual, and had priests of their own; but a want of colleges, and other seminaries of education for 230 years, had plunged them into such a state of ignorance and barbarism, that there could scarcely be found a priest among them that knew Greek enough to perform divine service in that language. In this state they would have remained, had it not been for the exertions of M. Rodota, librarian of the Vatican, who being also of the Greek persuasion, prevailed upon Clement XII. to found a college at St Benedetto Uliano, for the education of such young Albanese as wished to dedicate themselves to the service of the church. This establishment was endowed by Charles III. with the wealth of the royal abbey of St Benedetto Uliano, which was also declared to be exempted from every duty whatever. Rodota himself was consecrated archbishop in partibus, and acted as president of the college, but in his episcopal powers was subordinate to the Latin prelate of Bisignano, without whose licence he could not confer orders upon his students. Rodota, however, lived too short a time for the good of his settlement. Abuses soon crept in, and its funds have been egregiously mismanaged. Little benefit, indeed, has been derived from it, since his death, until the year 1792, when Don Francesco Bugliari, a man distinguished by his talents and his integrity, was called to the head of the seminary. He sought Ferdinand IV. to augment the revenues of the college, and to remove it from St Benedetto Uliano, where the climate was very unhealthy. It was consequently transferred to the convent of St Adrian, and its revenue considerably increased. From that time it has been distinguished in the literary republic by the ability and learning of its professors, and the good conduct of its students. But its prosperity was of short duration. In 1799 it was pillaged by a band of Calabrian banditti; and it was scarcely restored to its former splendour by the exertions of M. Bugliari, than it was again sacked and plundered in 1806. This second disaster overpowered Bishop Bugliari with grief; and "be chose rather," says M. Masci, an Italian writer, "to die by the murderous hands of assassins, than to fly and abandon the place of his most tender regard. His death is felt by every heart. This is the best eulogium that can be paid to his virtues." He is succeeded by M. D. Domenico Belluscio; and the greatest advantages are expected to accrue to Calabria and the hitherto neglected Albanese. The Greek rite is now chiefly confined to the district of Consenza; the other Albanese who are scattered over the rest of the country, having been either persuaded or compelled to conform to the Roman liturgy and discipline. The Albanese are now a quiet, industrious race. Among them the priesthood is the highest nobility; and, as the clergy are not bound by any vow of celibacy, like their neighbours of the Re-
This province has in all ages been desolated by earthquakes. It was almost utterly destroyed by these awful visitations in 1638, and in 1639; and in 1783, the whole of Calabria Ultra, from Cape Spartivento to Amantea, above the gulf of St Eufemia, was so completely convulsed, that not one stone was left upon another south of the narrow isthmus of Squillace. The earthquake of 1638 is feelingly described by Kircher, who was an eye witness, in the preface to his Mundi Subterraneus; and a particular account of the last most disastrous and calamitous catastrophe, is given by Sir William Hamilton, who was then English minister at the court of Naples, in a letter which is inserted in the "Philosophical Transactions" for 1783. The most violent shocks happened on the 5th and 7th of February, and the 28th of March; and it is worthy of observation, that the first week of February had been formerly twice fatal to this country, and the 27th of March was thrice marked with a similar calamity previous to 1783; and, upon comparing the dates of the great earthquakes that have afflicted Calabria since the eleventh century, Mr Swinburne found that seven of them happened in the four first months of the year, one in August, and four in November and December. The miseries to which the Calabrians were reduced upon this unfortunate occasion, cannot be conceived except by those who have witnessed the ruin and desolation which these terrible ministers of destruction have scattered over a populous and fertile country. Above 30,000 inhabitants miserably perished, being either buried in the waves, destroyed by the falling of their houses, or swallowed up by the opening of the earth. The rest, deprived of the necessities of life, and without habitats, during an inclement season; their fortunes ruined; their friends and families destroyed; and famine, disease, and pain, their only expectation; their condition called for the most speedy and humane assistance. Their Sicilian majesties were wanting neither in exertions nor liberality on this occasion; and to their honour let it be recorded, that all that could be done by a benevolent sovereign, actuated by a true paternal affection for his subjects, was done for the relief and accommodation of the distressed Calabrians. Vessels loaded with every thing necessary were immediately dispatched; and the king ordered an officer to take all the money which the royal treasury could supply or borrow; and even, if required, his own plate, and the very furniture of his palace. All ranks were interested in the miserable fate of this province; and we are informed that the officers and porters belonging to the custom-house of Naples, who were employed in loading the vessels, universally refused to accept of pay for their labour. "Stupendous alterations," says Mr Swinburne, "were occasioned in the face of the country; rivers choked up by the falling in of the hills, were converted into lakes, which, if not speedily drained by some future con- vulsion, or opened by human labour, will fill the air with pestilential vapours, and destroy the remnants of population. Whole acres of ground, with houses and trees upon them, were broke off from the plains, and washed many furlongs down the deep hollows, which the course of the rivers had worn; there, to the astonishment and terror of beholders, they found a new foundation to fix upon, either in an upright or an inclining position. In short, every species of phenomenon incident to these destructive commotions of the earth, was to be seen in its utmost extent and variety in this ruined country." See Swinburne's Travels in the two Sicilies; Bartels Voyage dans la Calabre, &c.; Maraffotti Croniche ed anichita di Calabria; Phil. Trans. vol. lxxxvi. p. 367; and Annales des Voyages, vol. i. and iii. (p)

CALADIUM, a genus of plants of the class Monocculia, and order Polyandria. See Botany, p. 323.

CALAIS, a sea-port town of France, and the chief place of a district in the department of the Pas de Calais, is situated in marshy ground, which, by means of sluices, may be overflowed at pleasure. It is nearly surrounded by a moat and a wall, which is used as a public promenade. Calais is defended by a citadel on the north-west side, near the sea, and nearly as large as the town. Fort Nieul, which is an oblong square, and was built in 1680, is supported by piles, and is connected with the citadel by a mole. The town has the form of a parallelogram, with the long side towards the sea. The streets are strait, well paved, and tolerably clean, and the houses are well built. The principal public buildings are the arsenal, built by Cardinal Richelieu, several churches and monasteries, a tolerably good theatre, and the hotel at the Lion D'Argent, which resembles a small town in the middle of Calais. The harbour of Calais is formed by a small rivulet; but is now in a great measure obstructed with sand. It commences at the gate of the town, where a large solid quay terminates in two long wooden piers, which stretch into the sea. It is dry at ebb tide, and with a common flow has three fathoms at high water. Nearly opposite to the head of the west pier, there is a bank on which are two fathoms; but between the pier head and the bank is a channel, which has three fathoms at half flood. At spring tides, it is high water at 11 h. 30 min., and the flood sets in N. E. by E. Proposals have repeatedly been made to improve and deepen the harbour of Calais; but there have never been listened to, though the expense would not exceed 1,500,000 livres. At the beginning of the eighteenth century, this harbour admitted frigates of 40 guns. Vessels of 300 and 400 tons entered it at high water, and vessels of 200 and 300 tons at all times; and if they were properly deepened, it would still afford the same accommodation. The shore towards Dunkirk...
CALAMINES. See PHILIPPINE ISLANDS.

CALAMO, CALMING, or CALIMENA, the Claros and Calydna of the ancients, is an island of the Archipelago, not far from Mitylene, and about five or six leagues in circumference. "There are on this island," says Sonnini, "some very lofty mountains, a population far from numerous, and the remains of an ancient town on the west coast; on the other side, a village, which also bears the name of Calamo, built on the summit of a mountain; and near to it, a tolerably good harbour, formed by a bight or small gulf, before which lies an islet, that shelters it from the winds and sea: but this harbour is little frequented; the main land, which is in the vicinity, and the larger islands, which are within reach, present harbours still better, and at the same time more calculated for the supply of provisions to navigators, and for the speculations of tenders. Calamo is, in fact, a poor island, which cannot provide for the subsistence of its inhabitants, almost all occupied in procuring foreign resources by a carrying trade. Their mountains, indeed, contain minerals; but this circumstance, which, under another government than that of the Turks, would constitute the wealth of a country, would under them become a source of oppression and ruin." Sonnini’s Travels in Greece and Turkey, chap. xiii. p. 160, 161. (a)

CALAMUS, a genus of plants of the class Hexandria, and order Monogynia. See Botany, p. 191.

CALAMY, EDMUND, an eminent non-conformist divine, was born in the year 1671. He was son of Mr. Edmund Calamy, minister of Moreton, in Essex, and grandson of Mr. Edmund Calamy, minister of St. Mary Aldermanbury. The father’s life was distinguished by nothing more remarkable than his suffering, like many others, by the infamous act of uniformity. But the grandfather had a character which raised him above most of his contemporaries, and rendered him worthy of some notice. After going through a course of liberal education, he entered the church, and continued a conformist, though not a very strict one, till the imposition of Bishop Wren’s articles, and the reading of the book of sports, wounded his conscience, and obliged him to withdraw his attachment. He was one of the authors of the famous book against Episcopacy, known by the name of Suetonius, he was nominated by the House of Lords, in 1641, as one of the sub-committee for religion; he acted a conspicuous part in the Assembly of Divines; his influence in the city of London, on account of his ministerial talents, was greater almost than that of any other man: he strenuously and boldly opposed the regicides of Charles I., and was active in promoting the restoration of the second Charles, who rewarded him, by first offering him a bishopric, of which he could not conscientiously accept, and then subjecting him to all the rigours that were inflicted by the act of uniformity. He is said to have died of a broken heart, occasioned by his seeing London in ashes, after the great fire in 1666.

The subject of the present article, who, in many points, resembled his grandfather, received his early education chiefly from Mr. Samuel Cradock, who kept a private academy at Wickhambrook, in Suffolk, and under whose able tuition he remained for a considerable number of years. In that and the other schools which he previously attended, he not only studied with so much diligence and success, as to secure the high approbation of his masters, but also displayed such amiable dispositions, as to lay a foundation for lasting friendship, with men whose friendship was equally useful and honourable to him in future life. Among these may be mentioned, Mr. Dawes, Mr. Hugh Boulter, and Mr. Timothy Godwin, who were afterwards archbishops respectively of York, Armagh, and Cashel, and whose esteem for Mr. Calamy was neither destroyed by the contrariety of their religious opinions, nor diminished by the difference of their ecclesiastical rank.

At the age of seventeen he went to the university of Utrecht, where he engaged in study with redoubled ardour, and made distinguished proficiency in the several branches of learning to which he applied himself. He was much noticed by the professors. He acquired an intimacy, which was never broken off, with Lord Spencer, afterwards Earl of Sunderland, and secretary of state to Queen Anne; and with Mr. Charles Trimnell, who rose successively to the bishoprics of Norwich and Winchester. And so great was his reputation, that he had an offer of a professor’s chair in the college of Edinburgh from Principal Carse, who had been sent over to Holland to procure a person properly qualified for such a place. This offer he declined, and soon after he returned to England. He went first to Oxford, where he laboured to improve himself, by researches in the Bodleian library, conversation with literary men, and other means and opportunities of making intellectual attainments, which were to be found in that seat of learning. Having determined to betake himself to divinity, he directed his attention closely and steadily to the various subjects comprehended under that science. He carefully searched the Scriptures; he perused the writings of the primitive fa-
CALAMY.

Calamy. — He made himself well acquainted with ecclesiastical history; and then, entering on the later controversies, considered with particular care and interest the one which subsisted between the Church of England and the nonconformists. His examination of its merits was long, minute, and temperate; and it terminated in a decided attachment to that party, which, the claims of both being supposed equal, a worldly mind would certainly not have preferred. United with the dissenters from convictions of right and duty, he soon employed his talents as a preacher of the gospel in that communion; and, after labouring for some years in this subordinate character, he received Presbyterian ordination in 1694. This ordination was the first public transaction of that nature which had taken place since the passing of the act of uniformity. It was usual, on former occasions, to have no person present except the ordainer and the ordained; but Mr Calamy was resolved to have as great a degree of publicity as possible connected with his admission into the Christian ministry. And, after encountering some difficulties from the timidity of his brethren, he succeeded in procuring the ordination of other six at the same time. The whole service, which was conducted with requisite solemnity, as well as unprecedented openness, lasted from ten in the morning till past six in the evening. Mr Calamy, after holding some inferior situations, was, in 1703, chosen pastor of a large congregation in Westminster, London. Previous to this appointment, he had made himself useful to the dissenting cause, and acceptable to all its supporters, by publishing an Abridgment of Mr Baxter's History of his Life and Times; to which he added, an account of other ejected ministers,—an apology for themselves and their adherents,—and a continuation of their history to the year 1691. Of this work he published, in 1713, a second edition, with considerable improvements, in 2 vols. 8vo, and dedicated it to the Duke of Devonshire. It, of course, gave great offence to churchmen, and high satisfaction to dissenters, when it first appeared; and to this day is regarded with similar emotions by their respective descendants. Bishop Burnet thanked him for it, declaring, that he had read it with much pleasure. Some attacks were made upon it; in repelling which, Mr Calamy evinced both strength of argument and moderation of temper. His conduct to Mr Hoadley, the celebrated bishop of Bangor, was particularly candid and enlightened, and deserves to be recorded as a singular fact in the history of religious controversy. Mr Hoadley had written an answer to the tenth chapter of Mr Calamy's Abridgment, respecting the reasonableness of conformity to the church of England. This gave rise to various pamphlets, in which these champions contended against each other with great talent and great perseverance. At length Mr Hoadley published a defence of Episcopal ordination. To this Mr Calamy composed an argumentative and historical reply; but, with a forbearance and a generosity which do his memory the highest honour, he did not print it, because it would have diverted his antagonist from that struggle in behalf of political and religious freedom, which he so ably maintained against the abettors of the corporation and test acts. Such an exhibition of liberal principle, is of itself sufficient to make the name of Calamy dear to every friend of liberty, and every admirer of moral greatness.

One of the pamphlets which he produced in the course of this dispute is worthy of being particularly noticed, on account of the unqualified praise bestowed upon it by Mr Locke. It is his Defence of Moderate Nonconformity, the introduction to which that eminent philosopher affirmed, in a message to the author, to be invulnerable both in its principles and its reasonings. In 1709, Mr Calamy went into Scotland. He there met with the kindest reception, and most respectful treatment. The universities of Edinburgh, Glasgow, and Aberdeen, conferred on him the degree of doctor in divinity. Every attention was paid to him by the professors and literati of the places which he visited; and his impressions of the Scotch nation were, upon the whole, highly favourable and pleasing. It was about this time that the French prophets made so much noise in England. The principles and conduct of these suspicious enthusiasts were thought deserving of the interference of government, and the attorney general was ordered to prosecute their ring-leaders. Before, however, any decisive measures were adopted, Lord Godolphin and Mr Harley consulted Dr Calamy, who, from his knowledge of their pretensions and character, and his general sagacity in such matters, was well qualified to give a sound advice. He advised government to abstain from giving any disturbance to the self-created prophets. His counsel was prudently adopted; and the consequence was, that the fanatics, who had excited so much unnecessary alarm, soon dwindled away into insignificance and contempt. Dr Calamy assisted in the extinction of this miserable sect also, by writing a Cædics against the New Prophets, for which he received the thanks of Queen Anne, who considered it as a public service.

In the years 1718, &c. there were keen disputes among the dissenters respecting subscription to the first article of the church of England, which relates to the doctrine of the Trinity. He attended one of their private meetings; but distinctly foreseeing the quarrel which ensued, and afraid of the evil consequences to which it might lead, he attended no more; and neither openly joined with the one party nor with the other, when they even came to a division on the subject of discussion. He was not indifferent, however, to the doctrine of the Trinity, which he defended in fifteen sermons preached at the Merchants Lecture in Salters' Hall. These sermons he published in 1722; and for this volume, the author not only received the thanks of several dignitaries of the established church, but was also honoured with gracious acknowledgments, and a gratuity of fifty pounds, from the king himself. In 1727, he finished his great work, entitled, A Continuation of the Account of the Ministers, &c. ejected after the Restoration. This book is well known to those who are conversant in the history of that period. It reflects the highest credit on the industry and impartiality of the author, though it has not been so fortunate as to escape the censures of high-church writers; and is most deservedly popular, both as a collection of
biographical sketches, and as a repository of interesting
and important facts. Dr Calamy, with a high
reputation for learning, judgment, candour, benevo-
lence, and piety, died (1732) in the sixtieth year of
his age, having been twice married, and leaving be-
hind him several children. See Mayo's Funeral Ser-
mon on Edmund Calamy, D.D.; Calamy's A
bridgment of the Life of Baxter; and Biographia
Britannica. (x)

CALANCHOE. See VEREA, BOTANY INDEX.

CALATAGIRONE, the name of a city in Sic-
ily, situated in the Val di Noto, on the top of a
high insalubrious hill, and surrounded with groves of
cypress. The road up the hill, which is well paved,
is so extremely steep, that it can scarcely be ascended
by any other animal but a mule or an ass. This city
is considered as very ancient by the natives, who sup-
pose it to have been the island Gela or Gelone of the
ancients. Ancient coins are still found here, and
De Non is of opinion, that it must have been the
Hylaeran of antiquity. The inhabitants of Ca-
latagirone are reckoned the most polite people in the
island. Many of them live in an elegant manner, but
the greater proportion are employed in agriculture;
in the manufacture of potters ware. The town
was fortified by the Saracens, from whom it was tak-
en by the Genoese. The corporation is one of the
richest in Sicily, from the estates with which the
bravery of the inhabitants was rewarded by Earl Ro-
iv.; and De Non's Travels in Africa, p. 292. (x)

CALBARY, CALBARI, or CALABAR, is a dis-
trict lying on the west coast of Africa, between the
Rio Real, and the river Forcades. The river Calbary,
which waters the district, and from which it takes its
name, though large, is very shallow, and is only navi-
gable by small vessels. The principal place of the
country, which is likewise called Calbary, is situated on
the north bank of the western arm of the river, and is
the place with which the Dutch had formerly estab-
lished a very considerable trade, which is now trans-
ferred to Bani. The other towns are Wyndorp, or
Tokhe, situated near the coast, on the west bank of
the river; Bells, situated about twelve leagues west of
the town of Calbary; and Culeba, the capital of the
province of Bani.

The face of the country is almost entirely covered
with thick woods, and is inhabited; more by wild
beasts than by the human species. Though the
rains are very frequent, yet the earth is so sandy, that
no mark of humidity remains after the rain has ceased.
According to Gazzelli, who wrote in 1699; about
30 or 40 tons of ivory were annually exported by
the Dutch, who also carried on a very extensive traf-
fi in slaves, which they received in exchange prin-
cipally for bars of iron, copper, and brass.

The cannibal Negroes, who inhabit the eastern
banks of the Calbary, circumcise all the marriageable
women; they sell their captives, and eat only those
who are slain. The canoes which they use are sixty
feet long and six broad. The rowers are seated on
cross benches; and near each of them hangs a
quiver of arrows. Reed mats spread upon poles,
and fixed like tents, protect the masters during
the night, while the slaves are exposed to all the ri-
gours of the weather. A full account of the trade
in slaves which was formerly carried on in Calbary,
will be found in Peuchen's Dictionnaire de la Geogr.
Commercante, vol. iii. p. 250. (m)

CALBONGOS, or CALBORGAS, the inhabitants
of a country on the coast of Guinea, in Africa, lying
between the river Rio del Rey and the river Gabon,
but principally upon the banks of the former. The
country is low and marshy, and the village where the
commerce is carried on is situated on the east point
of the embouchure of a small river, which discharges
itself into the Rio del Rey, and which is navigable
for chaloupes. The trade was altogether in the
hands of the Dutch, who exported annually from the
country about 400 or 500 slaves, and from 1000 to
1200 tons of ivory, which they received in exchange
for bars of iron, necklaces, bracelets, &c. As the
Calbongos are little known, it is customary to stop at
the Prince's Island and the island of St Thomas
to take Portuguese guides. The greatest incommo-
venience in the country of the Calbongos is that there
is no fresh water but what is collected on the tops
of the houses during wet weather, and the air is con-
stantly loaded with fogs.

A people called the Ambozes belong to the coun-
try of the Calbongos. They have several villages to
the east of Cape Camarones, which Barbot calls Ser-
ges, Bodia, and Bodiva. The land produces all kinds
of plants and fruits known in Guinea, except palm
trees. In this place vessels may be furnished with
cattle, poultry, fruit, and other refreshments.
No palm wine is to be obtained; but in place of this the
inhabitants use a very agreeable beverage, which is
made of roots called Guinandas, boiled in water.

Upon the coast there are three islands called the
Ambozes Isles, about seven leagues from the river
Camarones, and six leagues from Cape Ambosine,
towards the south east. The most eastern of these
is the greatest and the most populous. Vessels
may pass between the three islands, and sometimes
anchor at their entrance, where they may be seen
from the town of Bani. The trees of the
island are of different sorts, and the sea produc-
oses much fish. The inhabitants understand the Por-
tuguese language, and are reckoned the most dan-
gerous negroes in Guinea.

The Calbongos are represented as filthy, wicked, and
deceitful. They are insincere in their dealings,
and desist from natural affection. Parents will sell
their children, husbands their wives, and brothers
and sisters. They go almost naked, and bedaub their
bodies with various colours. All criminals are said
to be declared innocent, who make an incision in their
arms and suck out the blood. (w)

CALCCEOLARIA, a genus of plants of the class
Diandria, and order Monogyria. See BOTANY, p. 88.
CALCUTTA, the capital of Bengal, and of all
the British possessions in India, is situated on the
eastern bank of the Hoogly, which is navigable up
to the city for the largest indiamen. It extends ful-
Between Fort William and the city is a level plain called the esplanade, where the inhabitants of all ranks and descriptions daily resort for air and exercise. From day-break, until the sun has got to some height above the horizon, it is crowded with Europeans and natives, who come to enjoy the cool air of the morning; and, in the evenings, it presents a grand display of equipage and beauty, with every variety of vehicle and complexion; from the coach and four to the one horse chaise, with the palankeens and hackeries of the natives; and the dark Hindoo and tawny Moor contrasting with the fair and florid countenances of the English. On the west side of the esplanade stands the new government house, erected by the Marquis of Wellesley. It is a noble and beautiful structure, worthy to be the residence of the head of a great empire. Over the four colossal arches or gates that lead to it, are placed sphinxes, with various figures and emblems; and over the eastern and western gates are emblazoned the king's and company's arms. "With respect to the interior of the building," says a modern author, "any adequate idea of it cannot be conveyed by words: the eye, not the ear, must be the medium of communication. The marble hall, in particular, brought to my mind many of the glowing descriptions in the Arabian Tales, of enchanted castles, &c. and indeed I could scarcely persuade myself, that I was not treading on magic ground, all the time I was wandering through it." The old fort, which is situated near the centre of the town, has been converted into a custom-house; and the "black hole" is now part of a go-down, or warehouse. In front of the gate, is a handsome stone obelisk about 50 feet high, which was erected by Mr Holwell to the memory of his fellow prisoners, with whose names it is inscribed. It records also the infamy of those, who, by removing their ships from the vicinity of the fort, left so many brave men at the mercy of a tyrant. The other public buildings of Calcutta are the court-house, over which are two handsome assembly rooms; the Armenian church; and one English church! In the middle of the city is a large reservoir, or tank, dug by order of government, in order to supply the inhabitants with water during the dry season, as the water of the Hooghly is then rendered brackish by the influx of the tide. It covers upwards of 25 acres of ground; and the number of springs which it contains preserves the water always sweet and fresh, and nearly at the same level. A rail is placed round it; and though no person is allowed to wash in it, yet all are at liberty to take as much water as they please.

Calcutta is the residence of the governor-general of India, and the seat of the supreme court of judicature, which consists of four judges, who dispense justice according to the laws of England. The jurisdiction of this court embraces all the company's territories in this part of India, and also extends to every case, civil or criminal, that may occur upon the sea between the Coromandel and Malacca coasts. It does not, however, reach to the higher stations; but in these the European settlers have come under an engagement to be amenable to its authority. The upright proceedings and the decorum with which the business of the court is conducted, have gained
it the confidence of the inhabitants; and though many of the company's servants, whose avarice or dissipation have led them to injustice, bear it a secret and rooted dislike, it has contributed greatly to the comfort and protection of the natives, and has in a manner raised them to an equality with Europeans. That discretionary power, which the English formerly claimed over the Hindoos, and which, they contended, was absolutely necessary, in order to maintain subordination and obedience, is now completely abrogated. The Hindoo can appear in court without any fear of insult or violence, and rigidly demand the payment of his wages or accounts. If the debtor is unable to comply with his just demand, he feels gratified rather than hurt, that he can command the personal liberty of an European. The plea of colour, of country, or of religion, can avail nothing in the eyes of an upright judge; impartial justice is administered equally to all. Petty delinquencies are tried by a superintendent of police, and several inferior justices of the peace, who are Europeans; and the peace of the city is maintained by a few companies of sepoys, who regularly patrol the streets.

Calcutta is the emporium of Bengal, and the channel through which the riches of the inland provinces pass to Europe. Ships belonging to every nation are seen in its harbour, and every mercantile speculation is carried on here with a zeal and activity equal to that of any other city in the world. Its foreign trade extends to every port of any note in Asia and Europe; and the annual dealings of some houses has been estimated at two crores of rupees, about L.2,400,000 sterling. Its commerce in sugar, opium, silks, muslins, &c. is very considerable. Vast quantities of salt are exported to Assam, for which it receives gold, silver, ivory, musk, and a particular species of silky cotton. Cowry shells, which are used in the country as a small coin, are brought from the Maldives in exchange for rice; and fine muslins and calicos form a principal article of exportation to Europe. The advantageous traffic, however, which formerly subsisted between this port, and Pegu, Siam, and the Malay islands, and which consisted in the exchange of silver bullion, gold dust, and precious stones, for raw and wrought silks, coarse cotton cloths, opium, and saltpetre, is now very considerably diminished, and, according to Mr Forster, unless some favourable change is speedily effected, bears the appearance of a total failure. "The extent of the private trade of Calcutta," says Dr Tennant, "cannot be estimated justly, either from the numbers or the burden of the ships belonging to that port. Till lately, there were only 60 that properly belonged to the British merchants here, and their burden was about 27,000 tons. But it is well known, that their concern in foreign ships is very considerable." For a full account of the trade of Calcutta, we must refer our readers to the article INDIA.

Great difficulty and expence was formerly experienced at this port, in unshipping merchandise, from the want of a proper landing place. This of late has, in some degree, been obviated by the erection of a quay in front of the custom-house; and it has been proposed to carry the embankment the whole length of the town, which will undoubtedly be a great improvement. The dangerous navigation of the Hoogly, however, is still a considerable drawback to the trade of Calcutta. The banks which infest the mouth of the river, and are formed by the sand and mud washed down during the rains, are continually changing their situation and dimensions; and it requires great attention, and almost constant sounding, to place the buoys in proper positions, so that vessels may not be misled when entering the river. This duty belongs to the pilot service, which is under the direction of the marine board, and is, in general, performed with great care. At the confluence of the Hoogly and Old Ganges, there is a very dangerous shoal called the James and Mary, on which vessels are frequently lost, particularly in light winds, when the stream is running strong on the flood into the latter river. Ships, when attempting to turn into the Hoogly in such circumstances, are often carried upon the shoal, when they are upset in an instant, and are rolled over and over in a most frightful manner.

The British merchants, who are not in the service of the company, constitute a numerous and respectable class of the community; and though many of those who belong to the civil and military departments of the government affect a superiority over them, which they are entitled to, neither by their talents, opulence, nor character. Several of these merchants have acquired large fortunes, and display an elegance and splendour in their mode of living, to which few of that order in society ever aspire. Among the foreign merchants, the Armenians approach nearest to the English in number and respectability, and also in their fondness for show and elegance. They are a peaceable and inoffensive people, regular and diligent in business, and much attached to the British government. Many of them are possessed of large capitals, and carry on an extensive trade to China, and to the ports towards the west as far as the Persian Gulf. The Mogula, however, are the most wealthy; and from the exorbitant rate of interest at which they let out their money, some of them draw an annual revenue amounting to three times more than is yielded by any capital in Britain. But however rich, the Hindoos still retain their narrow ideas, and parsimonious habits. Their houses and shops are mean and disagreeable; and the only scenes when they launch out into any extraordinary expense are at marriages, and religious festivals. At these ceremonies the company, composed of all ranks and denominations, assemble under a large canopy illuminated with splendid lustres. Otto, rose-water, and other perfumes, are scattered with great profusion, and the sweetmeats are served in vessels of gold. These, with the monotonous draws of singing girls, and sometimes a pantomimical performance, constitute the whole entertainment.

The retail trade of Calcutta is chiefly in the hands of the Banians, Sarkars, and Writers, who go about hawking their commodities, and searching after cheap purchases; and such is their eagerness for money, that every species of low cunning and deceit is employed to over-reach the purchaser. So far, however, is imposition in this way considered as any discredit among their countrymen, that those who are noted for it, obtain the appellation of yukea adhyar,
men of strong parts. Yet these people often sell their goods at a lower rate than they can be purchased from Europeans. This they are easily enabled to do, as their wares are generally bought at sales, where they are often procured, on very moderate terms; and also from the low rents of their shops, which being situated in the common bazaars, must be infinitely cheaper than the splendid apartments of the British merchants. Indeed, the charges of rents, clerks, freight, insurance, with the innumerable items of go-down, deeply affect the profits arising from mercantile concerns in this city. Not many years ago, a house barely sufficient to accommodate a genteel family, could not be procured under six or eight hundred pounds a year. This, together with the wages of a numerous train of servants, which the superstition of the natives, by deterring them from performing service beyond one specific kind of work, has rendered absolutely necessary, greatly swells the annual expenditure of a family. The exorbitant rents, however, have of late been reduced, in some measure, by the speculation of house-building, which has been carried to an immense extent; but this reduction can never be very great, for, considering the rate of interest in this country, a considerable annual income is lost in the capital sunk in building.

But notwithstanding the heavy expenses to which the British merchants and other inhabitants of this city are exposed, their acts of munificence and charity to indigent persons equal, if not surpass, those of any other body of men whatever. Numerous useful and benevolent institutions have also been established, and are supported entirely by their liberality. Among these are, an hospital for the reception of such natives as, from accident or disease, may stand in need of medical aid; two schools for the relief of the orphans both of the privates and officers in the military service of the Company, at which, from six to seven hundred children are educated and maintained; a free school, which educates 400 children, besides others of inferior note.

The college of Fort William, which was established by the Marquis Wellesley, has been partly abolished by the court of directors. This seminary was intended by its noble founder, not merely for the education of the junior servants of the company, but also to watch over their conduct, and to preserve them from the many dangers and temptations to which young men are exposed on their arrival in India. What is retained, regards chiefly their instruction in the native languages. It assumes no control over their actions or their expenditure. In these respects they are left entire at their own disposal; and we need not wonder, from their little experience in life, the scenes of extravagance and dissipation in which they are led to mingle, and the facility of receiving money in this country, many are involved, at an early period, in difficulties and embarrassments from which some of them, by many succeeding years of economy, are scarcely able to extricate themselves. Were it indeed possible, by such an institution as was at first proposed, to preserve these young men from the contamination of bad example, and from those vices and follies in which, at such an age, they are too apt to indulge, we must regret that the directors, should have been prevented, either from a principle of economy or of jealousy, (with which they have been charged,) from carrying the original plan into full execution. ‘Had Lord Wellesley’s plan of a college,’ says Lord Valentia, ‘been acceded to, this desirable end would have been attained; and the young men, subject to the restrictions and discipline of such an institution, would no longer have met with those facilities in raising money, with which their present situation so often presents them. They must, in consequence, have been obliged to confine their expenditure to the liberal allowance of the East India company, till called to the higher appointments, when, unincumbered in their affairs, and uncorrupted in their minds, they might rapidly and honestly have acquired, at an early period of their lives, that opulence, which would ensure them influence and comfort in their native country.’ But Dr-Tennant seems to hold very different opinions from those of his lordship respecting the utility of this college. When speaking of it in his Indian Recreations, he says, ‘As it is for business and not education that these gentlemen are sent to India, it is difficult to foresee any benefit that will ever result from this measure. Instruction in the native dialects is, in general, all that is necessary to qualify them for the exercise of their duty, and this they have hitherto received from Moonshees, at the spare hours that are not employed in their different vocations. The practice of their professional duty of itself, greatly assisted them in acquiring the language of the natives; while it prevented the loss of several years, and a great expense, which is incurred at this dissolute seminary.’ The directors, however, seem to have been convinced of the expediency of some other establishment, at which their junior servants might be qualified for their particular appointments; and consequently a college has been lately established at Hertford in England, upon a plan somewhat similar to that of the original institution. But however well qualified the young men may be in respect to education, and a knowledge of their profession, when they leave England, they are still liable, upon their arrival in India, to be infected with the vices and extravagance of a dissolute capital. The most effectual remedy, we presume, for the evil complained of, would be, an immediate appointment to some situation; instead of allowing them to linger in Calcutta, without employment and without a guide, exposed to the contamination of profligacy and folly.

The Asiatic society, which was instituted by Sir W. Jones, in 1784, for the purpose of enquiring into the history, antiquties, arts, sciences, and literature of Asia, offers to rival the Academy of Inscriptions at Paris, and its researches contain much valuable and useful information upon subjects with which Europeans were formerly very little acquainted.

Situated in the midst of a flat and marshy country, and exposed to the tropical heats, Calcutta can never enjoy a salubrious atmosphere. At its first establishment as an European colony, the climate was almost equally destructive with that of Batavia; and though now greatly ameliorated, by clearing away part of the trees and jungle in the vicinity, by draining some of the most offensive marshes, and by filling up many of the tanks in the streets, it still proves a severe trial.
CALCUTTA.

...to European constitutions. Many fell a sacrifice to its first attacks, and more receive the seeds of a slow but certain destruction. "A sallow and livid complexion," says Dr Tennant, "is so universal, that when you behold a face of the roscate hue, you can pronounce that its owner is newly arrived, nearly with as much certainty as if you heard that part of his history from his own mouth." Of the numerous female adventurers who resort to this settlement, with the hope of a speedy matrimonial connection, few retain beyond a season the bloom of health. Consumptions are very common among them; and many, after remaining for years in a single state, are forced to abandon the forlorn hope, and return to Europe with an impaired constitution and the loss of beauty, often their only recommendation. Diseases, however, are not so prevalent in this city as formerly, which is owing more to the greater temperance in the use of spirituous liquors, and the superior construction of the houses, than to any material improvement in the atmosphere. The inhabitants are now also better acquainted with the means of counteracting the effects of a bad climate; and from the increased knowledge of medicine, the nature and treatment of the peculiar disorders of the country, have been more precisely ascertained. But notwithstanding these improvements, much still remains to be done with respect to their manner of living. No fashionable parties sit down to dinner before seven or eight at night, which, in this hot climate cannot fail to be prejudicial to the health, particularly when we consider that, even independent of a loaded stomach, it is at all times difficult to procure any thing like a refreshing sleep. In the numerous and gay society of this capital, too many opportunities occur of exceeding the bounds of strict sobriety; and though few people indulge less in this respect than the inhabitants of Calcutta, yet the frequency of the application, often proves a most destructive enemy to the constitution. In no country ought the advice of the poet to be more strictly adhered to:

***'By the sense Of light refection, at the genial board, Indulge not often; nor protract the feast To dull safety.***

***For know, whate'er Beyond its natural fervor hurries on The sanguine tide; whether the pregnant bowl, High season'd fare, or exercise to toil Protracted; spurs to its last stage—fled life.'***

**Art of Preserving Health.**

Calcutta was first erected into an European settlement in 1690, when Mr Job Charnock, the Company's agent in Bengal, obtained leave from the Mogul to remove the English factory from Hoogly; and he fixed upon this spot as the most proper for its new situation, without any regard either to the convenience of its approach, or the salubrity of the climate, but merely, it is said, on account of a large shady grove which stands in the vicinity. Notwithstanding its disadvantages, however, it gradually increased both in population and opulence; and about the middle of the following century, fifty or sixty European vessels were annually loaded with rich cargoes at its port, besides other small craft trading to the adjacent countries. The colony had hitherto enjoyed the countenance and protection of the native powers, but on the death of the old Soubah, or viceroy of Bengal, in 1756, his adopted son, Suraja Dowlah, by whom he was succeeded, formed the design of driving the English from the country. Led on by the hope of a rich plunder, which he supposed to be concealed in the fort of Calcutta, he commenced hostilities upon the most frivolous pretences, and invested the English factory of Cossimbazar. Fraud and force were both employed for its reduction, which was soon accomplished, and the Soubah then marched to Calcutta with an army of 70,000 horse and foot, and 400 elephants. He was repulsed in repeated attacks upon the redoubts with great slaughter; but the governor, Mr Drake, intimidated by the superiority of his force, withdrew his troops from the outposts, and abandoning the city to the enemy, retired within the fort. In a council of war, it was declared, that their ammunition was almost expended, and that what remained was scarcely sufficient for three days. In consequence of this information, Mr Drake, who declared himself a Quaker, with some principal persons residing in the settlement, and part of the garrison, took refuge on board the ships in the river. The command of the fort then devolved upon Mr Holwell, who, with a few brave officers and a feeble garrison, consisting only of 250 effective men, maintained it with uncommon bravery and resolution, against all the force of the Soubah. Their ammunition, however, being at last, almost exhausted, and many of their numbers having fallen in the unequal contest, Mr Holwell hung out a flag of truce; and intended to avail himself of the opportunity to escape to the ships, but they had fallen several miles down from the fort, without leaving a single boat to facilitate the escape of its brave defenders. In this emergency also, before an answer could be received from the Soubah, the Dutch guard had betrayed their post, and had delivered up the back gate to the enemy, who rushing in, soon overpowered the garrison by their superior numbers. At an interview which Mr Holwell had with the Soubah, that prince promised, on the word of a soldier, that no injury should be done to any of the prisoners. But, notwithstanding this solemn assurance, they were all driven, to the number of 146 persons, of both sexes, into a dungeon called the black hole, a cubical space of about 18 feet; where, fatigued with hard duty, and many of them wounded, they were left to the torments of thirst and suffocation. Humanity shudders at the very idea of their miserable situation,—cooped up in a narrow cell, in a close sultry night, under such a climate as that of Bengal, without the least current of refreshing air. Two windows towards the west, which were strongly barred with iron, were the only openings at which the air could be admitted, and here there was no perceptible circulation. Enraged at finding themselves thus cruelly betrayed, they endeavoured to break open the door, determined rather to rush upon the swords of the barbarians, than remain exposed to an excruciating death; but the door being made to open inwards, all their efforts were unavailing; Mr Holwell, who stood at one of the windows, sc-
Calcutta.

costed a jemmutadarr, or serjeant of the Indian guard; and promised him a thousand rupees, if he would remove one half of them into a separate apartment. The soldier, allured by the offer of such a reward, immediately retired for the purpose of obtaining permission from the Soubah, but the tyrant was a slave, and no person dared to disturb his repose. Despair and distraction now seized upon these miserable sufferers. A profuse perspiration overspread every individual, and this was attended with a raging thirst, which increased in proportion as the body was drained of its moisture. In vain they stripped themselves of their clothes; in vain they sat down upon the ground, and put every hat in motion to produce a refreshing undulation. Many of them falling down, were instantaneously suffocated or trodden to death. A difficulty of respiration succeeded, and every surviving victim gasped for breath. New efforts were made to break open the door, but in vain. Execrations and abuse was then poured upon the guard, with the hope of provoking them to fire into the prison. Their sufferings now became intolerable; and the cry of a "water! water!" issued from every mouth. The jemmutadarr was even touched with pity at their distress, and ordered some skins of water to be brought; but, the only way of conveying it being through the bars of the window, in hats, and every one struggling for a share, the greatest part of it was lost. While those who stood near the windows caught a little, none reached their companions at the other end of the prison, who besought them, in the most moving strains, to send them some relief. The water, however, instead of allaying the thirst of those that received it, only heightened their delirium, and enraged their impatience for more. A horrid scene of confusion ensued. Such as were at a distance, rushed towards the window, crying out for water. In the contest, many were pressed down and trampled to death. The barbarians without laughed at their miseries, and as they supplied them with water, held up lights to the bars that they might enjoy the inhuman pleasure of seeing their hapless victims contending for the baneful indulgence. It was about eight o'clock when they were first entombed in this infernal place; and before eleven, one third of them had perished. Mr Holwell, who found himself so closely wedged up by the pressure towards the window, as to be incapable of motion, begged, as the last token of their regard, that he might be allowed to retire from the crowd and die in peace. Even here respect was shown to his rank and character. The pressure was removed, and he retired to the farther end of the prison, where, seeing many of his particular friends lying dead, he laid himself down among them, and recommended his soul to heaven. His thirst, however, grew insupportable, his difficulty of breathing increased, and he was seized with a violent palpitation. He forced his way back to the window, exclaiming, "Water, for God's sake!" His wretched companions again gave way, and manifested a proof of tenderness and attachment to his person, that could scarcely have been expected in such dreadful circumstances. "Give him water," they cried; and though raving in agony, none of them would touch it until he had drank. Being somewhat relieved, the palpitation ceased; but finding that water increased rather than diminished his thirst, he abstained from it, and moistened his mouth by sucking the perspiration out of his shirt-sleeves, or catching the drops as they fell from his head and face. * The rest having also discovered the pernicious effects of water, now grew clamorous for "air;" and the most opprobrious abuse was repeated upon the Soubah, his officers, and the guard, in order to force them to fire. A general prayer was then directed to heaven to put a period to their misery. They now began to drop on all sides. Many died standing, being upheld by the crowd around them; and the steam which arose from the living as well as the dead, was so pungent and insufferable, that all who could not approach the windows were suffocated. Mr Holwell had again retired; and stretching himself by the side of the Rev. Mr Jerris Bellamy, (who, with his son, a lieutenant, lay dead in each other's arms), where he remained deprived of sense, and to all appearance lifeless, until day-break. Being then discovered by his surviving friends, he was removed to the window, where the fresh air revived him. The Soubah having been at last informed of the havoc which death had made upon his miserable victims, sent to inquire if the chief was still alive, and upon Mr Holwell being shown to the officer, an order came immediately for their release. Of the 146 that entered alive, 23 only returned, and most of them in a high putrid fever. Even their deliverance, however, was dictated not by pity, but by avarice; for the Soubah had received intimation that Mr Holwell knew of a considerable treasure which was secreted in the fort; and it was for the purpose of questioning that gentleman upon the subject, that he summoned him into his presence. Mr Holwell, however, solemnly declared that he knew of no such deposit; but the inhuman tyrant would give no credit to his protestations, and ordered him, together with three of his friends, to be loaded with fetters, and conveyed to the Indian camp, about three miles distance. Here they lay all night, under a heavy rain, and were marched back next morning to Calcutta, exposed to the scorching beams of a tropical sun. They would infallibly have sunk under their affliction, had not nature expelled the fever in large painful boils, which overspread almost the whole body. In this condition, they were carried in an open boat to Mooshedabad, the capital of Bengal, about 100 miles up the Ganges, where, after enduring the most cruel and opprobrious treatment, they were set at liberty, through the mediation of the Soubah's grandmother. When the order was given for their release, some of the courtiers represented to the Soubah that Mr Holwell was still able to pay a considerable ransom; he replied, with some marks of compunction, "if he has any thing left, let him keep it: his sufferings have been great; he shall have his liberty." Having laid Calcutta in ruins, and dispersed its inhabitants, the Soubah stationed a

* In his despair of obtaining water, this unfortunate gentleman, we are told, had attempted to drink his own urine, but found it intolerably bitter; whereas, the moisture from his body was soft, refreshing, and pleasant.

VOL. V. PART I.
strong garrison in the fort, and returned to his capital. This cruelty, however, was soon to be retaliated upon its inhuman author. In the following year, Admiral Watson and Colonel Clive retook Calcutta; and the latter officer having defeated the Indian forces at Plassey, marched to Moorsheadbad, when Sarnja Dowlah was deposed, and soon after put to death. His successor having entered into a firm alliance with the British, paid a vast sum to the Company and the sufferers at Calcutta, as an indemnification for their losses; and the trade of this city being relieved from the high duties which had been formerly imposed upon it by the native princes, increased so rapidly, that Calcutta soon became the most flourishing European settlement in India. About twenty years ago, during a famine, the population of this city was estimated at 500,000; but, according to Lord Valentia, it now amounts to nearly 700,000. North lat. 22° 39', East long. 88° 28'. See Kennell's Memoirs; Tennant's Indian Recreations, vol. i. p. 37, &c.; Lord Valentia's Travels, vol. i. p. 235, &c.; A Voyage to India, China, &c. in 1803-1805, in Phillips's Call. of Voyages, &c. vol. v.; and Foster's Travels, vol. i. p. 9. (p)

CALDERWOOD, DAVID, a celebrated divine of the church of Scotland, was born, as appears from Baillie's Letters, in 1575. He was, from his earliest years, destined for the ministry: and accordingly his attention was peculiarly directed to the study of divinity, in which, while yet a very young man, he had made the most respectable attainments. He wisely devoted a large portion of his time to the investigation of sacred scripture in the original languages, and in this investigation, he did not despire the aid which was afforded by critics and commentators. He also read the works of the Fathers, and the best books which could be found on the ancient and modern history of the Christian church. The learning which he had acquired procured for him very general respect; and his zealous attachment to the church of Scotland, which at that time was of the Presbyterian form, rendered him extremely acceptable to most of its faithful ministers. About the year 1604, he was settled at Craling, in the neighbourhood of Jedburgh; where, by his private virtues and public fidelity, he recommended himself to the love of his people, and to the reverence of all who knew him. It was while in this situation that he gave the first decisive proof of his dislike to Episcopacy, and of his determination to adhere stedfastly to the ecclesiastical system which he had embraced. James I. of Great Britain, with his characteristic bigotry and imprudence, endeavoured to bring the church of Scotland into a conformity with that of England; and with that view, he sent the Earl of Dunbar, then lord high treasurer, accompanied by three divines, to reconcile the ministers and laity to the projected change. These tyrannical and insidious attempts of the monarch, experienced the most vehement opposition; and none was more eager and resolute in opposing them than Mr. Calderwood; for when the Bishop of Orkney came (1608) to visit the Presbyteries in Merse and Tiviotdale, he, along with Mr. Johnston of Aucrum, solemnly declined his jurisdiction under form of instrument. The perseverance of the king, aided by the corrupt influence and subtle policy of his agents, was at length successful. Mr. Calderwood, however, continued to bear his open testimony, and employ his best endeavours against those despotic and illegal measures which were successively adopted to accomplish the royal scheme. And as he was not tempted by those preferments which a man of his talents and influence might reasonably have expected under the new ecclesiastical regime, so neither was he induced by the threatenings and persecutions to which he was soon after subjected, to abandon the principles and the conduct which he had hitherto maintained. Of the Assembly held at Glasgow in June 1610, and of that held at Aberdeen in August 1615, he explicitly declared his disapprobation, because they acted under undue influence, and were guilty of unconstitutional proceedings. When the king held a parliament at Edinburgh in May 1617, there was also a meeting of clergy assembled at the same time, to hear and consult with the bishops, evidently by way of imitating the convocation in England. Mr. Calderwood went "to try what the ministers there convened were consulting upon;" and, in allusion to what was passing, boldly stated, that he could not look on that meeting either as a General Assembly, or as bearing any resemblance to the English House of Convocation, reminded them of their hostility to the church, and of their violation of promises made in its favour; and when interrupted by two members, he left them with these words, referring to their proposals about augmentation of stipends, "It is absurd to see men sitting in silk and satins, and to cry poverty in the lark when purity is departing."

The parliament having assumed the prerogative of regulating the ecclesiastical as well as the civil affairs of the kingdom, a considerable number of the ministers resolved to give in a protestation against this encroachment on their peculiar rights. Mr. Archibald Simpson was appointed to draw it up, and to sign it on behalf of the ministers who had proposed or acquiesced in the measure; he receiving as his warrant and justification, a separate roll which contained their individual subscriptions, amounting to no fewer than fifty-five. This protest was presented by Mr. Simpson to the clerk register, but he refused to read it before the states in parliament. A copy of it is given in Mr. Calderwood's printed History of the Church of Scotland: and though it is sufficiently respectful in its form and language, yet it breathes such a spirit of dissatisfaction with the conduct of parliament, so plainly accuses the king of having acted contrary to his engagements, and so calmly and resolutely refuses to yield obedience whatever the consequences might be, that it could not fail to offend and irritate a prince so fond as James was of arbitrary power both in church and state. Accordingly, Mr. Simpson was summoned before the High Commission Court, and requested to produce the list of names with which he had been entrusted, that steps might be taken for punishing the most refractory of the protestors. The list had been given to Mr. Calderwood, who was therefore ordered to appear before that court, at St. Andrews, to exhibit the roll there, and to answer for his seditious and tumultuous conduct. He obeyed the summons, and appeared on the day appointed. The king attended
in person, and behaved with his usual arrogance, officiousness, and severity. He entered into a dispute with Mr Calderwood respecting the merits of the protestation, and the part which he had taken in that transaction. He dogmatized about the rights of a General Assembly—illustrated the duty of obedience by the language of the Centurion in the Gospels—pressed Mr Calderwood to conform, by the use both of promises and threatenings—swore by his *gude faith*, that he was a very knave, like the rest of the false puritans, who were ever playing with equivocations; and finding that the object of this abuse was too firm to be drawn aside from his integrity and his duty, and a more acute disputant than a royal personage could safely encounter or patiently brook, he ordered him to be sent prisoner to the tolbooth of St Andrews, from which he was afterwards removed to that of Edinburgh. The privy council then directed him to banish himself out of the king's dominions before the following Michaelmas, and not to return without licence. On giving security farther, he was allowed to go back to his own parish, but forbidden to preach: And after an application on the part of Lord Cranstoun, who was his security, to have the punishiment changed into that of confinement to his own parish, which was unsuccessful, because he would not acknowledge an offence of which he had not been guilty, or make promises which his conscience would not allow him to fulfil, he at length retired into Holland, in which country he remained for several years. Having contrived to get his departure deferred till the month of August, 1619, he took the opportunity afforded him by this delay, of writing a book called *Perth Assembly*, which was condemned by the council in the December following, when happily the author was out of their reach. Thomas Cathkin, printer in Edinburgh, was cited to London on a charge of having printed this work. The following is a part of his examination, on the 15th of June 1619, before the king and some of the bishops. *"Has not Mr David Calderwood lived and been entertained at your house?" said James. "He would not," answered Cathkin, "rescuse anie entertainment from me, and did liy vere rarelie with me."* King, "Did he not ly at your house since he was banished?" Cathkin, "Please your majestie, vere rarelie."—King, "Hold up your hand, and say as ye shall answer to God, how short time is it since you did speak with Mr David Calderwood?"—Cathkin, "Your majestie doth strait me vere hardlie. I must needs gather my memorie before I can tell your majestie."—"Then", says Cathkin, "the king did swear I was going to equivocate; but presentlie I did remember myself, and said, I did speak with him within these fifteen daies. We have found the ——; let us haud us here: forsooth Mr David Calderwood is a good brother and an good leir father. With this his majestie did rise in a great rage, leaned on a table hard by; and presentlie did sit down again, and said unto me, "Traitor, thief, how durst thou receive my rebell?" Cathkin, "He was not your majestie's declared rebell," King, in girt rage, "Did thou not know that I banished him?" I was so dasched with his majestie's wrath; forgot to tell his majestie that Mr David had gotten an oversight."

"During his exile in Holland, he produced in 1628 the *Altare Damascenum*. This book is a refutation of Linwood's *Description of the Policy of the Church of England*. It treats, however, not only of the particular subject brought under discussion by that work, but also of the general questions at issue between Presbyterians and Episcopalian, and endeavours, by the help of much learning and of many arguments, to demonstrate, that the system of the former rests upon a foundation to which that of the latter has no just pretensions. It attracted great notice when it appeared; and while it gave high satisfaction to those whose opinions it supported, it gave equal uneasiness and displeasure to those on the opposite side of the controversy, though all united in acknowledging its erudition and ability. King James himself read it, and at once admired it for its lore, and disliked it for its success. It is said that a prelate observing him somewhat pensively and surly after perusing it, besought his majesty not to trouble himself, for it would be answered; but that the king passionately replied, "What the Devil! will you answer, man? There is nothing here but scripture reason and fathers." It long continued to be a sort of armoury to the non-conformists, and it is often referred to and generally applauded by writers of that class. In the present day, however, it is not held in such high esteem; though certainly none can be said to be very deeply versed in the subject which it so ably discusses, to whom its pages are not more or less familiar.

It is not generally known that the *Altare Damascenum* is an enlargement, in Latin, of a work which Mr Calderwood wrote in English, and published in 1621, under the title of *The Altar of Damascus, &c.* This work, indeed, is extremely rare. The copy of it which we have seen, is in the possession of a gentleman in Edinburgh, and is the only one which we know to exist. It concludes with noticing a rumour spread by bishop Spettiswood, that Mr Calderwood had turned Brownist; which rumour it denies in strong language, and with bitter reflections upon the bishop. "If either Spottswood," says Mr Calderwood, "or his supposed author, persist in their calumny, after this declaration, I shall try if there be any blood in their foreheads."

A curious attempt was made in the year 1624, to bring Mr Calderwood into disrepute, and probably through him to lessen the popularity of his ecclesiastical system. Mr Calderwood had been long sick, and as no accounts of him were received for a considerable time, people generally concluded that he was dead. Taking advantage of this belief, one Patrick Scott, a gentleman near Falkland, who had wasted all his patrimony in dissipation, and was ready to serve the court in any thing for a reward, took it upon him to write and publish a recantation, in the name of Mr Calderwood. It is asserted by Mr Calderwood himself, upon what authority he does not say, that the king furnished Scott with the matter, which he put into the pretended recantation. One is almost tempted to believe this meanness of a king, who had already been guilty of measures as despicable, and who could scarcely desire any thing more earnestly, than the disgrace and defeat of the Presbyterians. What followed, however, was still more criminal, though not more successful. When it was discover.
ed that Mr. Calderwood was alive and disclaimed the recantation, the infamous Scott, whether instigated by the king or not, cannot be known, went over to Holland, and sought for the innocent object of his vengeance, with an intention to assassinate him. In this diabolical purpose, however, he failed; for Mr. Calderwood had, in the mean time, privately returned to his native country.

Mr. Calderwood was the author of several works besides those which we have mentioned, on the transactions and controversies of the times. Of these, we cannot pretend to give a complete list; but the following may be considered as the greatest part of them: The Speech of the Kirk to her beloved Children; the Confutation of Dr. Mitchelson's Reasons for Kneeling; The Course of Conformity; An Epistle to a Christian Brother; A Dispute against Communicating where there was Kneeling, confusion of Gestures and Actions; The Antithesis between the Pastor and the Prelate; A Defence of the Arguments against Kneeling at the Sacrament; Queries concerning the State of the Church of Scotland; An Exhortation of the particular Kirks of Christ in Scotland, to their Sister Kirk in Edinburgh; De Regimine Ecclesiae Scoticae; brevis Relatio, or Hieronymi Philadelphi De Regimine Ecclesiae Epistola; Ejusdem Viudice contra Calumnias Joh. Spotswodi; The Solution of Dr. Resoldus's Resolutions of Queries and Exhortations. Several of these works were printed in Holland; and when they were about to be imported into Scotland, a proclamation was made at the cross of Edinburgh, bearing, that certain persons were attempting to bring into the kingdom a number of seditious and treasonable books, and commanding all ships coming from the low countries to be carefully and diligently searched, that the said books might be examined and condemned. This attempt, however, to accomplish by violence what could not be so easily obtained by argument, fortunately did not succeed; for Mr. Calderwood's books were safely landed some days before the vessel containing them could be searched.

Mr. Calderwood employed himself with great diligence and success in collecting and digesting, according to the order of time, all the memorials which could be procured relating to the ecclesiastical affairs of Scotland, from the beginning of the Reformation down to the death of King James VI. We are told by Baillie, that a great part of a session of the assembly in 1648 was spent in encouraging Mr. Calderwood to perfect his church history, and that they agreed to give him out of their funds no less than L.800 Scots yearly, to enable him to proceed with it. This valuable work is still in manuscript. There are four copies of it. One of them is in the college-library of Glasgow; another is in the advocate's library of Edinburgh; a third is in the possession of General Calderwood Durham of Largo, who is the representative both of the family of Mr. Calderwood, and of that of the pious Mr. James Durham, minister of Glasgow; and the fourth belongs to the General Assembly of the Church of Scotland, to whom it was presented by Mr. Wodrow, having been carefully transcribed from the original manuscript under his own eye.

Every person who is at all acquainted with the productions of those who have written on the Scottish Reformation, must be aware of the importance and utility of Calderwood's manuscript volumes; and it is matter of regret, that the expenses necessarily attending the publication of them would be so heavy as to render that a very difficult and hazardous undertaking. We cannot refrain from suggesting, that enterprises of greater risk have been attempted in the literary world by subscription, and have succeeded. From this large work an extract has been published, under the title of The true History of the Church of Scotland. The matter is important, but the style is homely and uncouth. It must be observed, however, that this was not drawn up, as is generally believed, by Mr. Calderwood himself, whose compositions are quite superior in every respect; it is the production of one of the ministers who lived in the time of the persecutions which took place under the reign of Charles II. Many copies of the work, indeed, will be found with the date 1704: but this is a device of the publishers, who were accustomed at that period to renovate a book merely, by giving it a new title page. The title page, too, it should be noticed, bears, that the work was written at the appointment, and received the countenance of the General Assembly; whereas this applies not to the printed, but the manuscript history of Mr. Calderwood.

The exact period at which Mr. Calderwood returned from Holland is not ascertained. It is probable that he did not return till towards the year 1636, no mention being made of him in any record of ecclesiastical transactions in this country previous to that date. He lived for some time as privately as possible. His residence was chiefly in Edinburgh, where he equally opposed sectarianism, and encouraged nonconformity. Though he was not a member of the General Assembly held that year at Glasgow in 1638, when Episcopacy and the late innovations were combated, yet it appears that he took a part in the proceedings, lodging secretly beside the moderator's chamber, and writing papers, which were afterwards read in court, in defence of the rights of ruling-elders to sit as members of Assembly. He also appeared in the Assembly in 1641; and, though no member, delivered his opinions upon the business with so much freedom and keenness, that the commissioner commanded him to be silent. The moderator, however, took occasion to mention his great services to the church—to regret that he had been so long neglected—and to recommend him to the "first commodious room." Mr. Baillie remarks, that his promotion was not likely to take place soon, because he had, by his misconduct on this occasion, given great offence to his former benefactors and patrons. It was not very long, however, after this, that he received the church of Pencaitland, in East Lothian; but at what precise date, cannot be determined. The authors of the Biographia Britannica affirm, that he was minister there in 1638; and, in proof of this, refer to the preface to the last edition of his Altare Damascenum. But neither in that preface, nor in any other printed document, is there any allusion whatever to the fact. Mr. Calderwood was nominated, along with Mr. Henderson and Mr. Dickson, by the Assembly, 1643, to prepare
and Anandale, without informing us upon what authority they so denominate the southern districts. We know from Xiphilin, that, in the 3rd century, the Maet and Caledonians were the two most powerful nations of Britain; and that of the two, the Caledonians occupied the more northern situation, while the other bordered on the Roman province; both of them, however, occupying barren mountains and savage plains. Ptolemy, in the second century, places the Caledonians in the most mountainous district of Scotland, making them to extend from the Lelamontius Sinus, supposed to be Lochin, as far as the Murray frith; thus assigning them all that central country composed of the higher districts in the counties of Perth, Angus, Moray, Inverness, and Argyle. The information of Ptolemy seems to have been collected with great care, as he enumerates the smaller nations by whom Caledonia was on all sides surrounded, together with the towns, rivers, and promontories of the country. With both these authorities, Tacitus, in the first century, by far the best informed of all the writers who have taken notice of the Caledonians, perfectly coincides in placing that most renowned nation considerably to the north of the Forth and Clyde.

A bare inspection of this author's journal of his father-in-law's campaigns, will make it perfectly evident, that the Romans had conquered all the nations to the south of the two great sectaries; that they had crossed that of the Clyde, and conquered several tribes of Dumbartonshire and Cowal; that they had crossed the Forth, advanced far into Fife, nay probably had reached the Tay, before they had so much as seen the Caledonians. It was only in the seventh campaign of Agricola, and the fourth after that general had entered the supposed Caledonia of the antiquaries, that he first came in contact with these terrible mountaineers, when they surprised and nearly destroyed the ninth legion. This conflict took place beyond the Forth, and several days march after leaving Agricola's line of forts; and yet it was on this occasion that the Roman soldiers, now recovered from their terror of the so much vaunted Caledonian arms, and flushed with their success in this first encounter, for the first time demanded, "pene-trandam Calediniam," to be conducted into Caledonia itself. The highest authorities, therefore, historical and geographical, and the only authorities that can be attended to, because formally treating of the subject, concur in restricting the limits of Caledonia to the fastnesses of the mountains. It is no doubt convenient for particular theories that twenty-one nations should be palmed upon us under the same general name, and that a disposition should thus be produced in the mind to consider them all as of the same family; but that writer must be pitifully addicted to system that would oppose, to the direct authorities now cited, the vague epithet of a poet, or the casual expression of a declaiming rhetorician.

It is remarkable, that Tacitus, in his Life of Agricola, uniformly mentions this nation by the general name of "Britanni," and of the tribes inhabiting Caledonia," but never calls them Caledonians. Subsequent authors give them the appellation of Caledonii and Caedones. According to Cambden, the name Caledonia is derived from the Welsh kaled, denoting hard, rough, uncivilized. Buchan.
traces it to the word *caleden,* or hazel, which gave
its name to Duncaleden or Dunkeld, whence the
country might have received its denomination. Mr
Chalmers, in his late interesting work, deduces it
from the British Celyddon, woody, mountainous,
wild. For our own part, after all the etymologies
which we have seen, we are disposed to think that
none is so consistent, either with the sound or with
the sense, as that which comprehends the name by
which the inhabitants of Caledonia call themselves
to this day. The word Gaël, as every one knows, is
merely a modern and vulgar contraction for Gaid-
heil, Guydheil, or Gatheil, in all which forms it
occurs. In a most ancient fragment, preserved by In-
nes, the Scots are called *Gadell.* The Irish still
call the Highlanders, Guydheil, and the Welch give
them the name of Gwyddil, a term which the same
people applied to the Picts of old, calling them
Gwyddil Phicthi. Gadel-doine, or Gaël-men, there-
fore, is as nearly represented by Caledonii, as could
be expected from a Roman pronunciation. According
to Mr Chalmers himself, the name Gwyddil has al-
ways been applied by the British to the inhabitants
of mountains; and is synonymous with his own
Celyddoniaedd.

The fame of the Caledonians had reached Rome
long before the arrival of Agricola in this island,
though that general was the first who actually came
in contact with them. After having, in the preced-
ing campaigns, conquered the country south of the
Forth and Clyde, secured his conquests by establish-
ing a line of forts between these two rivers, and con-
quered several nations till then unknown, on the
northern shores of the western estuary, Agricola, in
his sixth campaign, resolved to invade the "powerful
states," as Tacitus calls them, "beyond the Forth." This
expedition was conducted both by land and sea, the army marching along the coast, and the fleet,
by way of precaution, attending them. Having pro-
ceded in this order for many days, along the shores
of Fife, engaging in frequent actions with the natives,
and conquering the country, they seem to have esta-
blished themselves in these quarters for the winter;
for we may gather from Agricola's speech, that the
action of the ninth legion happened the summer pre-
ceding the great battle, which was on the eighth
year of Agricola's wars in the island.

Whilst the Romans were thus engaged in the con-
quest of Fife, Stirling, and the lowlands of Perth
and Angus, distracting the attention of the natives
by the manoeuvres of their fleet along the coast; the
tribes of Caledonia took the alarm, entered into a
formidable confederacy, and were reported to be ac-
tually on their march from the westward to attack
the line of forts in the rear of the Romans. The
tribes inhabiting Caledonia, says Tacitus, rising in
arms with a vast preparation, increased by fame, *uti
mos est de ignotis,* as is the case concerning unknown
nations, being reported to have attacked the forts,
inspired the greatest terror as having commenced of-
sensive operations. Many of the Romans were ac-
cordingly now for returning to this side the Firth of
Forth, *regretendum certa Bodotram,* lest they
should be disgracefully driven back by this new enemy.
But Agricola, no ways intimidated, dividing his army
into three divisions, marched during the seventh cam-

paignment across the country, from the eastern coast, to Caledonia.
prevent their attempts upon his fortifications on the
isthmus. The Caledonians perceiving they could not
cut him off from his lines, suddenly changed their
plan, and falling unexpectedly with their whole
force upon the ninth legion, in the night time, nearly
overwhelmed it. They were already within the
camp; but Agricola, informed of their route, had
previously dispatched the swiftest part of his troops,
horse and foot, to harass their rear. In the mean
time, he himself proceeded by forced marches to the
relief of the legion, and the Roman standards ap-
ppearing at the break of day, and the Britons being
attacked in front and rear, a dreadful conflict ensued
in the gates of the camp. The Caledonians were
thus compelled to relinquish their prey, and made
the best of their way into the fens and fastnesses.
Those of the Romans who were formerly terrified
at the approach of these formidable and new antago-
nists, and wished to retreat, were now so elated by
this victory, that flying into the opposite extreme,
they were for penetrating directly into Caledonia.
We are not informed what were the further achieve-
ments of Agricola this summer, nor where he quar-
terred his troops during the winter. His next ap-
ppearance in the field, was in the following year,
towards the end of summer, when the great battle of
the Grampians took place, being the eight year
since his arrival in Britain, and the 85th of the Chris-
tian era.

The Caledonians, no ways disheartened by their
late failure, had spent the remainder of that season in
preparing for the succeeding campaign, by providing
places of retreat for their wives and children in case
of an invasion, arming and organising their youth,
forming alliances which they ratified with religious
rites, and holding consultations and councils, in which
they mutually exasperated each others minds against
the common enemy; and having arranged these mat-
ters, they separated for the winter. When Agricola
took the field, he at the same time sent his fleet
along the coast, which, by making frequent descents
and predatory excursions into the country, might
distract the attention of the confederates. These,
however, were not deficient either in zeal or conduct.
Mustering probably the whole of their forces, to the
amount of 30,000 combatants, they awaited towards
the end of autumn, the attack of Agricola at the
foot of the Grampian mountains. This army consist-
ed of the flower of their youth, and of men inured to
war, commanded by their greatest chiefs, each bearing
his trophies and his badges of honour. Among these
Gallicus, as being pre-eminent in valour and lineage,
held the chief rank, and acted as commander. The
Caledonians were drawn up on the face of a hill, one
line rising above another from the plain, thus making
a magnificent as well as terrible display of power to
their enemies. The level grounds in front were
scoured by their cavalry, intermixed with armed char-
riots. The Romans, on their side, were drawn up with
consummate skill; 8,000 foot auxiliaries composed
the main battle; 3,000 cavalry protected the wings;
while the legionaries, probably consisting of as many
more troops, were stationed in the rear—a bulwark,
says Tacitus, in case of a repulse, an honour to the
leader should he be able to render unnecessary the
Caledonia. effusion of Roman blood. After an energetic speech from each of the generals to their respective armies, the light troops, on both sides, began the battle by a general discharge of their javelins. The Caledonians, while at a distance, displayed much address in avoiding and parrying these with their small bucklers and huge swords, while they at the same time overcame their antagonists with showers of darts; but they could not withstand the close onset of some German heavy armed foot, who drove them up the hill sword in hand. The other cohorts, following the example of these Germans, fell upon the whole front of the Caledonians, and threw their horse, infantry, and chariots, into inextricable confusion, and a terrible slaughter ensued. In the mean time, however, the Caledonians on the higher grounds made a stout effort to turn the enemy, and attack them on the flanks and rear; but the Roman cavalry observing this movement, attacked these insulated bodies on all sides, and put them to the rout. Though the day was now irrecoverably lost, and the Caledonians were treated in all directions, yet the fight was kept up with great obstinacy, and the foremost of the Romans paid dear for their temerity. In this great battle, so honourable to the valour of our ancestors, 10,000 of the Caledonians, by the Roman accounts, remained upon the field, while the enemy are said to have lost but 350 men; a return in which it is probable the legionaries only are included.

The Caledonians had committed a great error in giving Agricola battle at that late season of the year, when they might easily have starved him out of their country; but this might proceed from their not being aware of the discipline of the Romans. Though unfortunate in this trial of their strength, they did not, however, tamely yield to their conquerors. Immediately after their defeat, they adopted the politic measure of laying waste their country, and burning their houses and effects, to deprive the Romans of all means of subsistence. It is even added, that they put to death those of their wives and children whom they could not carry away, to prevent their falling into the enemy's hands. The probability is that Roman vanity has greatly exaggerated the loss of the Caledonians. One thing, however, is certain, that Agricola retreated immediately after the battle, owing, according to Tacitus, to the lateness of the season, but more probably to the danger of wintering among these hostile and high spirited tribes. Agricola withdrew his army by slow marches, intending by that means to display to the new nations the severe loss sustained by the Caledonians, as not being in a condition to molest his retreat; and, having exacted hostages of the Horesti, supposed to be the inhabitants of Fife, he sent his army into winter quarters, probably in the districts to the south of the Forth and Clyde. It was during this campaign that Agricola ordered his fleet to circumnavigate the island, in order to terrify the tribes of the north with the greatness of the Roman power.

As a proof that the Romans had hitherto acquired but a momentary footing on the frontiers of Caledonia, we have only to consider the state of things in A.D. 121, 96 years after the battle of the Grampians, when we find Hadrian building a wall between the Tyne and the Solway, to restrain the incursions of the Caledonians, and of their allies the Mæctæ, a new denomination of people, who seem to have inhabited the country near Agricola's lines. About 17 years thereafter, the Mæctæ being vanquished in several engagements, by Lollius Urbicus, their country was again occupied by the Romans, and the lines of Agricola were fortified anew, with a rampart and ditch. This defence, thenceforward called the wall of Antoninus, because built in his reign, was intended as the boundary of the empire; but the Caledonians in 180 broke through it, and being joined by the Mæctæ, carried fire and sword into the Roman province. We find the same confederates again in 198 pursuing the same career of rapine and desolation; when Lupus, the general of Severus, not being able to make head against them, had recourse to the dangerous expedient of bribing them to return, and ransom their prisoners. This, as might be expected, was but a temporary remedy. The Caledonians renewed their ravages with more fury than ever, so that the presence of Severus himself became necessary. His arrival, in A.D. 207, with a powerful force, so alarmed the confederates, that they sent ambassadors to the emperor to propose an accommodation; but their offers were rejected. Severus, with an immense army, took the field in person, resolving to penetrate to the furthest extremity of the island, and put an effectual period to the power of the Caledonians. Our ancestors, taught by their former experience, adopted on this occasion a mode of defence peculiarly suitable to their circumstances, and allowed the enemy to waste his strength in contending with the natural difficulties of the country. Severus, we are told, employed in this expedition a great part of his troops in cutting down the forests and draining the marshes, in which the natives suddenly disappeared when pursued by the Romans, and in constructing roads and bridges for the conveyance of supplies; the remainder of his forces he employed in protecting the workmen from the incessant attacks of the Caledonian skirmishers. These never appeared in a body, but contented themselves with hanging on his line of march, and intercepting his supplies, and with desultory attacks and ambuscades, by which the enemy suffered excessively. The emperor lost in this expedition no fewer than 50,000 men, without a single battle, and even without having seen the enemy in a body. Severus, however, by the most incredible perseverance, at last penetrated into the heart of the country, which probably had never till then seen a foreign enemy; and compelling the Caledonians to lay down their arms, deprived them and the Mæctæ of a part of their territory. The dear bought success of this expedition was unquestionably not adequate to the original intention of Severus, for upon withdrawing his army to the south, we find him employing his troops, for the space of two years, in constructing his famous wall; a pretty strong symptom of that independence still maintained by the Caledonians! An additional confirmation of their remaining vigour is furnished by another war, A.D. 210, when the Mæctæ and Caledonians, two years after the last pacification, availing themselves of the difficulties of Severus, made a formidable attempt to wrest the ceded territory from his grasp. The old emperor, who was at York upon the arrival of this intelligence,
gave orders for the utter extermination of the barbarians, without sparing the very infants in their mothers wombs. His death, however, prevented the execution of this cruel determination, and Caracalla, anxious to quit Britain, concluded a peace with the devoted nations. After this period little more is heard of the Caledonians: their name, in the pages of the Greek and Roman writers, falls gradually into disuse; and the population of their country, during the third century, begins to be known under the two celebrated denominations of Scots and Picts.

The Caledonians, according to the account of Tacitus, resembled the Germans in their large limbs, red hair, and blue eyes, differing remarkably in all these respects from the Silures, or inhabitants of Wales, who were of a darker complexion. They are represented by the writers of the second and third centuries, as having neither walls, towns, nor cultivated lands; subsisting by pasturage, hunting, and rapine, and on the wild fruits of their barren country. Hardy beyond belief, they are said to have gone naked, at least in battle, plunging, when pursued, up to the neck into their morasses, where they continued for several days without tasting food. In winter especially, and perhaps on all ordinary occasions, they have used, like the southern Britons of Caesar, the skins of beasts to protect them from the cold. They had a custom, in common with all the other natives of the island, of staining their bodies of a blue colour. This was done, at least in after times, with some degree of art, as the skin was punctured with a sharp instrument, and the colouring matter rubbed into it, so as to exhibit permanent lines and figures, in the manner of some of the South Sea islanders. The arms of the Caledonians were, a very long pointless sword, a small buckler or target, a short spear, having a knob of metal on one end, and a dagger. As far as we have read on the subject, they are not remarked as using bows and arrows. The coxcomb, or war chariot, used by the Caledonians, was probably armed with scythes and hooks, to cut down the ranks of the enemy. Upon the whole, the military apparatus of the Caledonians evinces a greater proficiency in the arts, than the writers of that period allow them. Their horses were small, but extremely active; and their infantry famous for their quick movements. The bravery and unsubdued spirit of our ancestors, whom the Romans could never bend to their yoke, and who, on that account, form a splendid contrast to the other nations of the world, are such as to give us just reason to glory in being their descendants, all barbarous and uncultivated as they were. Their manners seem to have been much of the same description as those of the southern Britons, before their subjugation by the Romans. Caesar says of these, that every ten or twelve men had their wives in common, and that the children were accounted to belong to him who had first married the mother. Nearly the same thing is said of the Caledonians, only that, in this case the children were brought up by the community, as being claimed by no particular man as their father. It has been ignorantly asserted, that the Caledonians had no houses, because they had no walls or towns: Tacitus expressly tells us, that after the great battle, they set fire to their houses. We suspect that if there exist any of those circular fortifications, called by Mr. Chalmers Pictish forts, within the proper limits of Caledonia, they must be accounted the work of a later period.* Both Dio and Herodian, as well as Tacitus, allow that Caledonia was inhabited by several distinct tribes. Of the Caledonian government, we know nothing more than that it was democratic, being probably a sort of federal union. Galgacus does not appear to have been a king; but merely a chief selected from many others, for his birth and talents, to conduct the operations of the campaign. (E)

CALEDONIA (New), an island in the South Sea, and, after New Holland and New Zealand, the most considerable that has yet been discovered in it. This island was first seen by Captain Cook in 1778. His survey of it extended no farther than to its northeastern parts. Twenty years afterwards, it was visited by M. D'Entrecasteaux, during his voyage in search of La Perouse, when a more extended observation was directed both to its coasts and to the interior. According to the account of the former of these navigators, it is situated between 19° 37' and 22° 50' Lat. S., and 163° 87' and 167° 14' E. Long. The position assigned to it by the latter is for the southern extremity, Lat. 22° 31' S., Long. 164° 30' E.; for the northern, Lat. 19° 58' S. and Long. 161° 10' E. Its length from S. E. to N. W. may be estimated at about 90 leagues; its greatest breadth does not exceed 10 leagues. The coast of this island is extremely bold, and difficult of access. Independently of the obstacle to an easy landing upon it, arising from the height and steepness of its own mountains, which, in some directions, extend even to the water's edge, it is on almost all sides environed with numerous rocks, islets, shoals, and sand-banks, which either form a continued chain, passing in the line of the shore, often at a considerable distance, and shutting it up completely from the open sea, or assuming the yet more dangerous aspect of numerous unconnected points shooting up irregularly from the surrounding deep. A principal chain of the connected rocks is that which skirts the southeast coast of the island, at a distance from the land generally of from two to three miles, still more in some situations, and thence proceeding, first in a southerly, afterwards in a westerly direction, to a distance from it of 20 miles or upwards. Towards the east and north, the islets and rocks appear chiefly in the more detached state just alluded to, forming as it were so many protruberances, issuing from the extended base of the principal summit in the island. The danger and the difficulty of navigation must in those parts, therefore, be peculiarly great, as many of these rocky points hardly rise above the level of the water; and they seem to extend outwards to a distance even beyond sight of land. The interruptions to this sort of irregular wall, if it may be so

---

* It is indeed remarkable, that the Roman and Greek writers make no mention whatever of sieges in the campaigns of Agricola and Severus in this country; so that the forts in question, if they then really existed, seem to have been totally useless as strongholds.
New

Caledonia

called, seem not to be considerable in any quarter round the whole compass of the island; or if the coast is any where left open to the sea, it is yet probable, that the environing bulwark of rocks is in such situations rather carried out to a greater distance, so as not immediately to come into view, than totally suspended. Several of these rocky excrescences are the production of a species of polypty. Some of them appear to be of a more permanent character, and of considerable magnitude. The Isle of Pines derives its name from the abundant growth upon it of that description of trees, which may hereafter prove an important resource for shipping, in a region generally so deficient as this is in such produce. The water around the coasts of this island is generally deep; and, as might be expected from the nature of the ground, abounds with fish, which the native, safe within the barrier of the surrounding rocks, can pursue with ease and success in the slightest canoe. The variation of the needle, as observed here and in the immediate vicinity, fluctuated chiefly between 9 and 10 degrees towards the east. The weather in those parts, during a course of three to four months that a register was kept of it, seems to have been variable, most frequently moderate. The winds in May, June, and July, were chiefly from easterly points; but in the subsequent month, they were more from the west. The mercury in the barometer stood commonly from 28 in. 1 line and 4-10ths to 28 in. 2 lines and 2-10ths. The heat was felt to be excessive, but the degree indicated in Reaumur's thermometer was never higher than 23° on shore, and 21° at sea. The tides were observed only once a day, when the water rose in perpendicular height from four to five feet.

The general aspect of the island of New Caledonia is mountainous and lofty. A chain of hills runs through the whole extent of the island, in the direction of its greatest length, consisting of three distinct rows or ridges, the breadth of which, taken together, is not less than 20 miles. These lines rise above one another somewhat in the form of an amphitheatre, varying in elevation from 2000 to 6000 feet above the level of the sea. A detached mountain rises above all the others, being upwards of 7000 feet in height. The principal component parts of these masses, are quartz, mica, stellite more or less hard, green schorl, granite, specular iron-ore, &c. Garnets are also found, likewise layers of gold, serpentine, hornblende, and tale. This island differs from all the others which have hitherto been discovered in the South Sea, by being entirely destitute of volcanic productions. The soil upon the sides of the hills is principally a yellow clay; but this being commonly but to a small depth, and very much interrupted by deep ravines, rocky protuberances, and other obstructions, they seem for the most part to be little capable of cultivation, even in their lower parts. Nearer to the summits, the farther impediment is of course added, of an untoward climate, extremely cold, and subject to violent and blasting winds. Commonly, however, they are throughout their whole extent coated with coarse grasses and other plants, and here and there trees and shrubs. Trees rising, in particular, from the bottoms of the gullies, by which the hills are every where furrowed, agreeably relieve the eye amidst the general aspect of barrenness, which otherwise prevails. Some of the mountains are even covered with trees to their very tops; and, in general, those elevated lands are the copious source of numerous streams, which, gliding in all directions, and with every variety of appearance over the face of the hills, at once beautify and gladden the entire landscape, and hasten to convey to the subjacent plains, health, fertility, and the means of improvement. The comparatively low-lying grounds, not only for the most part prevail over the whole extent of the sea-coast, but stretch, in particular directions, to a great distance between the hills. The common soil of these plains is a sandy black mould. The mode of recruiting the strength of this land, by the application of manures, seems to be unknown; but the slower means of melioration, which consists in allowing portions of it that have been exhausted to remain for a time in a fallow state, is universally practised, and the ashes obtained afterwards, in consequence of burning the grass, which had thus been suffered to over-run the surface, may so far have the same effects, which in other countries are aimed at by the introduction of such foreign substances. The cultivation, in general, is conducted here with industry, and at the same time with considerable skill. As is usual in China, and in the higher parts of Asia Minor, soil, which otherwise would not be sufficiently permanent to ensure a crop, is secured and supported by means of little walls built under it, and the fruitfulness of arid spots is increased by leading into them streams of water. The combination and contrast, which is found in as great perfection here as in many other parts, between the bold and striking features of nature and the softer traces of art, open a scene sufficiently picturesque; consisting, on one hand, of the grand and imposing objects, both in the island itself, and scattered over the coast, which have been already enumerated; on the other, of winding streams, agreeable plantations, and struggling villages.

The vegetable productions of New Caledonia seem, in general, to be the same which prevail commonly in similar latitudes. Small clusters of fig, cocoa, or other trees, usually surround the different hamlets; or even single houses, serving at once for ornament and shelter. In one or two instances, there were observed thick forests of cocoa trees; but, upon the whole, these seem to be rather scarce in the island. The same may be said of the plantain and bread-fruit trees, particularly of the latter; of which, notwithstanding the attention that seemed to be paid to them where they occurred, but few specimens were seen, and those apparently of an inferior quality. Bananas, Caribbee cabbages, and other plants of the arum tribe, mela- luca trees, aulurites, and various plants of the protea and bignonia families, are mentioned among the productions that were observed here, as also some species of hibiscus, acanthi, cassarina, and acrosticha. The commersonia echinata, a tree that is very frequent in the Muscaria, was noticed in the upper grounds. There is a species of hypoxis that grows here spontaneously. Sugar canes, sweet potatoes, and yams, also occur, together with a species of bean.
The inhabitants of New Caledonia are a race of people robust, well made, active, and of features and an expression of countenance rather agreeable. The common stature, both of men and women, especially of the former, is above what we usually distinguish as the middle size. There were some instances of persons not less than six feet four inches high. The prevalent colour is somewhat between a copper colour and a jet black. The beards of the men, and the hair in both sexes, is usually strong, coarse, and very much frizzled. The practice prevails of pulling out the beard by the roots, though in some cases also it is allowed to grow long. The hair is worn in many different ways, sometimes tied up to the crown of the head, sometimes clubbed at the sides, sometimes cropped short, and sometimes the appearance of long hair is acquired by means of two or three artificial tresses, made commonly with the leaves of some plant of the grass kind, and covered with the hair of the vamypre bat. A kind of combs is in general use, consisting of several sticks of hard wood joined together, of about the thickness of knitting needles, and from seven to ten inches in length. For the greater convenience, these are commonly worn in the hair. Both the hair and the beard are generally of a deep black colour.

The men of this island wear little or no clothing. A kind of garments made of coarse matting was observed among them, but these they seldom used. Their ordinary dress consisted merely of a piece of stuff manufactured from bark, or of the large leaf of a tree suspended from the neck, and wrapped round the middle of the body. The dress of the women is a short petticoat, or fringe, formed by putting together filaments of the plantain tree to the thickness of six or eight inches, and not much more in length, which are connected amongst themselves, and fastened about the waist by means of a long string. Both in this article of dress, and in other respects, a good deal of attention is paid to ornament. With this view, the skin is dyed or punctured, the ears are perforated, and much finery is brought into use, consisting of ear-rings, necklaces, amulets, bracelets made of shells, stones, or other precious or esteemed substances. A piece of dress which seems to be most valued among the men, is a kind of concave cylindrical black cap, made of strong paper, which was supposed to be reserved exclusively for the chiefs and warriors.

The houses or huts raised by this people are of a circular construction, somewhat in the form of a beehive. The framing is of small spars, reeds, or such like materials. The lower part of the huts is erected perpendicularly, to the height of three, four, or five feet, when the roof tapers off in a pretty regular cone, and is terminated by the upper end of a post fixed in the centre of the floor; the whole being covered, to the thickness of two or three inches, with a thatch made of coarse long grass. Some of these houses are surrounded by palisades, equal in height to their side-walls, and are decorated at top with carved work, or shells. The entrance into them is by an opening, which is commonly no more than sufficient to admit a person stooping. In the interior, more regard is had to convenience than to elegance, or even to neatness. The floors are laid with dry grass; and mats are spread for the principal people to sit or sleep on. Much use is made of fire in these houses, and the only outlet for the smoke is by the door; whence, being accustomed to an atmosphere at once gross and sultry, the inhabitants are extremely sensible to the cold of the open air.

The subsistence of the people of New Caledonia is chiefly derived from roots and fish; and almost their only household utensil is a sort of earthen jar, in which they prepare whatever part of their food is dressed by means of fire. This mode of living does not seem to indicate a very improved state of cultivation, even in those parts of the country which are in this respect farthest advanced. But as to the inhabitants of the mountains, they are obviously in a condition of the greatest misery, being without shelter from the severity of their climate, and in the utmost want of all manner of provisions. It is probably from necessity that some here have been led to eat a species of spiders which are found in the woods, nay, even to allay their hunger with a kind of earth called stafite. A certain enjoyment seems to be found by many in chewing the bark, or other parts, of particular plants. The common drink is water, which appears to be taken in a manner strangely uncouth and peculiar. The navigation of this people is less dextrous than that of several of the other islanders of the South Sea. The sort of canoes which they use seems to be peculiar to themselves, being a double canoe, formed by the junction, at the distance of about three feet asunder, of two distinct single ones. The mast is in the middle space betwixt both; and this clumsy and artificial vessel is carried forward by means of one or two latten sails, extended to a small latten yard. A kind of fishing nets was occasionally, though rarely, seen among the people of this island, made of the filaments of the plantain tree, or of some similar substance. Hooks and lines seem to be unknown among them. Their chief method of catching large fish was by striking them with darts, in which practice they were very dextrous. It is principally the women that take the shell fish, in quest of which they wade out a great way into
the sea, searching for them with pointed sticks, which they thrust into the sand.

The language that is spoken in New Caledonia is in some degree peculiar, but seems to be chiefly a compound formed from several of the languages prevalent in the different adjacent clusters of islands. A vocabulary of this language is annexed to the narrative of D'Entrecasteaux's voyage, published by Labillardière. From the circumstance of a name for iron occurring in their language, there appears reason to conclude, that the metal is not unknown to the inhabitants of this island. It has not, however, been observed to be in frequent use, even for purposes for which it might have been employed most beneficially, in the manufacture of warlike instruments for example, or of implements of labour. The common hatchets are made of serpentine stone; notwithstanding the hardness of which, they effect their objects with difficulty, and chiefly through the exertion of bodily strength. Yet did not implements of iron seem to be in much request here; less, indeed, than in any other of the South Sea islands.

The principal offensive weapons of the Caledonians are clubs, spears, darts, and slings, which they use with considerable art, and which are made commonly with much neatness, and even decorated often with a profusion of ornaments. The materials of which they are constructed are the same that are used for the like purposes in the neighbouring islands. There is a material difference in the accounts given by the navigators who have successively visited this island, relatively to the character and manners of the inhabitants. In the narrative which we have of Captain Cook's voyage, they are represented as a people courteous, friendly, honest, and generally of a mild and innocent disposition. In the account given by the French navigators, numerous instances are mentioned of their thievish inclinations, of their cunning, and the artful arrangements adopted by them, with a view to the accomplishment of their schemes of pilfering, and, in some cases, of their audacity and shamelessness in effecting such objects, or in maintaining and defending the acquisitions so obtained. From various examples adduced of the actual fact, as well as of several circumstances expressive of their inclination, and of the means employed to gratify it, nay, even from the exhibition of the instrument appropriated precisely to this object, there seems reason to conclude, that they have no disrelish for human flesh; though probably this appetite is not indulged, except with a view to an imaginary heightening of the revenge upon their enemies, which numerous appearances in different parts of the country proved them disposed to exercise with the most unsparing fury and devastation.

The territory of New Caledonia is divided apparently into many districts, each governed by its own chief. There is some intercourse of war or of peace between these different principalities, but there has been as yet no such union as to have ever led to the denomination of the whole island by a common name. The authority of the several chiefs over their people seems not to be very considerable, at least their orders were by no means strictly attended to in any thing that concerned the European visitors of the country. As it was observed, however, that more attention was paid to their commands in any thing that respected their own particular interests, the greater indifference in the other case, might perhaps be rather a new proof of artfulness of character than of any real insubordination. We have no adequate data whereby to ascertain the populousness of this island, though the reasonable presumption, even from the prevalent nature of the territory, is, that it cannot be very considerable.

Female chastity is here in reputation, and is guarded with some strictness, though, perhaps, not so inviolably maintained, as might be concluded from the representations on this subject of those who first visited the island. In other respects, women are in a subordinate and servile state. It is they chiefly who cultivate the ground; and they are employed in all other sorts of drudgery and manual labour. The Europeans who visited New Caledonia, had some opportunities of ascertaining the state of music in the island, both vocal and instrumental. The only musical instrument observed here, was one formed of a piece of polished brown wood, about two inches long, shaped somewhat like a bull, with two holes in it near the base, and one at top, all communicating with each other; and by blowing into the uppermost of which, a sort of shrill whistling sound was produced. In the singing that was heard, the performers seemed to have some idea of time and measure, but their voices were harsh and discordant, and the effect altogether to an European ear was rather disagreeable, though to the natives themselves it appeared to afford considerable pleasure.

Of the religion of the people of New Caledonia, nothing is known. They deposit their dead in the ground. The burial places are generally in the vicinity of their dwelling houses, consisting of small heaps of earth, raised a little, and covered towards the middle with a very open lattice work. Those in which their chiefs slain in battle are interred, are decorated with spears, darts, paddles, and such other insignia, emblematical either of a principal and important object of their lives, or of the manner of their death.

A sort of disease, somewhat of the nature of a leprosy, seems to be very prevalent in this island, the effects of which are exhibited in great swellings of the legs and arms, and a harsh, scale, and sometimes bloated appearance of the skin. Much also is suffered from the vast swarms of mosquitoes which hover everywhere round the coasts, and are extremely troublesome, both in the houses and in the fields.

See Cook's Second Voyage, chap. viii. ix. &c. and Labillardière's Account of a Voyage in search of La Perouse, vol. i. and ii. chap. vi. xiii. xiv. (k)

CALENDAR. See Chronology.

CALENDER, in the manufacture of cloth, in its limited sense, is the name of a mechanical engine used for smoothing the surface of cloth, after it has undergone the previous operations of warping, dyeing, and bleaching. In the more extensive and general acceptation of the word, among those who deal in cloth, a calender is a place where, besides smoothing the cloth, the operations of folding, papering, packing, and all others necessary to prepare it for exposure to sale, either in the home or foreign markets, are carried on.

For smoothing the superficies of cloth, two diffe-
rent modes are adopted: The first is merely that degree of compression which, besides distending the threads which compose the texture, frees the cloth from any creases or folds which it has previously received, and renders the whole surface on both sides uniform and level. The second, besides effecting this, adds a gloss to one side of the fabric; the first is generally called dressing; the second glazing. A considerable diversity of apparatus is required for these purposes; representations of the most important and essential parts of which will be found in Plate CVIII.

The most simple and common way of smoothing the surface of cloth, and which in some respects combines the two modes of acting upon it, namely, by pressure and by friction, is the common domestic smoothing iron, which acts both by pressure and friction. In the operation of the smoothing iron too, besides the mechanical operation, the effect is found to be much heightened by moderate heat, probably from the expansion produced in the stuff of which the cloth is composed, during the operation. For the smoothing of large surfaces of cloth, the operation of the hand-iron being too tedious, the implement generally employed for the use of private families, is the common mangle, of which there are different kinds in use. One very simple in construction, and which answers the purpose very well, is represented in Fig. 1. Plate CVIII. This machine consists merely of a strong level smooth table, of a convenient height and breadth, the cover being stout, and of well seasoned wood, to prevent casting or warping. The cloth being smoothly spread upon this table, the box A, which is placed upon two smoothly turned rollers of iron, is made to roll alternately from one end of the table to the other, until the cloth is sufficiently smoothed, when a fresh portion is spread upon the table, and the operation repeated until the whole piece has undergone the process. The cloth may be very regularly and quickly drawn along the table, by unwinding it from a roller at one end, and winding it upon a similar roller at the other. If it be desirable occasionally to employ heat, it may be easily done by casting the iron rollers of the box hollow, and filling the cavity with small cylinders of cast iron, heated previously in a furnace or common fire. The motion is communicated to the box A by two belts, cords, or chains B, B, which, after passing over a pulley at either end of the table, are wound round the cylinder or barrel C, By turning a handle or winch W, the barrel is moved round, and the motion communicated to the box in either direction. It will be found convenient to have two banks suspended over the box, by which it may be lifted from the table when the cloth is to be shifted.

An apparatus of this kind may do very well for family use, or upon a small scale; but it would be found too tripping and tedious for the operations of general business, where quantity and dispatch are necessary. For this reason, the common five bowl calender is generally used; and this machine is usually set in motion by the power of a horse, excepting in large manufactories, where the great moving powers, water or steam, are employed for a variety of purposes, in which case the calenders are driven by the same power employed for other mechanical purposes.

A front elevation of the five bowl calender will be found in Fig. 4. A is the frame-work, consisting of two very strong upright posts, generally of hard wood, about 12 inches by 6, and connected at the top by a strong cross piece or cape, fixed to the upright posts by screw-bolts, besides which there is usually another cross rail below, secured in the same manner. The bows or cylinders, five in number, are distinguished by numerals. Of these, numbers 2 and 4 are of cast iron, very smoothly turned, and hollow in the centre, for the purpose of admitting cylindrical pieces of iron red hot, when the calender is to be heated. The main bowl, or cylinder 3, used to be universally of wood, until the introduction of what are called paper bowls, which, we believe, originated in Lancashire, and which have been found in every respect so much superior to the former, that they are now in very general use, although the original expense of a paper bowl is at least six times as great as that of a wooden one. The advantage of the paper bowl over the wooden one, arises from its being perfectly free from every tendency to split or warp, to both of which the wooden one is very liable, especially when often exposed to great heat from the iron bowls with which it is in contact. Independent of this, which of itself is of infinite importance, the paper takes a very smooth fine polish when turned; and by pressing into every pore of the cloth, smooths its surface much more effectually than any cylinder of wood, however truly turned.

The construction of the paper bowls is simple although tedious, and may be very briefly explained. The axis of the cylinder is a square bar of malleable iron, of the proper length. Upon this is first put a cylinder of strong round plate of cast iron, of the diameter intended for the cylinder when finished. A quantity of thick stout pasteboard is then procured, and cut into round pieces, rather larger in the diameter than the iron plate. In the plates, and in every piece of the pasteboard, a square hole must be cut in the centre to receive the axis; and the circle being divided into four or five equal parts, a hole must also be cut at each of the divisions, an inch or two within the rim. These pieces of pasteboard being successively put upon the axis, a long rod of malleable iron, with a head at one end, and screwed at the other, is also introduced through each of the holes near the rim, and this is continued until a sufficient number are thus placed to form a cylinder of the length required, proper allowance being made for the compression which the pasteboard is afterwards to undergo. Another round plate is then put on, and being put upon the others, the whole are screwed tight, and a cylinder formed. The cylinder is now to be placed in a stove, exposed to a strong heat, and must be kept there for at least several days; and as the pasteboard shrinks by exposure to the heat, the screws must be frequently tightened until the whole mass has been compressed as much as possible. When the cylinder is thus brought to a sufficient degree of density, it is removed from the stove; and when allowed to cool, the expansion of the pasteboard forms a substance almost inconceivably dense and hard. Nothing now remains but to turn the cylinder, and this is an operation of no slight labour and patience. The motion in turning
The upper and lower bowls 1 and 5 are generally of iron or wood, and of the same diameter as 2 and 4. For the common smoothing operation of the calender, it is only necessary that these five cylinders should be made to revolve on their respective axes, the motion of each being in an inverse direction to that of those with which it is in motion, and the revolutions must be in the inverse ratio of the diameters, so that an equal portion of the circumference of each may be exposed to that with which it comes in contact. The motion is taken from the moving power by a belt passing over the pulleys at D, that next the cylinder being fast upon the axis of the main cylinder 3, and the other loose upon the axis. Thus, when the belt is upon the fast pulley, the calender will be in motion; and whenever it is shifted to the loose pulley, the calender will stop without interrupting the motion of any other machine acted upon by the same power. The large cylinder 3 being set in motion, the iron cylinders 2 and 4 receive their motion by means of the wheels C, C worked by the wheel B on the axis of the large cylinder. The cylinders 1 and 5 will revolve pretty accurately, merely by their friction upon the cylinders 2 and 4, or their motion may be rendered perfectly certain by other two wheels pitching into the wheels C, C. When a person stands in front of the calender, the cloth coming from belind, above the uppermost cylinder 1, passes between 1 and 2; passing behind 2, it again comes to the front between 2 and 3; between 3 and 4 it is again carried behind, and lastly brought in front between 4 and 5, where it is received, and smoothly folded on a clean board, or in a box, by a person placed there for the purpose. In folding the cloth at this time, care must be taken that it may be loosely done, so that no mark may appear until it be again folded in the precise length and form into which the piece is to be made up. The folding may be done either by two persons or by one, with the aid of two sharp polished spikes placed at a proper distance, to ascertain the length of the fold, and to make the whole equal. When folded into lengths, it is again folded across upon a smooth clean table, according to the shape intended, which varies according to the different kinds of goods, or of the particular market for which the goods are designed. In general, the obvious desire at every market is, to have the goods well smoothed and folded, so as to occupy the least possible bulk in packing. From this, however, a singular exception took place in a coarse kind of striped cotton stuffs, great quantities of which were carried out by the ships employed in the African slave trade. In that market, the estimation of a piece of those goods depended entirely upon its bulk when folded, and great care was therefore taken to have them done up very loosely, or what would in any other market have been termed as ill dressed as possible.

When the pieces have received the proper fold, the last operation previous to packing them, is the pressing. This is commonly performed by placing a certain number of pieces divided by thin smooth boards of wood in a common screw press, similar to those used by printers for taking out the impression left by the types in the printing press. Besides the wooden boards, a piece of glazed pasteboard is placed above and below every piece of cloth, that the oster folds may be as smooth and glossy as possible. The operation of the common screw press being found tedious and laborious, a very simple and efficacious method has been lately introduced of effecting the pressure by a column of water, which is so easy and expeditious, that the strength of a child is sufficient for the operation; and its power may be rendered much greater than what could be produced by almost any exertion of human force. These presses are used with great success in different extensive works; but as their discovery is recent, the application of the hydrostatical principle is also various. In Fig. 6, will be found a very simple mode of applying them to use, which it is hoped will sufficiently illustrate the general principle of their action, and may safely be adopted, with any judicious alteration which may render them more serviceable for the particular purpose in view. At present their novelty confines them to a few large works. The water press may be made as to the frame work, very similar to any other kind of press; but it is to be observed, that as the pressure is upwards, it must be very strongly secured to the floor upon which it stands, and which must be equal to the whole mechanical reaction, or be sufficiently strong to resist the whole force of the pressure. In the figure the frame work is distinguished by the letter A; the upper press board by G, and the under board by F. The board G is supposed to be fixed and immovable in the two upright posts; but it would be very convenient that it should be made to slide up and down as required, and it may be stopped above by blocks of wood, or any of the means by which the sole of the common screw press is usually made up to the height wanted. It may also be counterpoised with weights, for ease in the management. The lower press board F, must slide freely up and down, like the upper board of the common press. Under this board is the receiver B, for the water, which is here supposed to be a hollow tube of leather, or any other soft substance which can be rendered impervious to water, and which must be sufficiently strong to resist a very great pressure. Let the latter tube therefore be stretched upon very strong hoops of iron, at two or three inches distance from each other, and again hooped without, immediately above those in the inside. The hoops within will then keep the tube always distended, and those without will counteract the lateral pressure of the water within. To the bottom of this receiver is attached a tube, branching from the main tube B, for admitting the water into the receiver, and C, C are two stop cocks in the main tube, the right hand one for admitting, and the left hand one for discharging the water. The pressure of the column of water in the main pipe D, will then be in the direct ratio of the square of its altitude, and the pipe, according to the pressure required.
may be of any length. The goods to be pressed being placed between the press boards G and F, if the admitting cock be opened and the discharging cock shut, the under press board F will be forced up by the pressure of the whole weight of the column of water in the main pipe D; which, at 33 feet height, will give 15 lb pressure on every square inch. When the press is to be opened, it may be done in an instant by shutting the receiving and opening the discharging cock, which will discharge the water in the receiver into the drain at E. The simplicity of this press, and its immense power, render it one of the greatest improvements which have been lately applied to the practical purposes of manufacture, and where there is a command of water sufficiently elevated to fill the main pipe, it is wrought with no trouble or expense. Indeed, the waste of water is so very small, that the quantity may be easily collected from rain in a cistern, or may be sent up by means of a small forcing pump. A well bored iron-cylinder, with a close fitted piston, would be a safer and more durable receiver than the leather tube represented. But from the immense pressure, the piston would require much care in the packing.

For lawns and muslins of a light texture, the operation of smoothing requires a different process in some respects than close heavy fabric. They only require to be slightly smoothed, to remove any marks which they may have received at the beating; and as their beauty depends rather on their transparency than their closeness, the more the cylindrical form of the yarn is preserved the better. They are therefore put through a small machine, consisting of three rollers or cylinders; and as the power required to move this is small, the person who attends it generally drives it by a small wheel. It is represented by Fig. 7, A being the frame, B the winch or handle, and the rollers 1, 2, and 3. The mid roller 2 is of smoothly turned iron, the other two of wood. It is always wrought cold. Bouk and mull muslins, which are finished with starch at the bleachfield to give them a clear wiry appearance, receive no other finishing at the calender than folding and pressing.

In the thick fabrics of cloth, including both those kinds which are used for many parts of household furniture, and those for female dress, the operation of glazing is used both to add to the original beauty of the cloth, and to render it more impervious to dust or smoke. The glazing operation is performed entirely by the friction of any smooth substance upon the cloth; and to render the gloss brighter, a small quantity of bleached wood is previously rubbed over the surface. The operation of glazing by the common plan is very laborious, the apparatus being of the most simple kind. A representation of it is given in Figs. 2, and 3. A, is a table, with a thick stout cover of level and well-smoothed wood, forming an inclined plane; that side where the operator stands at work being the lowest, and is generally placed near a wall, as represented in the figure, both for convenience in suspending the glazing apparatus, and for the sake of light. A long piece of wood B, is suspended in a groove formed between two longitudinal beams D, D, placed parallel to the wall, and fixed to it. The groove resembles exactly the aperture between the sheers of a common turning lathe. The lever B, of which the groove may be supposed to be the centre or fulcrum, is faced at the bottom with a semicylindrical piece of finely polished flint C, which gives the friction to the cloth stretched upon the table below. Above the flint are two cross handles at B, of which the operator lays hold, and moves them backward and forward with his hands, keeping the flint pressing slightly upon the cloth. When he has glazed a portion equal to the breadth of the flint C, he moves his lever between the sheers DD, and glazes a fresh part; thus he proceeds from one side or selvage of the cloth to the other, and when all which is upon the table is sufficiently glazed, he draws it over, and exposes a new portion to the same operation. To preserve the cloth at a proper tension, it may be wound smoothly upon a roller or beam, which being placed to revolve upon its own axis, behind the table another roller to receive the cloth may be placed before both, being secured by a catch, acting in a ratchet wheel. Fig 2, a profile, and Fig 3, a front elevation, will serve sufficiently to illustrate this description.

To save a great part of the labour employed in glazing cloth, the common five bowl calender has been recently altered to fit this purpose, and upon some years trial has succeeded to the satisfaction of those who use it. It is still confined to the extensive calender works of the late Mr Miller of Glasgow, and was the invention of the superintendent of his works. A profile view of this machine will be found in Fig. 5. It consists of five bowls or cylinders, like the common calender, but instead of those bowls revolving with a velocity in the inverse ratio of their respective diameters, so as always to present an equal surface, and to act merely by their pressure against each other, the bowls or cylinders 2 and 4 move with greater velocity than the bowls 1, 3, and 5, and thus create or generate friction at three several parts of the operation. This difference is produced merely by the addition of a few wheels; and the difference between the common and glazing calender will be seen at a single glance, by comparing the wheel-work of Figs. 4, and 5. In Fig. 4, the motions of all the cylinders is in the inverse ratio of their diameters, so that each presents an equal surface. In Fig. 5, the motion, instead of being directly communicated from 3 to 2, as in Fig. 4, is given by the intervention of two additional wheels. The increase of motion depending entirely on the relative number of the teeth in the wheels B and C, on the axis of the cylinders 3 and 2 to each other (for the intermediate wheels E and F merely communicate the motion without affecting the velocity), 3 is made to revolve considerably quicker than in the common calender, and thus the necessary friction is created. To reduce the glazing to the common calender, it is only necessary to remove the wheels E and F entirely, and to substitute a larger wheel for the wheel B, which may be calculated to work directly into the wheel C. The profile view given in this figure affords an opportunity also of shewing the way in which the cloth is conducted from the table H over the roller I, through the calender, and received again at G. This is common.
to both calenders. A patent for Scotland was taken for the glazing calender; and upon a trial of some years, it has met with the entire approbation of those who have been in habits of having their goods glazed by it. As one machine, by being worked day and night, is capable of glazing nearly 1000 pieces of cloth of 28 yards each in a week, it is peculiarly adapted for the occasional hurry to which shippers are sometimes unavoidably subjected.

As a matter of accommodation, the different processes of packing, cording of boxes, sheeting of trunks, and in general all the arrangements preparatory to shipments, and also the intimations and surveys necessary for obtaining drawbacks, debentures, or bounties, according to the excise laws, are generally conducted at the calenders where goods are finished, and these operations sufficiently account for the general meaning attached to the word. (J. D.)

CALENDULA. A genus of plants of the class Syngenesia, and order Polygonia Necessaria. See Botany, p. 308.

CALIBER COMPASSES. See COMPASSES.

CALICO, a species of plain cotton cloth, the knowledge of which is derived from the Indian manufacture, and the name from Calicut, the district in India where they are chiefly manufactured. The first attempts to manufacture calicoes in Britain, were made in Lancashire, about the year 1772, and that manufacture is now prosecuted there to immense extent; chiefly for the use of the printers. Calico is merely plain or alternate woven cotton cloth, of an intermediate thickness, between those dense fabrics which are used for sheeting, and the more flimsy texture which is distinguished by the general appellation of muslin.

In the process of weaving, there is nothing curious to analyze; for it is so very easy, as to be among the first essays which an apprentice is required to make, in order to acquire some knowledge of the first principles of the art which he may be afterwards called to exercise in the most difficult and complicated of its numerous branches. As an article of general consumption, however, calico is an object of immense consideration to those manufacturers and merchants who produce and circulate printed goods for general consumption. Of all the cloths which are printed or stained by chemical and mechanical means, calicoes, from their cheapness, form by very far the largest proportion. Hence, if less objects of technical investigation, they are infinitely more so of mercantile and economical speculation. It is, therefore, to this particular branch of weaving, that the attempts (for hitherto they can be called little more) to weave by the application of mechanical power, have in almost every instance been directed: for what it technically termed shawl cloths, are merely calicoes of a different breadth and fineness.

The adaptation of yarn to the reed in the calico manufacture, may be very easily fixed; for, in general, there is but one universal standard, at least in Scotland. This is an 840 reed; or, as it is generally termed, an eight and two porter. Hence, in the Scottish phraseology, the term calico is seldom used; blanket is more common, but this properly signifies the application of cotton wool to linen warp. Among operative weavers, an aught and trea generally expresses the meaning without any addition. It may appear singular that 840 intervals of a reed should become an almost universal standard, whilst 850 forms the exact division by hundreds, which is the usual mode of counting; and its universal adoption forms a curious specimen of the means of economy fashionable at the time when it was adopted. The manufacture being then upon a much less extensive scale than it is now, and conducted with much less attention to regular method, the reeds were often constructed by porters of 29 splits each, and counted by them. But the regular manufacturers finding this practice (which subsisted chiefly among the customer weavers, as they were termed, who were employed to weave up home-spun yarn by industrious housewives) to be very inconvenient in extensive practice, and of little practical utility, abandoned it in toto, and contented themselves with dividing the hundred into two equal parts. Upon this division their scale of prices was regulated, rejecting all intermediate divisions. But as the manufacture of calico appeared likely to become extensive, and also to require the most scrupulous parsimony, by deducting ten splits from the fifty which formed the half hundred, they virtually reduced the price of weaving, while the difference neither violated their established usage, nor created discontent.

Cotton yarn, about No. 24 or 26 of the water or engine twist, is generally used for the warp, and they regulate the appearance of the cloth so as to appear either opener or denser in the fabric, by the fineness and quantity of wool which they use. As they wish to give every possible appearance of density to the fabric, the slack twined yarn spun by the common hand-jenny is used for this purpose.

In all the lighter kinds of cotton manufacture, in order to smooth any projecting fibres of the woof, it is generally woven in a wet state, which in some respects answers the same end as the musillage used for dressing the warps; but in the calico, and most of the denser fabrics, it is woven perfectly dry, in order that it may appear asoozyaspossible. (J. D.)

CALICUT, or more properly Colombo, the name of a kingdom of India on the coast of Malabar, which now forms a part of the possessions of the East India Company. When Cheruman Pernal resolved to end his days at Mecca, he divided the country of Malabar among his nobles; but having nothing left to bestow on the ancestor of the Tamuri, he gave that chief his sword, and all the territory in which the crowing of a cock could be heard from a small temple. This territory formed the original dominions of the Tamuri, and was called Colicoud or cock crowing. The country was possessed by the Tamuri Rajas till the Mussulman invasion. It was taken from Tippoo by the East India Company, in whose possession it still remains. A full account of the statistics and commerce of this part of India will be given under the article Malabar, from very recent and authentic sources of information. See the following article. (u)

CALICUT, or Calicoud, the capital of the ancient kingdom of the same name, situated on the coast of Malabar. This town, which is chiefly inhabited by Moplays, is about three leagues in circumference, including an extensive suburb, principally inhabited by fishermen. Calicut consists partly of houses
built of teak wood, or of bricks baked in the sun, and partly of huts composed of palm branches interwoven through each other, and covered with palm leaves, and beautiful gardens appear in every part of the town. The bazar was reckoned one of the finest in Malabar, and contained four or five fine streets. There are very few stone buildings, and the fortress is of much greater antiquity than the city. The natives suppose it to have been built by Cheruman Permal.

Mr Torin, the commercial resident at Calicut, has been endeavouring (December 26-30th, 1800) to establish a manufacture of the plain cotton goods called long cloths. It is of six callo fineness, or which is the same thing, its warp contains 744 threads, and the length of the pieces is 72 cubits, and their width 24. The price of each piece is, according to its quality, from 30s. 32. to 54 gold fanams, or in our money 16s. 4½d. 17s. 5½d. 18s. 6¾d. When this cloth is bleached, it is sent to Europe on the Company's account. In this manufacture fewer than 257 hands are employed. These are chiefly 34 men, and produce monthly 468 pieces of cloth. The weavers, who are indolent and dishonest, were brought from the dominions of Travancore and Cochi. "Some men of the Panchala tribe," says Dr Francis Buchanan, "which here is called Peringullan, paint and varnish wood by the following process. They take butter milk, and boil it with a small quantity of quick lime, until strings form in the accretion, and separate from the watery parts, which they decant. The stringy matter is then mixed with the paint, which has been well powdered. With these the wooden work is first painted; it is then allowed to dry for one day; and afterwards receives a coat of pendum, which is the fresh juice of a tree called peini matram. The pendum must be used while it is fresh, and will not keep for more than two or three days. After the first coat of pendum has dried, another coat of paint is given, and that is followed by another of varnish. In the same manner leather may be painted and varnished. The varnish effectually resists the action of water. All my attempts, however, to find out the varnish tree were vain."

Calicut and Vuyyura form a small district; and unfortunately I have received no answers to the statistical queries which I proposed relative to it. From Mr Sme's valuable communications, I am persuaded, that, from the southern and middle divisions of Malabar, at least the following quantity of the produce of plantations is annually exported:

<table>

Besides large quantities of ginger and turmeric, and I have already mentioned, that the quantity of black pepper is more than double that here stated."

The tree which is intended to be cut down is first deprived of its branches; the trunk itself is then cut nearly two thirds through, and long incisions made in the bark. In this state it is left to dry for one year, during which the bark drops off. The tree is then pushed into the river Beypour by elephants, during the rains, and is floated down to within a little distance of Calicut.

The coast, which is low, and devoid of shelter, is accessible only by small flat-bottomed boats. A small cape or promontory projects into the sea; and though there is a good roadstead about three leagues from the shore, yet, when the wind blows from the sea, the slipping is exposed to considerable damage. The harbour is much more capacious than it was formerly, as a great part of it has been filled up with sand by the sea. The trade of Calicut is consequently in a languishing condition; but there is reason to hope that the Mahometan Arabs will take some means for removing the evil.

When the Moors began to establish themselves in India, during the 8th century, Cheruman Permal, the sovereign of Malabar, not only embraced their religion, but resolved to end his days at the holy city of Mecca. Calicut, from which he departed, was thus endeared to the Moors; and, in spite of the inconvenience and danger of its port, it became the mart of their commerce. Precious stones, pearls, amber, ivory, porcelain, gold, silver, silk and cotton stuffs, indigo, sugars, spices, precious woods, aromatics, and fine varnish, were brought to Calicut from every part of the East, both in ships and by land-carriage on the backs of elephants.

When Vasco de Gama touched at the city of Melinda, he was astonished at the information he received respecting the commerce of Calicut; and, with the assistance of a skilful pilot, he stretched across the Indian ocean, and reached Calicut on the 22d of May 1498. Here he accidentally met with a Moor of Tunis, called Menzeide, who understood the Portuguese language, and who had admired the enticing deeds of the Portuguese, which he had witnessed on the coast of Barbary. This Moor obtained an audience of the Samorin for Gama, who proposed an alliance and a treaty of commerce with the King of Portugal. Before the treaty was concluded, the Mussulmans succeeded in throwing suspicion on the views of Gama; and the Samorin dreading the effects which might result from such a connection, formed the resolution of cutting off Gama and his followers. The Samorin, however, had not the courage to execute his purpose; and he permitted the admiral to return to his ship. In consequence of making some reprisals, Gama compelled the Samorin to give him hostages, and to restore to him the merchandise which he had left in Calicut; and he returned to Portugal loaded with the rich spoils of the East.

Some time afterwards, thirteen Portuguese vessels, under the orders of Alvarez Cabral, arrived before Calicut, and brought back to the Samorin some of his subjects who had been carried off by Gama. These Indians spoke highly of the treatment they had received from the Portuguese, and induced the Samorin to treat them as friendly allies. The jealousy of the Moors, however, was again roused, and the people of Calicut, seduced by their
schemes, massacred fifty of the Portuguese. Cabral, however, soon revenged their barbarous treatment. He burned all the Arabian vessels that were in the harbour, battered the city, and repaired to Cochin and Cananore. The kings of these two cities gave him spices, gold, and silver, and proposed to enter into an alliance with him against the Samorin, to whom they were tributary. The kings of Oner and Coulan, and several other princes, joined in this proposal, with the hopes of freeing themselves from their tribute, and drawing to their harbours a portion of the commerce of Asia. Blinded by these views, the infatuated sovereigns of the East surrendered themselves, in a great measure, into the hands of the Portuguese. In every part of Malabar, the Portuguese obtained such influence, that they built a fort in every city, and compelled every sovereign to acknowledge himself a vassal of the court of Lisbon. The other nations of Europe, imitating the adventurous spirit of the Portuguese, sent out vessels to bring home the merchandise of the East; and such was the contempt and obscurity into which the Portuguese had fallen, that scarcely one of their ships was to be seen in the ports of the Samorin, where the English, Dutch, French, and Danes, had considerable factories. The Dutch established themselves here in 1604; the English followed them soon after; but the French did not establish their trade till about sixty years after the Dutch.

When Malabar fell into the hands of Tippoo, in 1789, he destroyed Calicut, and removed the inhabitants to Nelluru, the name of which he changed to Furruckabad. He razed the city to the ground, destroyed its trade, banished the merchants and factors of the foreign commercial houses. He cut down all the cocoa-nut and sandal trees, and ordered the pepper plants in the surrounding district to be torn up by the roots, and cut to pieces. His cruelty to the inhabitants of Calicut, was marked by the most dreadful barbarity. Great numbers of them, both male and female, were put to death. The mothers were first tied up, and then the children suspended from their necks. Several Christians and heathens, were brought out naked, and tied to the feet of elephants, which dragged them about, till they were torn limb from limb. All the churches and temples were burned or pulled down. Christian and Pagan women were compelled to marry Mahometans, and Mahometan women to marry heathens and Christians. The Pagans were deprived of the token of their nobility, which is a lock of hair named cudunti, and every Christian who was seen on the streets was either circumcision, or hanged on the spot. About fifteen months after the inhabitants were removed to Furruckabad, the province was conquered by the English; and the inhabitants returned with transport to their old place of residence. Before the town was destroyed by Tippoo, it contained about six or seven thousand houses. It now contains about five thousand houses, and is rapidly recovering its importance. The inhabitants are principally Moypals, a stout and industrious, but villainous race of men, who settled in this country about 400 years ago, and are nearly as numerous as the Nairs, whose authority over them they dispute. East Long. 75° 52', North Lat. 11° 12'.

See Nouvelle Relation d'un Voyage fait aux Indes, Vol. V. Part I.
The language of the Rumsen is proportioned to the feeble development of their understandings. They have few words to express abstract ideas, or even to distinguish the several species of animals or vegetables. Their moral epithets are, in general, borrowed from the sense of taste, the gratification of which is their greatest delight; so missisch signifies both a good man, and savoury food; and keches a wicked man, and tainted meat. The Escealen, however, have a richer idiom; and what is particularly curious, it has a greater resemblance to the languages of Europe than to those of America. The labials, of which the American languages are in general deficient, are used by the Escealen, particularly the letter F, which is pronounced by them in the same way as by Europeans. If we should be inclined to conclude from this, that the Escealen are strangers to this part of America, "it must at least be admitted," says La Perouse, "that they have been inhabitants of it for a long time past; for, in colour, features, and in general all the exterior forms, they differ nothing from the other people of this country." To shew the extreme difficulty of giving exact vocabularies of savage languages, and the impossibility of acquiring any adequate knowledge of them from the representation of travellers, we shall present to the curiosity of our readers, the numerical terms of the Rumsen and Escealen, as given by Humboldt and La Perouse.

It has been attempted by some travellers to establish a resemblance between the Mexican or Aztec language, and the idioms of the northwest coast of America; but they have completely failed. These languages differ in the most essential points, and even in their numerical words it is impossible to trace the smallest similarity. The Californians are totally unacquainted with the use of written characters. They have neither the symbols and hieroglyphics of the Mexicans, nor the letters of the most eastern nations of Asia; and by this means the origin of their nation is involved in equal obscurity with the origin of their language. If they ever possessed any invention to perpetuate their history, they have now entirely lost it. They are even destitute of every method of distinguishing the years, or the intervals of time, as the Mexicans did by means of their cycles of fifty years; and all that can be found among them, consists merely in some obscure oral traditions, probably more and more adulterated by a long succession of time. According to these traditions, their ancestors, being driven from their native settlements in the north, removed down to California, which they say was owing to a quarrel between two great men, who divided the nation into two opposite factions, and, after a bloody battle, the side which was defeated flew towards the south, and being eagerly pursued, was compelled to seek for safety among the mountains and islands of the sea. This is all the information which the Spanish missionaries have ever been able to procure concerning the origin of this people; and though the most probable conjecture is, that they, as well as all the other nations of America, have passed over from Asia since the dispersion of the nations, yet it must be admitted, that not one single monument has ever been discovered throughout the whole of the American continent, to authenticate clearly their Asiatic origin.

The Californians are of a more tanned and swarthy complexion than the other Indians of New Spain; but their faces are far from being disagreeable, and they are in general robust, vigorous, and of a healthy countenance. They seem, however, of all the American savages, to be nearest to a state of nature. "Their characteristics," says Father Venegas, "are stupidity and insensibility; want of knowledge and reflection; inconstancy, impetuosity, and blindness of appetite; an excessive avarice, and abhorrence of all labour and fatigue; an incessant love of pleasure and amusement of every kind, however trifling or brutal; pusillanimity and relucity; and, in fine, a most wretched want of every thing which constitutes the real man, and renders him rational, inventive, tractable, and useful to himself and society; for even in the least frequented corners of the globe, there is not a nation so stupid, of such contracted ideas, and so weak in mind, as the unhappy Californians." Their utmost desire is to get the present day's food with as little fatigue as possible; and unless stimulated by hunger, they will remain whole days stretched out on the warm sand. Their life passes away in a perpetual languor and detestation of labour, except when roused to mix in the diversions of dancing or gaming, for which they seem to have a most inordinate passion. Some spirit of emulation, however, has been discovered among them; and they have sometimes been
California. 251

excited to exertion by seeing their companions praised and rewarded. But it is only upon such occasions that they can be prevailed upon to shake off their inherent sloth. The quality which is chiefly valued among these savages is bravery, though they seem to be altogether ignorant of its true nature, and even destitute of mere animal courage. Their anger is excited by the slightest causes, but as easily appeased, and lasts no longer than while they meet with no resistance. They are daunted by the least opposition, and when once overcome with fear they will submit to the lowest indignities. But if, on the contrary, they have obtained any advantage, and their enemy appears disheartened, they will prosecute their malice, and exult over them with the most childish extravagance. It must be observed, however, that their rage is in general reserved for the enemies of their tribe. The greatest harmony prevails throughout the horde. Quarrels are scarcely known among them; and though they may be destitute of those nobler qualities for which some savage nations have been distinguished, they are also free from many of their vices. They are neither obstinate, harsh, nor cruel, but extremely docile and gentle, and easily persuaded to either good or evil. Inebriating liquors were unknown in the country; but they intoxicate themselves with the fumes of wild tobacco, which, however, is confined entirely to their festivals.

Among the Californians, every nation or language consists of several rancherias, more or less extensive, according to the fertility of the soil, and the rancheria of one or more families. They have no chiefs or caciques among them, whose authority they acknowledge either by tribute or external ceremonies. The Californian savage in all his actions is free and unrestrained. He is entirely master of his liberty, and knows no superior to whom he must give an account. Every family governs itself according to its own fancy; and the natural obedience of children to their parents, is forgotten as soon as the former are able to provide for themselves. On some occasions, however, they submitted to the direction of a leader, especially in gathering, at particular seasons, the fruit of the pilabaya, which constituted their principal food, in their fisheries, and in their military expeditions. But this dignity was obtained neither by blood, nor by age, nor by a formal election. He that was most brave, artful, or eloquent, assumed the command, and his authority was established by the tacit consent of his rancheria, who quietly submitted until the exigency was over which required his direction. In the time of war, this leader sent and received the messages to and from the adjacent friendly states; spirited his nation up to revenge; informed them of dangers, and headed them in battle. But their warlike expeditions were never undertaken, like many savage nations, for the sake of plunder, or to increase their territories, but generally to revenge some affront or injury among private persons, as the honour of the whole rancheria was supposed to be affected by an insult offered to any of its members. A more substantial, though not such a common cause of quarrel, was when one nation presumed to hunt, fish, or gather fruits, where another nation had acquired a prescriptive right. The offence was immediately followed by a declara-

ration of war. Hostilities were commenced, and if the aggrieved party supposed themselves unable to give battle to their enemies, they applied for succour to some friendly rancheria. Preparations are then made as openly, and with as much noise and bustle as possible, in order to strike terror into their adversaries, and by this means obtain an easier victory. Every one was commanded to provide a sufficient quantity of arrows, which were made of reeds, curiously pointed with flint, but not poisoned; at least, if they used any substance for this purpose, it was very slow in its operations, for the Spaniards have never been able to discover such a custom, nor have met with any instances of slight wounds occasioned by these arrows proving fatal. They have also a kind of wooden spears, with the points sharpened and hardened in the fire, which they use when they came to close action, and which do equal execution with those pointed with steel. They advance to the attack with a loud shout, and engage without any regularity; and the battle is decided, not so much by conduct, strength, or courage, but by keeping up their spirits against their innate cowardice, and by shewing an apparent boldness, in order to inspire their enemy with fear. The Californians do not, like many American nations, eat their prisoners, or enemies killed in war, although, when they have slain a chief or leader of the enemy, they eat a small morsel of his body in the field of battle, being impressed with the idea, that it increases their courage. They burn their dead, and deposit the ashes in a morat; and, like the Canadians, they scalp the vanquished, and tear out their eyes, which they have the art of preserving from corruption. In some of their battles, immense numbers are slain on both sides; and many of the rancherias, in the south of the peninsula, have been totally destroyed by these intestine quarrels.

The ancient religion of this people, as far as can be collected from the accounts of the Jesuits, is a mixture of the most monstrous absurdities, of which it is impossible to give any adequate description. Indeed, these accounts vary so much, in many most essential particulars, that we are not disposed to place much reliance upon their accuracy. Father Venegas prefaces his account of the Californian religion, by telling us, that all relations agree, that idolatry was unknown in this country; that the inhabitants had neither creature nor image, to whom they paid any kind of adoration; nor any outward profession of religion, either in festivals, prayers, vows, expiations, or any public or private marks of addresses to God; and that they were involved in the same deplorable blindness as their neighbours, on the opposite coast of Cinaloa, of whom Father Rivas says, that scarcely any trace of religion was to be found among them, nor did their external performances shew the least knowledge of God. But we are at the same time told, that they had among them a series of speculative tenets, resembling many of the Christian doctrines, though mixed with a thousand absurdities; an order of priests; and schools where their youth were instructed in religious opinions. That they had an idea of the true nature of God, of the eternal generation of the logos, of the doctrine of the Trinity,
and of the fallen angels which induced the missionaries to believe, that they must have been visited by some Christians, whose opinions they had imbibed, and had incorporated them with their own absurd notions. Each of the three nations, however, into which the Californian peninsula is divided, differs from the rest very materially in their religious ideas; and Father Venegas has furnished us with a very circumstantial account of these distinctions; but we have neither room nor inclination to follow his recital, and shall content ourselves with merely observing, that the Californians worship three divinities, who are supposed to carry on a war of extermination against each other: Sumongo, or the spirit of spirits, who lives in the north part of heaven, and punishes his people, by sending sickness and pestilence upon the earth; Niparaya, the creator of the world, who delights in peace; and Wac Tiparan, the evil spirit, who rebelled against Niparaya, and was cast down from heaven; each of whom have their particular worshippers.

The edues or priests, who are called dicuinochos by the Menquies, and those who inhabit the middle part of California, and vannas or guasmas by the Cochimies, pretend that they carry on a friendly intercourse with their deities; and are possessed of knowledge and power sufficient to prevent any calamity, or to give success to any enterprise. They have thus acquired such an absolute ascendancy over the minds of this stupid and ignorant people, that they demanded as their right, the best of the fruits, and the choicest of the game, which had been procured either by fishing or hunting. If these were denied, or sparingly bestowed, they were threatened with sickness, disaster, and failure of harvests; but if given liberally, they were fed with magnificent hopes of abundance, and the most desirable enjoyments. But the authority of the Californian priests appeared most conspicuous at their public feasts, celebrated by a whole nation, or by a single rancheria as a family. They then appeared in their habits of ceremony, which were only used upon extraordinary occasions, and which consisted of a large cloak, entirely composed of human hair, a high plume of hawk's feathers upon their head, and a monstrous fan of the same materials in their hand. Those of the Cochimies had, besides, a string of deer's hoofs round their neck, and another round their middle as a girdle. Thus accoutred, they opened the entertainment with sucking the chaeuaco, till they became intoxicated, and almost frantic with the smoke; they then began an oration upon their tenets, which was delivered with the wildest gestures, and most frightful vociferations.

Upon such occasions they exercised the most wanton authority. According to their private passions, they celebrated some as brave and generous; and upbraided others as cowards, factious, and wicked, who were commanded to make expiation, by undergoing certain penances. Sometimes a single individual, sometimes a whole rancheria came under the sentence. In some cases, they were prohibited for a given time from tasting a certain fruit, fish, or beast; or enjoined to clear ways along the tops of the mountains, for the more easy descent of the visitating spirit, and to lay a heap of stones at certain distances, where it might stop and rest itself; and to such a length did they carry their influence, that they even sometimes ordered them to throw themselves from a precipice, and such was the blindness and dread of this people, that their orders were seldom disobeyed. The festival consisted chiefly in eating, drinking, dancing, talking, or laughing; and was considered as a religious solemnity, merely from the presence of the priests; and after being inflicted by glutony and intemperance, the whole concluded with the most lascivious abominations. To these public feasts the neighbouring and friendly rancherias were usually invited, to whom they likewise sent challenges for wrestling, leaping, running, shooting with the bow, and trials of strength. They were sometimes held without any necessary motive; but, in general, they were made at the annual solemnity of burning the ears and nostrils of the children, for receiving the ornaments of pearls, which were common to both sexes; at the gathering of the pitayas; for a victory; for the division of the capture of fish; and for distributing the deer skins to the women, which constituted their principal clothing. In some of the islands, however, particularly those on the western coast called De los Dolores, both the religion and customs of the inhabitants were very different from those of the peninsula. Every community had its civil and spiritual officer; and according to Father Torquemada, they had temples, images, sacrifices, and sacred birds.

The Californians throughout the whole of the peninsula were uniformly destitute of any kind of clothing, and the only distinction among the natives in this respect was the form and nature of their ornaments. The Pericues braided their hair with strings of pearls, interwoven with small feathers. The Menquis wore a closely braided girdle round their waist, and on the forehead a curious filament of network, made of piña thread, and they also adorned their arms with bracelets made of nacar, a small round fruit like beads. The Cochimies, who usually kept their hair short, had a kind of diadem or crown formed of several bands of nacar, and sometimes of small white round naut shells, resembling pearls. Like several tribes of the Orinoco, these savages entertain a great horror for clothing. "A monkey dressed like an officer," says Father Venegas, "does not appear so ridiculous to us, as a man in clothes does to the Indians of California." They look upon it as effeminate and disgraceful. They were highly afforded when desired to cover themselves; and when offered clothes by the missionaries, they either refused them, or afterwards threw them away. The women, however, paid more attention to decency, and even the infants of the female sex were not without a proper covering. Some had garments manufactured from the leaves of a certain species of palm tree, which being beat, assumes the appearance of rough flaxen threads, but which, instead of being woven were merely fastened to one another at the top, and hung down in very close and thick skains and tufts. Of these they formed a petticoat, which reached to the feet; and also a short cloak which they threw over their shoulders. Others formed their petticoats
of thin pieces of sedge fastened together with mes-
cul threads, and covered their bodies with skins of deer,
sea wolves, hares, foxes, and other beasts. They
all bedaubed their faces with ointment, and painted
their skin by way of ornament.

The Californians being a wandering people, remov-
ing from place to place in quest of subsistence, their
habitations were suited to their mode of life. They
cost them very little trouble in the construction; and,
when overrun with vermin, as was sometimes the case,
set fire to them, and then rebuilt them in an
hour or two. Some of them were composed of a few
stakes fixed in the ground, which were drawn to-
ether at the top, and covered with bark or sedge;
the entrance was low and narrow; the fire was placed
in the centre, and the smoke escaped through a hole in
the top. They lay down on skins spread round the
fire, and slept indiscriminately, without distinction
of age or sex. Others consisted merely of a little space
inclosed with stones heaped upon one another, half
a yard high, without any covering but the heavens,
and so constructed that they had not room to stretch
themselves at full length. The whole
of their furniture consisted of a bow and arrows, a wood-
en spear, a bowl made in the shape of a high crown-
ed hat, a batea or jug, a bone which served them for
an awl, a little piece of touchwood for kindling a
fire, and pita nets for fishing, for gathering fruits,
and for carrying their children. These nets shewed
very great skill, and were made of so many different
colours, and such exquisite workmanship, that Fa-
ther Taraval affirms, " of all the nets I ever saw in
Europe and New Spain, none were comparable to
these, either in whiteness, the mixture of the other
colours, or the strength and workmanship, in which
they represent a vast variety of figures." This fur-
niture was carried by the women when they removed
from one place to another; the men had only their war-
like weapons, with their appurtenances, as flints and
feathers for their arrows, and strings for their bows.

Polygamy, though admitted and practised among
the Californians, was not general, but appeared to be
confined chiefly to the southern districts. Among
some of the nations their marriages were negotiated
by the bridgroom presenting the bride with a batea
or jug made of mescal thread; her acceptance de-
toned her consent, which she communicated by re-
turning a net for the head. Among others, the
agreement was concluded at the end of a feast, given
by the lover to the whole rancheria. Their mar-
rriages, however, lasted only during the pleasure of
the parties, and were annulled by the slightest mo-
tive. They attached very little importance to the
exclusive possession of their women, as they often
staked their favours as prizes at their games; and so
weak is natural affection among this people, that
mothers have been known frequently to destroy their
children in any scarcity of food.

The disorders to which the Californians were sub-
ject, arose chiefly from intemperance in their pleasures,
and the vicissitudes of the climate. In winter, they were
exposed to sore throats, pleurisy, and catarrhal affec-
tions; and to putrid, bilious, and inflammatory fevers
in the summer. They were also liable to dysentery, oph-
thalmia, and to itch, and other cutaneous affections.

But, though their diseases were both numerous and va-
rious, the method of cure was nearly the same in all;
which consisted in the use of a few plants, fumes of wild
tobacco, cold bathing, and stoving, or the warm air-
bath. Their only physicians were the priests, who en-
deavoured to inspire confidence in their remedies, by a
pretended intercourse with invisible spirits; and their
cures were always administered with great ostenta-
tion and solemnity. The most remarkable was the
application of the chacuaco, a tube formed out of a
hard black stone. This tube being filled with ei-
marron, or wild tobacco, and applied to the affected
part, the smoke was either sucked in, or blown
down, according to the physician's direction. "This
powerful caustic," says Venegas, "sometimes with-
out any other remedy, has been known entirely to
remove the disorder." But, when all remedies pro-
ved ineffectual, when herbs, juices, baths, and the
chacuaco had been tried in vain, the patient's rela-
tions were assembled around him, that he might die
in their presence; and if he had a daughter or sister,
the physician cut off the little finger of her right
hand, pretending that the blood would either save
the patient, or at least remove from the family all
sorrow for his death. He was no sooner supposed
dead, than they immediately proceeded to bury or
burn him, with all his utensils, which was done amidst
the continued outcries and howlings of the specta-
tors.

In this account of the manners and religion of the
Californians, we have confined ourselves entirely to
their savage state, before the knowledge of Chris-
tianity was introduced among them by the Jesuits,
and their country annexed to the Spanish dominions
in America. The independent tribes still retain the
same habitation, the same dresses, and the same
amusements; but since the establishment of the Spa-
nish missions in California, their savage manners
have been greatly softened, many of their religious
ceremonies abolished, and civilization and agriculture
have rapidly increased. In these missions, the col-
our and industry of the Indians, the house of the
monks, the magazines built of bricks, the threshing
floor, the cattle, the horses, all present the appear-
ance of a plantation in any of the West India colo-
nies. But, before we proceed to a description of their
present state, we deem it proper to give a brief
account of the discovery of the country, and of its
establishment by the Spaniards.

We have already observed, that California was first
discovered in 1534, by Hernando de Grijalva, in
a voyage undertaken by the order, and at the particu-
tlar expense of the famous Hernan Cortez, who had
fitted out several small squadrons for the purpose of
prosecuting his discoveries in the South Sea. Dis-
contented with the tediousness and unsuccessfulness
of these discoveries, Cortez embarked in person, in
1536, with 400 Spaniards and 900 negro slaves, and
landed in the eastern coast of California, in the bay
of Santa Cruz, now called the Port de la Paz. Hav-
ing coasted both sides of the gulf, with great diffi-
culty and danger, he returned to Santa Cruz, with
the loss of many of his companions, who had died of
famine and fatigue. Urgent affairs, however, demand-
ing his presence in Mexico, he committed the command
of the squadron to Francisco de Ulloa, who, in the
course of two years, ascertained the coasts of the
gulf of California, then known by the name of the
Sea of Cortez, to near the mouth of the Rio Colo-
rado. But the first European settlement which was
attempted in this peninsula, was by order of Philip
II. of Spain, in 1596, who appointed Sebastian Vis-
caino to the command of an expedition fitted out for
that purpose. The Spaniards landed in the Bay de
la Paz, and, finding the Indians of a peaceable and
friendly disposition, established a garrison within a
pallisade; and erected a small church and some huts
with branches of trees, as the capital of their conquest.
The natives brought them fruit, fish, and also some
pearls; but this friendly intercourse did not long con-
tinue, for they were irritated and provoked by the
excesses and outrages committed by the Spanish sol-
diers, who, both here and in other parts of the coast
which they went to visit, had drawn upon them the
hatred of the inhabitants. Being distressed for want
of provisions, and soon perceiving that the soil was
unable to produce sufficient food for such a number
of men, General Viscaino determined to abandon the
conquest, without leaving any settlers in the country;
and returned to New Spin at the end of the same
year. About six years after, Viscaino was again ap-
pointed to explore the north-west coast of Califor-
mania, in order, if possible, to discover some convenient
harbour that might afford an asylum to the galleons
on their return from Manila. In this expedition,
which was attended with much danger and distress,
he fell in with a very commodious and spacious har-
bour in 32 degrees of north latitude, which he called
San Diego; and also another in 36° 40', which he
named Monterey, and which has since become the
principal settlement of the Spaniards in this country.
He describes the country as covered with trees, the
climate mild, the soil fruitful and well peopled,
and the natives kind and tractable. From that time Cal-
ifornia was frequently visited by private adventurers,
for the sake of the pearls which were found upon its
coast, which they either fished, or purchased from
the Indians; and it is to the rapacity of these persons,
and the many acts of cruelty and injustice which they
committed against this people, that we are in a great
measure to attribute the failure of the many expedi-
tions which were afterwards undertaken for the re-
duction and colonizing of this country. Spain, being
at last tired of making such fruitless attempts, and
irritated at the loss and expense which had been oc-
casioned by these expeditions, had entirely renounced
the conquest of California, when the Jesuits, in 1697,
requested permission to undertake the conversion of
its inhabitants. Father Salva Tierra entered upon this
enterprise with only six soldiers and three In-
dians; and having landed in the bay of San Diony-
sio, on the 19th of October, founded the presidio of
Loretto, which is now the principal place of all the
missions of Old California. They were at first re-
ceived with great joy and affection by the Indians of
the neighbouring rancherias, to whom they distribu-
ted a daily allowance of pozoli, or boiled maize, in
order to induce them to attend to the religious ex-
ercises and instructions of the holy father. But
what was given as a favour was soon claimed as a
right; and the Californians, pleased with the maize,
demanded a larger allowance than usual, which be-
ing refused, they broke out into complaints, which
in a short time ended in open hostilities. They sur-
rounded the Spanish garrison, and threatened them
with destruction. They twice attempted to carry off
their cattle, and even stole the only horse belonging
to the mission. But, by the determined courage and
perseverance of the Spaniards, they were reduced to
submission, and treated with the same kindness and
attention. The father continued his instructions,
and the maize was served out as formerly. The in-
constancy and ingratitude of this people, however,
was such, that it was found impossible to bind them,
either by promises or affection; and it was not with-
out much difficulty, and after submitting to many
hardships and deprivations, that they had the pros-
pect of rendering this colony a permanent establish-
ment. They had not only to struggle against the incle-
mencies of the climate, and the hostility of the inha-
bbitants, but also against the calamities and appearance
of their own countrymen. Success had frequent-
ly been promised, but as often withheld; and Father
Salva Tierra, saw himself, at one time, on the point
of abandoning for ever the conversion of the Califor-
nians, from the impossibility of procuring a sufficient
subsistence for the missionaries, and others employed
in the enterprise. Their zeal, however, at last sur-
mounted every opposition, and in a few years several
missions and presidios were founded throughout the
peninsula. Whatever were the motives by which
these men were actuated, whether by a love of power,
or a serious regard for the propagation and interest
of religion, we cannot deny them the merit of explor-
ing this neglected province, of civilizing its rude
benighted inhabitants, and of bringing many of them
to the knowledge of Christianity. Though their la-
bours have not succeeded, either according to their
zeal or their expectations, yet the cause of the failure
did not lie with them, but with the nature and situation
of the country. The peninsula of California is bar-
ren and unwholesome, while the neighbouring pro-
vinces of Sonora and Cinaloa, on the eastern side of
the gulf, present to the Spaniards abundant mines
and a fertile soil, objects more precious in their eyes
than the precarious wealth arising from the fishery
of pearls, which is the only attraction of Old Cali-
ifornia. It is owing to this circumstance, that both
the spiritual and temporal progress of these mis-
sions have been very slow. This country can boast
of only one Spanish colony; and "4000 In-
dians," says La Perouse, "converted and collected
in its fifteen parishes, are the sole fruit of the
long apostleship of the different religious orders
which have succeeded each other in this painful mi-
istry." Loretto is the only presidio of Old Cali-
ifornia. Its garrison consists of 54 troopers, who
furnish small detachments to its fifteen dependent
missions, which are San Vincente, San Domingo, El
Rosario, San Fernandez, San Francisco de Borgia,
San Gertrude, San Ignacio, La Guadalupe, Santa
Rosalia, La Conception, San Jose, San Francisco
Xavier, Loretto, San Jose de Cabo Lucas, and
Todos los Santos. The population of this peninsula,
however, within the last forty years, has been rap-

CALIFORNIA.

According to M. Humboldt, the population of New California, including the Indians attached to the soil, and who have begun to cultivate their fields, was doubled in twelve years. In 1790, there were 7748 souls, and in 1802 they had increased to 15,630. Since the foundation of the missions, there were in all, according to the parish registers, 53,717 baptisms, 8000 marriages, and 16,981 deaths. These registers, however, must not be assumed as data from which we may deduce the proportion of births and deaths, as in the number of baptisms the adult Indians are confounded with the children. The number of Whites, Mostizoes, and Mulatos, may be fully estimated at 1300, upon whom alone the government can depend for the defense of the coast, in case of any military attack by an European power. The smallness of this number, so disproportionate to the fertility and extent of the country, is owing entirely to the absurd regulations by which the Spanish presidios are governed, and the principles of colonization followed by Spain, which are in general directly opposite to the true interests, both of the mother country and colonies. "It is truly distressing," says the Spanish navigator Galiano, "that the military, who pass a painful and laborious life, cannot in their old age settle in the country, and employ themselves in agriculture. The prohibition of building houses in the neighbourhood of the presidio is contrary to all the dictates of sound policy. If the whites were permitted to employ themselves in the cultivation of the soil, and the rearing of cattle, and if the military, by establishing their wives and children in cottages, could prepare an asylum against the indigence to which they are too frequently exposed in their old age, New California would soon become a flourishing colony, and resting place of the greatest utility for the Spanish navigators, who trade between Peru, Mexico, and the Philippine Islands."

The governor of the Californias resides at Monterey, with a salary of 4000 piastres. His authority is confined entirely to the garrisons and the independent Indians; for he is not allowed to interfere with the affairs of the different missions, but is only obliged to grant assistance when they claim it. His real subjects consist only of four hundred military, distributed in the different presidios, which are all the means that are required for keeping in subjection about 50,000 wandering Indians. Every parish is governed by two missionaries, whose authority over the converted Indians is absolute; and the domestic economy of each mission differs scarcely in any respects from the regulations of a West India plantation. "The men and women," says La Perouse, "are assembled by the sound of a bell; one of the priests conducts them to their work, to church, and to all their other exercise. We mention it with pain, the resemblance is so perfect, that we saw men and women loaded with irons, others in the stocks, and at length the noise of the strokes of a whip struck

our ears, this punishment being also admitted, but not exercised with much severity." The utmost regularity and order pervades these religious communities. Seven hours a day are allotted to labour, and two to prayers; they have each a certain allowance of food, which consists of boiled corn and maize, and which is prepared and served out in the morning, at noon, and in the evening. On festivals, the ration is beef, which many of them eat raw. Corporal punishments are inflicted on both sexes, for the neglect of pious exercises, or for the smallest dishonesty; that of the women, however, is private, while the men are exposed to the view of all their fellow converts, that their punishment may serve as an example. As soon as an Indian is baptised, he immediately becomes a member of the community, and subject to its laws. On no pretence whatever is he allowed to return to his rancheria or family; his fate is as decided as if he had pronounced eternal vows, and should he escape, he is brought back by force, and under pain of the lash is compelled to join in the solemn devotions of the altar, and to offer up his unwilling prayers to that Being who desires not the homage of the lips, but the free and unreserved worship of the heart. This system of government has been attempted to be justified from the character and disposition of its subjects. They are represented as a nation of children that never arrive at manhood: they are small and weak, entirely destitute of that love of liberty and independence which characterises the northern nations, and equally ignorant of their industry and arts. They have very few ideas, are almost incapable of reasoning, and have so little stability, that unless continually treated as children, they would escape from those who have been at the trouble of instructing them, and again return to their original barbarism. But if the Californian Indian be so destitute of the ideas and qualities of men as he is represented, by the present principles of Spanish legislation, he will be continually kept so. He has no property that he can call his own. His labour and actions are entirely under the direction of his masters, whom he has been taught to regard as superior beings, who hold an immediate and constant intercourse with God; and thus he is retained in that very species of ignorance which it should be their chief study to eradicate. "Would it be impossible," says La Perouse, "for an ardent zeal, and an extraordinary patience, to convince a small number of families of the advantages of a society founded on the rights of the people? to establish a right of property among them, which is so bewitching to all men; and thus, by this new order of things, to engage each man to cultivate his field with emulation, or to dedicate his time to some other kind of employment." It must be allowed, however, that though the executive power of the missionaries is absolute and uncontrolled, the Indian converts throughout this country are governed with the greatest mildness and humanity.

We shall now proceed to give a general description of this province, with a short account of its various productions. In such an extent of country it cannot be expected that the temperature of the air should be uniform. Accordingly we find in California a very great variety of climate. In the northern province the sky is often foggy, and very cold winds sometimes blow with impetuosity from the north and north west; but the climate, in general, is much more mild than in any similar situation of the same latitude on the eastern coast of America. In the central districts of the peninsula the air is excessively dry and sultry; but in the southern parts it is more moderate, and of a more kindly quality, the heat being tempered by its proximity to the ocean; and towards the northern extremity of the gulf, in the same seasons of the year, the water even freezes. The sky is constantly serene, of a deep blue colour, and without a cloud; and it has been frequently observed, that should any clouds appear for a moment at the setting of the sun, they display the most beautiful shades of violet, purple, and green; a phenomenon which is supposed to depend upon a particular state of the vesicular vapour, and the purity of the air.

Old California is in general barren, wild, and rugged, and overrun with rocks and sand. A chain of mountains stretches along the interior, of which the most elevated, the Cerro de la Giganta, is from 4500 to 5000 feet above the level of the sea, and appears to be of volcanic origin. They are almost totally bare of verdure, or at most only covered with small shrubs, briars, and low trees. Among these mountains, however, are interspersed several valleys of tolerable soil; and some of the plains, particularly in the vicinity of the coast, are well adapted both for pasture and tillage, and might be greatly improved by cultivation. Its greatest deficiency is the scarcity of water. From Cape San Lucas to the river Colorado, an extent of nearly 200 leagues, there are only two streams that run into the Gulf of California; the one passes through the mission of San Josef, and discharges itself into the bay of S. Barnabas; the other is the Mulege, which waters the mission of Santa Rosalia. The currents which descend on the eastern side of the mountains, are far from being numerous; but their course and position have not yet been distinctly ascertained. Several springs are scattered throughout the country, whose waters, except in times of great rain, are swallowed up in the arid sand long before they reach the ocean.—"Through a particular fatality," says M. Humboldt, "it is remarked, that the rock is naked where the water rushes out, while there is no water where the rock is covered with vegetable earth. Wherever springs and earth happen to be together, the fertility of the soil is immense; and it was in these places, of which the number is far from great, that the Jesuits established their first missions." New California, however, has a very different appearance. It is well watered, woody, and fertile; and is one of the most picturesque countries in the world. Frequent fogs and dews give vigour and vegetation to the soil, which consists of a black spongy earth, and produces in great abundance many of the first necessities of life. Wheat, maize, barley, beans, lentiles, &c. are cultivated in the fields; and most of the roots and fruit-trees of Spain have been carefully introduced into the gardens of the Indians. They have, besides, plantains, bananas, cocoa-nuts, sugar-canies, indigo; and a great variety of
small herbs and plants. One species of these plants, called *pituca*, supplies the Indians with thread for making their nets, and other purposes; and of others they make a kind of plates and baskets, of a very elegant and intricate workmanship. Of the same herbs, the inhabitants on the banks of the Colorado form little tubs, called *coritas*, which generally hold about two bushels of maize, and with which they transport their goods from one shore to another, without being the least damaged by the water, by swimming and pushing them before them. Wild vines grow in the interior of the country, and yield very large grapes, but of a very sour quality; and European vines and olives have been cultivated here with great success. Good wine is made in all the villages along the coast as far as the 37th degree of north latitude; and near San Diego, oil is made of as excellent a quality as any in Andalusia. But the principal and most useful of all the indigenous trees of California, is the *pitayaya*, a kind of beeche, the fruit of which formerly constituted the great harvest of the poor inhabitants. It is chiefly found in a dry soil, and differs in appearance from all other trees. It has no leaves, and the fruit grows to the boughs, which are fluted, and rise vertically from the stem, forming a very beautiful top. The fruit is like a horse chestnut, and full of prickles; but the pulp resembles that of a fig, only more soft and luxurious, but always of an exquisite taste. The most valuable quality of this fruit, however, is its being a specific against the distemper de Loanda.

This country abounds with domestic animals, and fish and game of every description. Hares and rabbits are very common, and the trees are inhabited by the most delightful birds. The thickets are stocked with small grey tufted partridges, which are extremely well flavoured, and feed in large companies of three or four hundred. On the ponds and sea-shore are wild ducks, grey and white pelicans, gulls, cormorants, curlews, ring-plovers, small sea water hens, and heron. The forests are filled with stags of a gigantic size. Flocks of forty and fifty of them are frequently seen browning at a time. They are of a brown colour, with large branches nearly 44 feet long, and are considered as among the most beautiful animals in Spanish America. These stags, which are not found in Old California, surprised Sebastian Viscaino, when he visited this country in 1602. He asserts that he saw some whose branches were nearly nine feet in length. They are amazingly fleet, and can scarcely be taken, except by artifice, which is practised with great success by the Indians of this country. They fix a stag's head, with its long branches, upon their own, and, armed with a bow and arrows, they creep on all fours, and by half concealing themselves among the brushwood and long grass, and imitating the motion of a stag when feeding, they draw around them the unsuspecting herd, who become the victims of the deception. This method of hunting was seen by La Perouse, in the savannas in the neighbourhood of Monterey; and the Indian played his part so well, that some of the French hunters would have fired at him, had they not been prevented. The skins of these animals, when dressed by the inhabitants, might be converted into a very considerable branch of commerce. A more profitable article, however, is the otter-skins, of which there are here a prodigious number. Until 1786, the Spaniards never suspected that these skins were of any value, and never thought of sending them to Europe; but the government, being informed that a trade in this valuable peltry would be productive of the greatest advantages, have reserved the exclusive commerce of them to itself; and it is supposed, that the number of otter-skins, if properly collected in New California, would annually amount to nearly 30,000. The Indians who inhabit the missions are sometimes employed in spinning coarse woollen stuff, called *frisadas*, and also a kind of cotton, which they extract from the pod of certain fruits. But the principal employment of the converted Californians is agriculture; and the cultivation of this country has increased with great rapidity within these last twenty years. In 1791, the black cattle throughout the whole of this in endancy amounted to 24,953, which in 1802 were increased to 67,782, besides 107,172 sheep, 1040 hogs, 2187 horses, and 879 mules. During the same period, the cultivation of grain was more than doubled. In 1791, according to the tables of M. Galiano, the Indians sowed only 874 fanegas of wheat, which yielded a harvest of 15,197 fanegas; while, in 1802, 2089 fanegas were sown, and the produce 33,576 fanegas. "This progress of agriculture," says M. Humboldt, "this peaceful conquest of industry, is so much the more interesting, as the natives of this coast, very different from those of Nootka and Norfolk bay, were only thirty years ago a wandering tribe, subsisting on fishing and hunting, and cultivating no sort of vegetables." So much, however, cannot be said for the peninsula of Old California. The few fertile spots produce sufficiently luxuriant crops of maize, wheat, French beans, garnavoz, or a kind of pea, and all sorts of esculenta; and the vines which have been cultivated here, yield excellent grapes, the wine of which resembles that of the Canary Islands. But the arid nature of the soil, and the want of water and vegetable earth in the interior, must always prevent this country from maintaining a numerous population. The aridity of the soil, however, is in some degree compensated by the immense quantities of fish, and almost every species of pearl oysters, which are found upon its coast; and these last have been the chief inducement to adventurers during two centuries for visiting this desert country. These oysters are most abundant in the southern part of the peninsula, particularly in the bay of Ceralvo, and round the islands of Santa Cruz and San Joaquin. They lie in great numbers on banks in the gulf, which are commonly called *hostias*, in three or four fathoms water; and may be seen as plain as if they were on the surface. The pearls are very beautiful and large, but frequently of an irregular figure. This fishing has been a source of great wealth to the Spanish colonists; and indeed since the cessation of the pearl fishery near the island of Marguerite, the guls of California and Panama are the only places in Spanish America which supply pearls for the commerce of Europe. This branch of commerce has of late years very much fallen off, owing to the avarice and vio
Caligula, the fourth of the Roman emperors, was the son of Germanicus, the adopted son of Tiberius. He was born on the 31st day of August, in the year of Rome 765, and the twelfth of our era. Being brought up from his infancy in the camp, his mother Agrippina, an able intriguing woman, wishing to make him popular, always dressed him in the habit of a common soldier, or caligata, so termed from wearing the caliga, or military boot; from which circumstance, Caius was affec- tionately distinguished among the men by the name of Caligula, or the little private. Soon after the death of his lamented father, whom he had accompanied in the expedition to Syria, Caligula returned home, and lived with his mother, who, in a short time, incurring the suspicions of Tiberius, was banished by the senate. He then removed to the house of Livia Augusta, at whose funeral obsequies he pronounced an oration, though yet but a stripling; and having resided for some time with his grandmother Antonia, he was summoned, in the twentieth year of his age, when he assumed the toga virilis, to attend his grandfather Tiberius to Capreae.

Tiberius seems at first to have had a favourable opinion of the talents of his grandson, as his principal motive in bringing him forward at this time, was to counterbalance the influence of Sejanus, now an object of jealousy to the tyrant. Caligula did everything in his power to recommend himself to the emperor. Not a word escaped his lips respecting the condemnation of his mother, and his two brothers; his fierce feelings he so carefully suppressed in the presence of Tiberius, that no insult or provocation could rouse him; and he so effectually studied and assumed the conduct, humours, language, and even tone of voice of the emperor, that it was soon remarked of him, that "never was there a better servant, nor a worse master." His natural disposition, however, which was ferocious and base beyond conception, occasionally broke out in spite of all his dissimulation. It was even then observed, that he eagerly attended at all executions and tortures; muffled up in a long garment, he prowled through the streets at night, and engaged in the lowest debaucheries; whilst proficiency in dancing, fencing, singing, and other accomplishments of the same nature, constituted the sole object of his ambition. So sensitive was Tiberius himself of the depravity of his character, that he often asserted, that Caius lived but to be the destruction of him and all around him, and confessed, that he was rearing a serpent for the Roman people, and a second Phaeton for the world.

About this period, Caligula was married to Junia Claudilla, or Claudia, daughter of Marcus Silanus, a most respectable senator; but Junia soon afterwards dying in childbirth, he attached himself to Ennia, the wife of Macro the pretorian prefect. This woman he won over to his purposes, under a solemn promise of marrying her on his accession; an event which, according to some, she and her husband materially contributed to accelerate, having, by the directions of Caligula, poisoned the emperor. The real intention of Tiberius with regard to the succession is not well ascertained. Well aware of the monstrous character of Caligula, he seems to have wished his rejection; but the memory of Germanicus, and the popularity of Caligula himself with the army, deterred him from any open attempt to exclude him. He therefore bequeathed the empire conjointly to him and his brother Tiberius Gemellus, a young lad of considerable promise. No sooner, however, was the breath out of the emperor, than the senate, instigated by a blind, hatred of the old tyrant, immediately cancelled the will, and appointed Caligula their sole master. This melancholy event took place A. D. 37.

The real character of Caligula being hitherto but little understood among the people, his accession was hailed with universal joy. During even the funeral procession of Tiberius, amid the victims, altars, glaring torches, and other customary demonstrations of woe, the giddy multitude, observing this hopeful favourite in his mourning attire, could not contain their raptures, but greeted him with their blessings and acclamations; and, in three months after his accession, 160,000 victims were sacrificed to the gods. On one occasion when he was indisposed, the people of Rome watched all night round the palace; many of them, in conformity to the superstition of the times, engaged to fight in single combat for his recovery; and some even devoted themselves to death, by a label which they displayed, as substitutes to Pluto for the life of the emperor.

The first acts of Caligula were by no means ill calculated to encourage this universal attachment. Besides showing a proper regard for the ashes of his
mother and brother, who had fallen sacrifices to the
jealousy of Tiberius, he pretended to burn all the
documents which might lead him to a knowledge of
those implicated in their condemnation. When a
memorial was presented to him respecting a design
on his life, his reply was, "that he was conscious of
no action for which he could be hated, and that he
was determined to shut his ears against all informers."
His conduct in other respects was equally flattering.
Among other popular actions, he banished from the
city all the infamous professors of vice, restored va-
ful privileges to the people, strengthened the au-
thority of the magistrates, was extremely nice as to
the qualifications and conduct of the knights, remitted
taxes, conferred donations, relieved distress, and, in
short, was much too good an emperor to continue so.
For all these reasons, a golden shield, among other
honours, was decreed to him, which was every year
to be borne in solemn procession to the capitol, by a
company of priests, followed by the whole senate;
while the children of the prime nobility, boys and
girls, were all to chant in regular cadence the praises
of this mighty benefactor.

The Roman people were destined soon to awake
from this delusive dream. Whether we are to as-
cribe his conduct to insanity, to the corruption of the
times, or to the genius of despotic authority, one
thing is certain, that Caligula disgraced the character
of human nature more than any other individual. There
is something in unlimited power, well calculated to
nurse and bring to perfection the caprices of human
nature; and to this circumstance we are probably, in
a great measure, to ascribe the whimsical benefi-
cence and the wanton barbarities of this and the
other tyrants who then governed the world. Sub-
jected to no control or responsibility by a political
constitution, furnished with no motives of fear or ul-
terior ambition, either in this world or in the next,
they were naturally impelled, like the inferior creatures,
by every motion of the animal fluids, and pardoned,
butchered, and oppressed, without any other reason
than the humour of the moment. Absolute princes
are always mad in proportion as they are powerful;
once above the consideration of law and public op-
inion, we are prepared for every inconsistency, and
every enormity.

One of the first public crimes of Caligula, was to
put to death Gemellus, the unfortunate youth already
mentioned. Silanus, too, his father-in-law, Macro
and his wife Ennia, and several others, all of them
zealous agents in promoting his accession, were re-
warded for their services with death. Many were the
persons of all ranks, who fell victims either to his po-
litical jealousy or to his caprice. An exile, who had
been banished by Tiberius, having returned, and be-
ing asked by Caligula how he had spent his time,
the man, by way of flattery, told him "that his con-
stant occupation was praying to the gods that Tibe-
r ius might be destroyed, and Caligula advanced in his
room;" upon this, thinking that those exiled by
himself would in like manner wish for his destruc-
tion, Caligula sent his executioners through all the
islands, to put the whole of them to death. His in-
mate love of cruelty exceeds belief. He never al-
lowed the executioner to finish criminals by one great
blow; but ordered him to proceed by minute and
frequent strokes, that they might feel themselves dy-
ing. The slightest offence, such as omitting to
swear by himself, often provoked him to extremities.
It was one luxury of his to compel fathers to wit-
ness the execution of their sons; and, on one occa-
sion, when an apology was sent, he invited the
wretched man to a magnificent banquet, and assuming
all the ease and gaiety of which he was capable, en-
tertained him with the utmost merriment and jocula-
ty. Caligula was frequently heard to lament, that
his times were not distinguished by some signal ca-
lamity. Sensible that his tyrannical conduct made
him an object of universal detestation, his common
maxim was, oderint dum metuant, "let them hate me,
provided they fear me;" and once, when the people
hisled in disapprobation of his pursuits, his rage burst
out in the horrible wish, that the Roman people bad
but one neck, which he might cut off at a blow.

The monster, sometimes attempted with the minds
of his butcheries. Some Gauls and Greeks having
been condemned together, probably for the sake of
the execrable pun, he boasted that he had done for
Gallogracia. A military gentleman having gone
for his health to Greece, and petitioned from time to
time for a renewal of his leave of absence, the tyrant at
last ordered him to be slain, adding, that as medicine
had been of no service to him, blood-letting was abso-
lutely necessary. Even in his most pleasant moods,
this tremendous jester thought of nothing but blood.
When kissing the neck of his wife or mistress, he
frequently remarked, "pretty as this neck is, off it goes the moment I order it." One day at a
sumptuous banquet, he suddenly burst out into
laughter, upon which the two consuls, who reclined
by him, politely ventured to den and the cause of
his imperial merriment. "I was only thinking," re-
p lied Caligula, "how easily, by a single nod, I could
assassinate both of you." His jest with Apelles
the tragedian was more serious, whom he ordered to
be flogged most unmercifully, that he might hear, in
their native excellence, the fine tones and inflexions
of voice of that actor.

It would be disgusting to enumerate the various
acts of oppression, by taxation, pillage, torture, and
murder, recorded of this wretch, who was also equally
infamous for his effeminacy and horrible debaucheries.
His incestuous passion for his own sisters is well
known. His sister Drusilla, with whom he had been
detected in scandalous familiarities when a boy, he
now actually married; and he bewailed her death
with the most extravagant frenzy of grief. His next
madness was, like Alexander the Great, to give him-
self out for a god. He actually built a temple to
his own divinity, and instituted a priesthood, alters,
and sacrifices in honour of himself; and sometimes
exhibited himself among a crowd of statues of his
brother gods, being consulted by the people, and
giving responses. As a deity of equal rank, he
used to invoke the full moon to his embraces at
night. He likewise held private conferences with
Jupiter Capitolinus, at one time muttering some-
thing in a low voice, at another, gravely listening;
and was not unfrequently heard to remonstrate with the other god in pretty sharp language. All this folly was scarcely more extravagant than his fondness for his horse Incitatus. In honour of this animal, he built a magnificnt palace, appointed domestics, and supported a splendid table, to which people were invited in the name of the horse. He moreover accommodated the steed himself with a marble stable, and an ivory rack, gave him gilt halter, and wine out of a golden cup, aware by his health and fortune, and, according to some, intended to make him consul.

In his public transactions, Caligula was equally extravagant and cruel. He engaged in immense undertakings, such as filling up vallies, and levelling mountains, merely because they were deemed impossible. Among these, his famous bridge at Baiae was none of the least. This bridge, supported on two rows of bôats, consisted of large beams of timber, over which was placed a bank of earth, faced and paved with solid masonry, so as to resemble the Appian way; and extended over the sea from Baiae to Puteoli, being a distance of nearly four miles. Along this floating structure, Caligula paraded on horseback and in chariots for two successive days; and to add variety to the scene, having invited a great number of people to view the bridge, he tossed them all into the sea, and there knocked them on the head with oars and poles to keep them under water. Wishing now to appear in the character of a conqueror, he ordered an expedition to be prepared with the utmost haste, resolving to conduct it in person into the heart of Germany. His march through Gaul was sometimes so rapid, that the standard-bearers could not keep pace with the troops; on other occasions it was so extremely slow, that he waited to have the roads swept and sprinkled with water by the inhabitants of the country. When in the act of crossing the Rhine, some person unluckily expressed his uneasiness lest the Germans might now be at hand; upon which Caligula was so frightened, that he suddenly turned back, and would not wait till the bridge was cleared, but was handed over the heads of the soldiers to the other side of the river. Soon after, in order to retrieve his character, having commanded some German deserters to be stationed privately in a wood, and a report to be suddenly spread in the camp that the enemy was near, he put himself courageously at the head of his guards, and assuming the air of a great hero, sailed out in quest of the foe, scoured the forest, and then ordered a great number of trees to be converted into bare trunks, on which to erect the trophies of his victory. On his return from this glorious campaign, he nearly ruined Gaul with enormous exactions, in order to defray the expenses of another expedition against the ocean, which he had determined to conquer. For this purpose, having drawn up his legions on the beach, arranged his battering rams and other military engines, and ordered the trumpets to sound preparatory to the charge, he suddenly commanded the soldiers to stoop down and fill their helmets with shells, which he called the spoils of the ocean. In commemoration of this victory, he built a lofty tower on the spot, on which a light was kept burning for the direction of mariners. The next care of the conqueror, after announcing, by letters, all these exploits to the senate, was to make arrangements for his triumph, which he resolved should be very magnificent. Great numbers of Gauls, the tallest that could be found, were engaged for moving in the character of German captives in the procession. These were compelled to dye their hair of a red colour, to assume various uncouth dresses, and to pronounce occasionally some hard words, resembling German and other savage languages.

These childish follies were succeeded by a design of a more serious nature. Recollecting that some legions had once mutinied against his father, Caligula resolved, like a strict disciplinarian, now to decimate them. With this view, he summoned them to appear before him without their arms, while his cavalry was observed ready to surround them; but the legions suspecting some treachery, put themselves in a posture of defence; upon which the tyrant fled to Rome, to wreak his vengeance on the worthless senate.

The public patience began now to be nearly exhausted; plots and conspiracies began to be talked of, and a formidable combination, headed by Lucius Getulius and Marcus Lepidus, was discovered. Many were the deaths which this conspiracy occasioned. Caligula now kept regular lists of those intended for destruction, and seems to have meditated the horrible design of cutting off the whole senate, with a great proportion of the principal knights. His odious career, however, was now drawing to a close. Cassius Cherea, a brave officer, but unfortunate in having a very effeminate voice, being ridiculed on this account by Caligula, and exposed by his indecent jests to the derision of others, resolved to rid the world of the monster; and many other Romans, exasperated in like manner by insult and oppression, joined him in the project. After a variety of disappointments and narrow escapes, the conspirators at last found an opportunity of executing their design, amid the confusion of a festival. While the emperor was passing from the theatre to the palace, during the celebration of the games in honour of Augustus, Cherea gave him a wound in the neck, and the other conspirators rushing upon him at once, dispatched him by repeated blows, none offering to assist him. His carcass was allowed to remain on the spot where it fell till night, when either his wife or Agrippa employed some person to remove it, and committed it half burnt to the earth. Not content with his own death, the conspirators resolved to exterminate his whole family, and accordingly one of their party, that very night, put to death his wife Cesonis, and his infant daughter, who is said to have already manifested the ferocious disposition of her father.

Thus perished, A. D. 41, in the 29th year of his age, after a reign of three years and ten months, one of the most odious tyrants that ever afflicted the human race. No sooner were the tidings of his death sufficiently confirmed, than the people gave loose reins to their indignation. His statues were instantly pulled down, his capricious laws annulled, and his memory as much as possible obliterated. The external appearance of Caligula was no bad emblem of his mind,—his form, features, complexion, and gestures,
all conspiring to produce a sensation of disgust and horror. His countenance, which was naturally repellent, was, in this respect, improved by art, for we are told that he practised at his mirror all the frowns and distortions of face which he deemed best calculated to inspire terror. He was not deficient either in talents or education; and would have made no contemptible figure as an orator; but his chief attention was directed to the acquisition of fame as a dancer, musician, gladiator, and charioteer. Caprice and cruelty, those constant attributes of tyranny, were the most prominent features of this disposition, and, combined with sensuality and cowardice, formed nearly the whole of his character. As Seneca justly observes, Caligula seems to have been produced by nature for the purpose of shewing what mischief could be accomplished by the greatest depravity, supported by the greatest power. See Senecius. Universal History. Crevier. (b)

CALIPH, or KHALIF, the title by which the successors of Mahomet were distinguished. As the history of the caliphs has already been given in its proper place, (see ARABIA), all we propose at present is to give a short sketch of their general character, and of the nature of the office with which they were invested.

The immediate successors of the founder of a new religion, and a new empire, widely extended, but not yet fully confirmed, found themselves under the necessity of imitating the qualities, by which he had succeeded in establishing his character as a prophet, and his power as a sovereign. An affectation of enthusiastic devotion, and of rigid austerity, was essential to the impostor, who pretended an immediate commission from heaven. The piety of Mahomet was habitual and ardent; his pretended intercourse with the Almighty, frequent and ostentatious; and, except in one species of indulgence, which he granted liberally to the faithful, and which formed the most attractive allurement of his paradise, his temperance and sobriety were singular and exemplary. In these qualities he seemed even to be surpassed by the enthusiasm, the austerity, and the abstinence of the first caliphs. All the time which they could spare from the duties of royalty, was spent in prayer or in preaching, before the sepulchre of the prophet. Abubeker, on being elected to the caliphate, ordered his daughter Ayesha to take a strict account of his private patrimony, that it might be easily ascertained by his subjects, how far he was enriched or impoverished by his exalted office. He claimed, as his just reward for the service of the state, an annual salary of three pieces of gold, with the maintenance of a single camel, and a black slave; but on the Friday of each week he distributed the remainder of his private fortune, and the public treasure, amongst the most worthy and the most indigent of the Moslems; a coarse garment, and five pieces of gold, were all the riches he had to bequeath to his successor. The mortifications and the humility of Omar were still more rigid, or more ostentatious than those of Abubeker. Barley bread, or dates, were his only food; water was his drink; his gown was torn in twelve places; and a Persian satrap, who came to do him homage, found him asleep among beggars on the steps of the mosque of Medina.

An usurper, who, without any peculiar advantages of wealth or family, proposes to raise himself to absolute power, must secure the affections and the confidence of his countrymen, by profuse liberality, in- sinuating affability, and humble condescension. The pretended apostle of God, satisfied with the power of royalty, affected to disdain its pomp; submitted even to the menial offices of the family; kindled the fire; milked the ewes; and mended with his own hands his shoes and his garments. His faithful adherents were rewarded by munificent presents; the wavering were confirmed by splendid promises; and all his countrymen were gratified by the gracious smile of the prophet, who imposed on them the yoke of spiritual and temporal bondage. These popular qualifications were cultivated with no less attention and effect by the earliest of his successors. Multitudes were fed by the bounty of Abubeker, the mildness and condescension of whose general demeanour conciliated every heart. The manners of Omar were equally modest and unassuming; and his bounty, like his treasures, was still more ample than that of his amiable predecessor. To Abbas, the uncle of the prophet, he assigned an allowance of twenty-five thousand pieces of silver; to each of the aged warriors, who survived the battle of Beder, he allotted five thousand pieces; and rewarded with an annual pension of three thousand, the last and meanest of the followers of Mahomet.

To found a new dynasty among a people so enterprising and warlike as the Arabs, required the dazzling accomplishments of a hero, as well as the sanctity of a prophet, and the prudence and sagacity of a statesman. The splendid victories of Mahomet were continually adding credibility to his pretensions as the messenger of God, commissioned to propagate the true religion, by persuasion or by the sword; to convert or to exterminate the unbelieving nations throughout the world. His successors gloried in the distinction of being commanders of the faithful. The warlike virtues of Abubeker, Omar, and Othman, had been displayed under the banners of the prophet; and the hope of dominion, or of paradise, made them ready to encounter every peril in the propagation of the faith. Omar, in his reign of ten years, reduced thirty-six thousand cities, or strong-holds, to his obedience; demolished four thousand churches or temples of the infidels; and erected fourteen hundred mosques for the exercise of the Mahometan worship. In one hundred years after the flight of Mahomet from Mecca, the empire of his successors extended from India to the Atlantic ocean, comprehending the widely distant regions of Persia, Syria, Egypt, Africa, and Spain.

When the power of the caliphs was confirmed beyond the fear of revolution, they forgot the real or affected virtues, which their predecessors had found necessary to its acquisition. Their interest, indeed, prevented any abatement of their zeal for the extension of Islamism: but the moderation, the affability, the self-denial, even the courage by which the first caliphs were distinguished, soon gave way to the love
of pomp, of oppression, of luxury, and effeminacy, naturally inspired by uncontrolled dominion over countless myriads, and by the exhaustless resources of the richest portions of the globe. The cares of government were relinquished for the softening pleasures of the seraglio; the rewards, by which merit ought to have been encouraged, were appropriated by women and favourites; and even when a caliph took the field against an enemy, his camp was encumbered by the unwieldy luxury of the palace. The enervating influence of this example spread rapidly through the empire. The warlike ardour of the Saracens was quenched by their love of ease, and of debasing indulgence; and no promises or rewards could allure to the field the descendants of those enthusiastic champions, who had voluntarily crowded to the standards of Abucerker and Omar. After a duration of 656 years, the power of the caliphs was abolished by the Tartars, who captured the holy city of Bagdad, A. D. 1258, and put to death Al Mostasem Billah, the last of the race of Abbasides.

As the caliphs succeeded to the regal and sacerdotal offices which Mahomet had assumed, they were the most absolute monarchs in the world. No privileged order was recognized in the Arabian empire, to impose a salutary restraint on the will of the despot; and among a people, enslaved by superstition, and ignorant even of the name of liberty, no feelings of independence ever arose to prompt resistance to the tyranny of the vicar of the prophet, the vicegerent of God. The Koran was, indeed, presided over as the rule of their actions, and incalculates strongly the duties of justice and humanity; but they were themselves the judges and interpreters of that sacred code, nor was the most zealous Moslem at liberty to dispute their infallibility. In quality of imam, or high priest of the Mussulman religion, the caliph began the public prayers every Friday in the chief mosque, and delivered the khotbah, or sermon, animating his hearers to zeal and fidelity in their duties as true believers. The first part of this service was always performed by the caliphs in person, even when they affected the most pompous state, or were sunk in the most luxurious indulgence; but the utterance of the sermon was committed, in later times, to a deputy or assistant. It was part of the duty of the caliphs to conduct the pilgrims to Mecca, and to march at the head of the armies of his empire; and it was their prerogative to grant letters patent of investiture, as well as swords, standards, robes, and other insignia to the Mahometan princes, who, even after they had thrown off the yoke of the caliphate, continued to hold of it as vassals. The caliphs usually went to the mosques mounted on mules; and the sultans Selgincides, although masters of Bagdad, were compelled to hold their sturrups, and to lead their mules for some distance on foot, until they received from the caliph the sign of permission to mount on horseback. In short, the office of the caliphs, uniting spiritual influence with temporal power, bore a striking resemblance to that of the pope; and in their pomp, their haughtiness, and their oppression, little difference can be traced between the vicars of Mahomet, and the successors of Peter.

CALIPPIC YUG. See CHRONOLOGY.

CALLA, a genus of plants of the class Heptandria, and order Monogyunia. Linneus ranks this genus under Gynandria Polyandria; Schreber under Monoea Monandria; and Dr Smith under Monoea Polyandria. See BOTANY, p. 108.

CALLAHA El, from Calah, the top, is the name of a town in the western province of Algiers, and appears to be the Ghilbi or Apter of Ptolemy, from the number of large rivers. It is situated on an eminence on a range of mountains, which forms a part of Mount Atlas. Though larger than Mascar, from which it is distant about 5 leagues north east, it is dirty and irregular, and has neither pavements, causeways, nor drains. "There are several villages of the same nature, says Dr Shaw, and in the like situation, round about it; all of them profitably employed in the same manufacture of carpets and burnooses."* The Turks have a small garrison and citadel in this place. See Shaw's Travels in Barbary, vol. i. chap. ix. p. 71. Edinb. Edit. (n)

CALLANDER, a town of Scotland, in the county of Perth, is situated on the banks of the river Teith, a very considerable stream which issues from Loch Katrine, and discharges itself into the Forth. Calendar is built on both sides of the river, but principally on the northern side, and the river is crossed by a good stone bridge. It consists chiefly of one long street: the houses are well built, and covered with slate. In a square space, on the northern side of the street, and in the middle of the village, stands the parish church, which has a pavilion roof, and a spire over the pediment. Near the minister's house is the foundation of an old square castle, built or repaired in 1596, by Livingstone, Earl of Linlithgow. Since the introduction of the cotton manufactures, the town has been greatly extended. About 100 looms are employed in weaving muslin in Callander, and in the adjacent village of Kilmahog, and nearly 100 girls are occupied in the tambour manufacture. Since Loch Katrine became such a fashionable place of resort, Callander has been much frequented during the summer season, and a large and commodious inn has been built for the accommodation of travellers. Population of the village about 1000. See PERTHSHIRE. (o)

CALLAO, a sea-port town of Peru, situated on the west coast of South America, at the embouchure of the river Lima, and about 24 leagues from the city of Lima. Prior to the earthquake which happened in 1746, the Spaniards regarded this town as impregnable. It was defended by a garrison, and was fortified with bastions and batteries. Two of the suburbs were then inhabited by the Indians.

The harbour of Callao has always been regarded as the largest and most secure in the South Sea.
There are no rocks in the bay, and the water is very deep. As the winds which prevail here during the winter always blow between the south east and the south, but most generally from the south, the bay of Callao is always tranquil, being defended from the south winds by a long neck of land which projects into the sea, and by the large island of St Lawrence opposite to this cape, and the small islands of Fronton and El Corcobado. The river of Lima, which discharges itself into the sea under the walls of Callao, furnishes abundance of good water, and the loading and unloading of vessels is facilitated by a mole furnished with excellent cranes.

On the 20th of October 1657, at the second con- cussion of the earthquake, the sea retired within its usual limits, and returning in mountainous waves, overwhelmed Callao and the adjacent country. During the earthquake of 1746, this town suffered still greater devastations. The port of Callao and several of the buildings sunk into the ground; but this evil was nothing, compared to the dreadful catastrophe which succeeded it. “The sea,” says Ulloa, receding to a considerable distance from the shore, returned in mountainous waves, foaming with the violence of the agitation, and suddenly turned Callao and the neighbouring country into a sea. This was not, however, totally performed by the first swell of the waves, for the sea retiring further, returned with still more impetuosity, the stupendous water covering both the walls and other buildings of the place, so that whatever had escaped the first, was now totally over- whelmed by these terrible mountains of waves, and nothing remained except a piece of the wall of the port of Santa Cruz, as a memorial of this terrible de- vastation. There were then 23 ships and vessels, great and small in the harbour, of which 19 were ab- solutely sunk, and the other four, amongst which was a frigate called St Fermus, carried by the force of the waves to a great distance up the country. This terrible inundation extended to other parts on the coast, as Cavallos and Guapane. At Callao, where the number of inhabitants amounted to about 4000, two hundred only escaped; and twenty-two of these by means of the above-mentioned fragment of a wall.

The town of Callao has been rebuilt upon the same place, at the distance of a quarter of a league from the sea, and has been called Bella-vista. As Callao is the sea-port of Lima, a full account of its trade will be given under the article Lima. West Long. 76° 58', South Lat. 12° 1' 53". See Juan and Ulloa’s Voyage to South America, vol. ii. book vii. chap. viii. p. 82-84, in which will be found a plan of the port of Callao.

CALLAO, or according to Europeans, CAM- PELLO, a small island in the Chinese sea, stretching in a north westerly direction, along the coast of Cochinha, about 30 miles from the continent, and is nearly five miles long and two broad. Its eastern shore is rendered completely inaccessible by a continued range of overhanging cliffs and immense rocks, which in some places rise perpendicularly out of the sea; while the opposite side of the island is covered with verdure, and indented with several small sandy bays, affording safe and convenient stations for land- ing. These, however, are separated from each other by steep and rugged ridges, which renders all com- munication between them by land extremely diffi-

cult.

At the bottom of one of the largest of these bays, is a fertile valley, containing about two hundred acres, where the ground rises gently towards the cast, and is bounded on each side with lofty moun- tains, the highest of which is about 1500 feet above the level of the sea. “This small but enchanting spot,” says Mr Barrow, “is beautifully diversified with neat houses, temples, clumps of trees, small hillocks swelling from the plain, and richly decorated with shrubbery and trees of various kinds; among which the elegant areca, rising like a Corinthian column, is eminently conspicuous.” This is the only inhabited part of the island; and the principal vil- lage, which stands upon the margin of the beach, contains about 30 habitations. A few of the houses are built of stone and roofed with tiles, but the rest are constructed entirely of bamboo, and have a very neat and cleanly appearance. About 30 others are scattered over the valley, behind each of which are enclosures of sugar canes, tobacco, and other vege- tables; at the head of the village is a house larger than any of the rest, which Mr Barrow supposed to be the habitation of the chief person of the island. It was divided into a number of apartments, and en- closed by a stone wall; and the approach to it was through a gateway between two stone pillars. On the side of the hill behind the village, is a cave, ac- cessible only by one path, through an irregular range of rocks; and at its mouth is a small temple, which commands a view of the whole plain. This temple is open in front, with a colonnade before it of round wooden pillars, painted red and varnished. Several others of the same construction are dispersed up and down the valley. The inhabitants rear a few goats on the sides of the mountains, which are covered with luxuriant pasture; and they water their rice fields by carrying a small rivulet along the upper ridges of the vale, and conveying it through sluices, as occasion requires, to the grounds below.

When Mr Barrow visited this place, the principal inhabitants, terrified at the approach of a strange ves- sel, embarked in their gallies and left the island; and as none of the people whom he met with could un- derstand his Chinese interpreter, he was obliged to have recourse to hieroglyphics, and to draw the fig- ures of such articles as he wished to purchase. Pou- ltry and fruits were immediately brought, for which he paid high prices, in order to conciliate the good will of the islanders. See Barrow’s Voyage to Cochinchina; or, Staunton’s Account of an Embassy to China, vol. i. p. 366, &c. (l)

CALLE, LA, a seaport town of Algiers, in the province of Constantine. The sea surrounds it on three sides, and the other side is defended by a strong wall. About the year 1560, a company of merchants from Marseilles built a fort near this place for the protection of their magazine of corn, and of the boats in which they carried on the coral fishery. The Algerines speedily demolished this fort, under the pretence that the French had carried off so much corn as to occasion a famine in the country; but in 1728 Louis XIII. sent an engineer to build another
the Bastion of France, at a little distance to the east of the former ones. The foundations were scarcely laid, when the Moors and Arabs again destroyed it, and compelled the engineer to re-embark. The French king, however, unwilling to abandon his plan, completed the fort a few years afterwards, and the French African Company established themselves in the place. The insubility of the situation, arising from the ponds and marshes which are adjacent to it, induced the company to enter into an agreement with the Dey of Algiers, by which they were permitted to remove to La Calle, another inlet about three leagues to the east, and to carry on a free commerce with the Moors and Arabs. At La Calle, they had a magnificent house and garden, three hundred coral fishers, a company of soldiers, several pieces of ordnance, and a place of arms. The rest of the town consists of mean huts, inhabited by the lower orders from Marseilles, who were employed in the service of the company. “Besides the advantages of the coral fishery,” says Dr Shaw, “and of the whole trade of the circumjacent country, they have also at Bona, Tuckush, Siggata, and Cull, the monopoly of corn, wool, hides, and wax; from which they pay yearly to the government of Algiers, to the Kaid of Bona, and to the chiefs of the neighbouring Arabs, 30,000 dollars, i.e. about 5000 guineas of our money—a trifling sum for such great privileges.” Dr Shaw thinks that the Bastion and La Calle are too near each other to be taken for the Diana and Nalpotes of the Itinerary, though he is of opinion that they ought to be looked for in that situation. Population about 400. West Long. 8° 50'. North Lat. 36° 50'. See Shaw’s Travels in Barbary, vol. i. p. 111. Edin. edit. chap. vii. (a)

CALLEN, a port town of Ireland, in the county of Kilkenny and province of Leinster. The principal objects deserving of notice in this place, are the ruins of an abbey, and three castles, with some traces of walls which Cromwell is said to have destroyed, and a moss about 40 feet high, with a flat top 138 feet by 72. About 3600 acres of fine ground, with a limestone bottom, are included within the liberties of the town, and a common of 1500 acres, which has been greatly diminished by encroachments, belong to the inhabitants. There is here a distillery, and some lace is manufactured in the towns. The seven fairs which are held at Calen, are remarkable for the sale of horses and turkeys. Great quantities of the latter are bought up for the purpose of being sent to Bristol. Number of houses 582. Population 3500. West Long. 7° 34'. North Lat. 52° 32'. (n)

CALLICARPA, a genus of plants of the class Tetrandria, and order Monogynia. See Botany, p. 119.

CALLICOCCA. See CEPHALES, and Botany, p. 150.

CALLIGONUM, a genus of plants of the class Dodecandria, and order Tetragnia. See Botany, p. 226.

CALLIMACHUS, a celebrated Greek poet and grammarian, was born at Cyrene, in Libya, flourished at Alexandria in the reigns of Ptolemy Philadelphia, and Ptolemy Euergetes, and died about the year 244 B.C. He was the son or descendant of Batus; whence he is called by Ovid Battidae. (Am. i. 14, 93. Tr. ii. 367. &c.) He studied under Hermocrates, the grammarian; and, before he attracted the notice of Ptolemy Philadelphus, taught a school at Alexandria, and had the honour of educating Apollonius, author of the Aragonantia.

The poetical compositions of Callimachus consisted chiefly of short pieces, such as hymns, elegies, and epigrams; and when it was remarked to him, that his powers seemed to be unequal to the production of any considerable work, he is said to have made use of the proverbial answer, “A great book is a great evil.” He was the author, however, of two works of greater length, entitled Hecate and Atitai.

Quintilian gives to Callimachus the first place among the elegiac poets of Greece. (Inst. Orat. x. 1.) Those of his compositions which have been preserved are admired for their elegance and classical spirit. The following, we believe, are the principal editions of his works. H. Stephen’s, 4to, 1577; Mad. Dacier’s, 4to, Paris, 1674; Graevius’s, 8vo, Utrecht, 1697; Bentley’s, 8vo, London, 1741; Ernests’, 8vo, Leyden, 1761; Loesner’s, 8vo, Leipsic, 1774. There is a translation of Callimachus, into English verse, by Dr Tytler, 4to, London, 1793. (z)

CALLISIA, a genus of plants of the class Triandria, and order Monogynia. See Botany, p. 96.

CALLISTHENES, a Greek historian and philosopher, was a native of Olynthus, a disciple and kinsman of Aristotle, and the contemporary of Alexander the Great, whom he accompanied in his expedition to the East. The austere temper, however, and unbending, republican spirit of Callisthenes, were but little calculated for the meridian of a court, and upon several occasions he gave great offence to the haughty monarch, by the freedom of his reflections. At length, when Alexander came to the impious and frantic resolution of assuming divine honours, Callisthenes not only refused to join the other courtiers in flattering his pretensions, but addressed to him a spirited remonstrance on the subject; which, however, had no other effect than to draw upon himself the implacable hatred of the prince. The conspiracy of Hermolaus furnished a pretext for implicating him in a charge of treason; though it does not appear that he was otherwise guilty, than by having uttered bold and unguarded expressions against tyranny. He was, however, arrested along with the other persons accused; and though it would seem that his fate was for some time suspended, it is certain that he suffered death in consequence of the charge which had been brought against him.

Callisthenes wrote a History of the Actions of Alexander, which is cited by several of the ancient authors. Many other works, which are not now extant, are also ascribed to him, or to some other writer of the same name. Among these are a History of Greece, comprehending 30 years from the peace of Antalcides; a History of the Trojan war; a Periplus; Persica; Macedonica; Thracica; and Metamorphoses. See Arrian, Exped. Alex. Plutarch, in Alex. Quintus Curtius. Voss. Hist. Græc. Fabr. Bib. Græc. (z)
CALLITRICHÉ, a genus of plants of the class Monandria, and order Digynia. See Botany, p. 83.

CALLIXENE, a genus of plants of the class Hexandria, and order Monogynia. See Botany, p. 194.

CALMAR, a sea-port town of Sweden, and the capital of a government of the same name, comprising the eastern part of Finland, and the Isle of Oeland. It is strongly situated upon the Baltic, opposite to the island of Oeland, from which it is separated by the straits of Calmar, about seven miles in breadth. The streets of this town are regular, and cross each other at right angles; and the new town is large, though not very populous. It is fortified with thick walls, built of pebble-stones found in the sea, and by a few earthen ramparts, supported by another wall, which the sea surrounds on all sides except at the gate. The avenues are either full of marshes, or are cut off by the sea, which beats upon a rocky coast. A long mole, built with stone, extends along the sea-side, and is defended by Fort Grimskar, erected on a rock about fifty paces from the mole, and surrounded by the sea. A garrison is constantly kept in this fort. On an eminence behind the old town stands the castle, which has the sea on one side, and on the other ramparts, bastions, and ditches full of water. This building, which has been erected at different times, is a mixture of Grecian and Gothic architecture. The inscription “John III. 1568,” is over one of the doors; but this must be the most modern part of the building, as the wall, 94 feet by 30, is still shown, in which the deputies of Sweden, Denmark, and Norway assembled, to choose their common sovereign. The palace, which was formerly the residence of the celebrated Margaret, is converted into a distillery. Calmar once occupied a different spot from what it does at present. In consequence of being burnt down in 1647, it was built near to the Isle of Quaraholm. The commerce of Calmar was formerly very considerable, but a great part of it has been transferred to Stockholm. It exports annually about 20,000 planks, 560 tons of alum, and a great quantity of hemp and tow. About 70 vessels from 100 to 300 tons are employed in this trade. Drabs and several other woollen stuffs are manufactured here. The town is nearly a mile in circumference, and contains about 500 houses. East Long. 60° 21' 45", North Lat. 56° 40' 30". (π)

CALMINA. See Calamo.

CALMUCKS, Oeloets, or Eluthis, supposed to be the Hippophagi of Phiny, and other ancient historians, are a tribe of independent Tartars, and a branch of those nomadizing barbarians, who, in the beginning of the 13th century, under the name of Moguls, and led on by Zengis Khan, subdued and desolated the finest provinces of Asia. They are the only Tartar nation that has retained the ancient language of the Moguls in all its purity. They have also preserved the manners, the dress, and the religion, which all historians have attributed to these conquerors; and their Contaish, or Great Khan, claims the honour of being the true descendant of the Great Zengis. The appellation of Calmuck was bestowed upon them by the Mahometan Tartars, as a term of reproach, on account of their pagan worship; but they pretend that they have a better right to the name of Moguls than their neighbours on the frontiers of China, now known by the name of Mongales; and indeed the territory of this people, in the beginning of the last century, embraced the very states which Zengis left as a patrimony to his successors, and comprehends the most considerable and richest part of Tartary. From the river Jaick, or Ural, on the west, their possessions extended along the southern boundaries of Siberia as far as the river Selings on the east, and skipping the empire of China, they reached on the south towards the confines of the kingdom of Ava. Turning then to the north-west, they were bounded by the Mogul empire, Great Bucharia, and Turkestan. These extensive territories, however, have been greatly curtailed by the encroachments of the Russians, and the adventurers of the Chinese.

The Calmucks were driven from Thibet in 1720, and about forty years after, Kiang Long extended his dominions as far as the mountains of Belor; so that such of the Calmucks as refused to submit to his authority, were compelled to seek for new settlements towards the west. Many of them dispersed themselves in the interior parts of Asia, and among the cities of the Usbeck Tartars; others took refuge in Russia; some thousands fled to Siberia; but the greatest number accommodated themselves to the Chinese sovereignty. At present the most numerous and powerful of the Calmuck hordes, according to Grostier, inhabit the country lying between the Caspian sea, Muscovy, Samarcand, and Cashgar. Others also occupy, with their flocks and herds, both banks of the Volga, between the Irgis and the Caspian, and extend their excursions on both sides of the Don and the Ural.

Before their subjugation and dispersion, the Calmucks were divided into three principal branches, viz. the Soongares, the Coschotes, and the Torgots. Of these, the Soongares were the richest and most formidable, and were engaged in almost perpetual hostilities with the Mongales and Chinese. They resided about the Balkhash lake, and its rivers Tchuy and Hly; and held in tribute the Great Kirguzian horde, and the towns of Little Bucharia. The Coschotes, upon the conquest of Thibet, became subject to the Chinese, and still continue under the protection of that power, except a smaller part which had retired to the Irtish, and fell under the dominion of the Soongares. Those under the dominion of China are estimated at 50,000, and are said to have derived their name, which implies warrior or hero, from the courage which they displayed in the wars of Zengis. The Torgots, who had separated from the Soongares, and had formed themselves into a particular horde, settled at an early period among the steppes on the Volga, and received from the Russians the appellation of the Volgaic Calmucks. But many of them being disgusted by the interference of the Russian government respecting the authority of their tsah, or chan, returned in great numbers in 1770 and 1771, over the river Ural on the ice, and across the Kirgusian steppes in
The waters of the vast ocean,
When it has raged with all its fury, becomes itself again;
This is the course of the world; and likewise still to forget.

Ye white herds, with the marks of Schabiner!
Thou prince Schereng, in the van as conductor,
Riding on thy noble reddish bay horse;
The Prince Zebek following with his numerous troop,
Ah! Ubschakhan, conduct us now the Torgots!

There over rocks, over stones, and rough places,
The herds drag themselves along, and become lean,
By flying over the land all covered with snow and frost.
Ah! how the droves trot over the snow!
Now you are got thither, and come to your resting place.

Why was there any quarrel between thee and the white Chan? +
Ye otherwise peaceful Torgots between the Yaik and the Volga,
How far ye now retreat!
Ah! the beautiful Volga (Jade) is abandoned by the Torgots;
Ah! the lovely stream of Mazak is now likewise become an orphan:
Ah! thy many excellent young princes,
Ye are now all marched far away over the Yaik.

Ah! thou well arranged troop of Torgots,
Art now perhaps arrived at the Irish (Urtsehia).
Ah! helpless lamentable time!
Thou excellent host of warriors marching towards Altai,
Ye have no princely women among you!
Face ye well, ye who bring up the rear of the horde,

Frances Aksokal and Kirep!*

+ The Czar of Russia.

Among the specimens of Calmuck poetry which Mr. Tooke has published in his valuable work on the Russian Empire, is an elegy written upon the occasion of their departure from the Volga, which we present to the curiosity of our readers.

The Calmucks, according to Mr. Tooke, are divided into three ranks; the nobility, who are called white-bones; the common people, who pay tribute, and are termed black-bones; and the clergy. The noble ladies are also called white flesh, and the common women black flesh; but pedigrees are reckoned only by the bones. The tribute consists of the tenth part of their cattle and other property. In the time of war, upon the first summons, every man must appear on horseback before the prince, who dismisses such as are unfit for service. All the subjects belonging to one prince are termed an obuss, and are divided into tians, each containing from 150 to 300 families, and commanded by a saiasan or noble. But though each obuss has its petty prince, or taish, yet they all acknowledge more or less the sovereignty of the Contaish, or Great Chan of the Calmucks, whose authority is considered as a right perfectly established and sacred, but whose interference is only admitted in affairs of general importance.

The Calmucks are distinguished from the other nations of Asia, by their peculiar habits and appearance. They are, in general, of a middle size, athletic, and well made; and the only defect which is common among them, is their having the thighs and legs somewhat bent. Their countenance is at first extremely forbidding; a large head, round face, dark olive complexion, high and prominent cheek bones, small sparkling black eyes, widely separated from each other, a flat broad nose, scarcely rising above the level of the face, and turned up, exposing to view two immense nostrils, thick and fleshy lips, exceedingly white teeth, a short chin, a thin and scanty beard, and black coarse hair, tied up in a long queue behind, are the characteristic features of a Calmuck. Frightful as this picture may appear to us, it is those who possess these characters in the highest degree, that are regarded among them as the most beautiful. Many of the women, however, have rather agreeable features, and very delicate complexions, which are set off by the fine black of their hair; and some of the higher classes among them would even be considered as beauties by Europeans. The dress of the men consists chiefly of a shirt and drawers, made of cotton, or sometimes of sheep-skin; a small round bonnet trimmed with fur, and ornamented with a tuft of silk, or horse hair of a red colour, and immensely large boots. They have also a kind of doublet made of sheep-skin, and without sleeves, which, in the northern provinces, they wear over the shirt. In summer many of them go entirely naked, except a cloth bound round their waist. A cotton shirt is the only dress of the women during the summer; and, in winter, a long cloak of sheep-skin, and a bonnet the same as that of their husbands. They wear in their ears shells and large mock pearls, of a very irregular shape. The married women have their hair braided, which falls over their shoulders on each side of the face, and fastened at the end with bits of lead or tin, while a virgin has only a single braid hanging down the middle of her back. When equipped for war, however, many of the Calmucks wear a helmet of steel, with a gilded crest, from which hangs a net-work of iron rings as low as the eyebrows in front, and falling behind over the neck and shoulders. Their bodies are protected by a coat of mail, formed of iron or steel rings netted together, which adapts itself to the shape, and yields readily to all the positions of the body. These are manu-
The Calmucks are of a social and hospitable disposition, faithful to their chiefs, exceedingly affable, and eager to oblige. They possess a vivacity and good humour, which never forsakes them, even in their most wretched state; for a Calmuck is scarcely ever seen dejected by sorrow, and is never subdued by despair. They are, however, slovenly and dirty in the extreme, completely destitute of true courage, and greatly addicted to cheating. "Within the tent," says Dr Clarke, "we found some women, though it was difficult to distinguish the sexes, so horrid and inhuman was their appearance. Two of them, covered with grease, were lousing each other; and it surprised us, that they did not continue their work, or even look up as we entered." — "The old women," continues this celebrated traveller, "were eating raw horse flesh, tearing it off from large bones, which they held in their hands. Others, squatted on the ground, were smoking, with pipes not two inches in length, much after the manner of the Laplanders." But these defects ought in some measure to be forgotten, in the many good qualities which they possess, and which render them so superior to the Mahometan Tartars. Robberies are very rare among them, except against a hostile tribe, and murder is almost unknown. They pay great respect to old age; and though of a choleric temperament, and exceedingly fierce when irritated, they live more amicably together, than could be expected from their independent and migratory manner of life. If any one receives a present of meat or drink, he divides it faithfully with his companions; and if a relation has lost his flocks or other substance, by war or accident, he is sure to be most liberally assisted. "A Calmuck, provided with a horse," says Professor Pallis, "with arms and equipage, may ramble from one place to another for three months together, without taking with him either money or provisions. Wherever he comes, he finds either distant relations or friends, to whom he is attached by the ties of hospitality, from whom he meets with the kindest reception, and is entertained in the best manner their circumstances afford. Perhaps he lodges in the first unknown cottage he finds upon his road; and scarce has he entered it, but his wants are supplied with the most affectionate cordiality. Every stranger, of whatever nation, never fails to be well received by a Calmuck; and he may depend upon having his effects in the greatest security, the moment he has put himself under the protection of his host; for to rob a guest is considered by the Calmucks as the most abominable of all crimes."

The tents of the Calmucks, which are their only habitations, and are in general use from the prince to the peasant, are all of a circular form, with a conical roof, and a hole at the top. They are constructed of cane or wood, and covered with felt, made of camel's hair or wool. Those of their chiefs are large and well furnished, having the floors covered with mats or Indian carpets, and their beds hung with rich curtains. An encampment of their principal hordes presents the appearance of a city, with regular streets, sometimes extending a mile in length; and containing numerous shops, where several of the more refined arts are practised in considerable perfection. They have artisans in copper, brass, and iron; sometimes goldsmiths, who make trinkets for their women, idols of gold and silver, and vessels for their altars; also, persons who are expert at inlaid work, enamelling, &c. "One very remarkable fact," says Dr Clarke, "and which I should hesitate in asserting, if I had not found it confirmed by the observations of other travellers," is, that from time immemorial, the Oriental tribes of Calmucks have possessed the art of making gunpowder. They boil the efflorescence of nitrat of potass in a strong ley of poplar and birch ashes, and leave it to crystalize; after which, they pound the crystals with two parts of sulphur and as much charcoal; then, wetting the mixture, they place it in a caldron over a charcoal fire, until the powder begins to granulate." Upon the breaking up of an encampment, which, in summer, is generally done every eight or ten days, in order to go in search of fresh pasture, their first care is to dispatch some of their people, to find out a proper situation for the tents of the chans, the lama, and for the huts containing the idols. The tents are then struck, and, being so made as to take to pieces and fold up in a small compass, are packed upon the backs of the camels or oxen. The camel that is loaded with the most precious furniture is decorated with bells, and marches before, the rest following one behind another. On these occasions, the women are dressed in their best clothes; and beguile the tediousness of the journey with merriment and songs.

As the riches of the Calmucks consist entirely in their flocks, it is from them they draw their whole means of subsistence. They never think of cultivating the ground, though they inhabit many extensive tracts of country, equal in climate and fertility to any in the world. Their herds roam at large over the most luxuriant pastures, which, when withered by the droughts of summer, they renew by setting fire to the old grass. Upon these occasions, the flames will sometimes extend nearly 100 leagues; and, in fifteen days, the country is again covered with verdure.

A wealthy Calmuck possesses several hundreds of cattle, sometimes thousands; but ten cows, with a bull, and eight mares, with a stallion, are considered a sufficient independence. They have very few camels, as it is rather a delicate animal, and difficult to rear; and these are confined entirely to the rich and the priests. Their horses are small, but very swift, and are capable of galloping for several hours successively without injury, or of passing a whole day without drinking. They castrate the greater part of their
male foals, and slit their nostrils, that they may breathe more freely when they run. When breaking them, they use neither saddle nor bridle. A straight girth is tied round the body, by which the Calmuck keeps himself firm in his seat, and the animal is abandoned to his fury in the open plain. Here he is allowed to run and toss himself till he is quite fatigued, when his rider urges him on with the whip, until his strength is almost gone. He is then saddled and bridled, and rode quietly about for some time, by which means he soon becomes perfectly tame. Their horned cattle are of a beautiful shape; and their sheep are the same as those which are found throughout all Great Tartary. They are exceedingly fat, with large tails, and broad prident ears; and their wool is so coarse, that it is fit for nothing but making felt. Their principal food consists in the milk and flesh of their cattle; but horse flesh is esteemed the best. They are, however, not very delicate in this respect, as they eat not only such of their cattle and horses as have died of disease, but dogs, cats, marmots, rats, and almost every kind of wild beasts; and the poor sometimes even feed upon carrion. Their favourite dish during a journey, is a piece of flesh placed under the saddle of the horse, which, by warmth and pressure, becomes a tender and palatable steak. They eat also the roots of chervil, dandelion, and several other species of wild plants, which they use both raw and boiled. Of their milk they make a fermented liquor, called koumiss; from which they distil a spirit similar to brandy, which they call rack, or racky, and of which they are remarkably fond. The koumiss is generally made of mare's milk, which is always preferred to that which comes from the cow, as it yields three times more spirit. It is prepared by mixing a sixth part of warm water with any given quantity of warm milk, which in summer must have previously stood twenty-four hours, and in winter three or four days; to this is added, a little old koumiss, by way of yeast, when the mass is agitated; and sometimes artificial heat is applied to produce the vinous fermentation. From this substance their rack is distilled; and Dr Clarke, who witnessed the process in a Calmuck camp, has given us the following account of it: "The simplicity of the operation, and of their machinery, was very characteristic of the antiquity of this chemical process. Their still was constructed of mud, or very coarse clay; and for the neck of the retort they employed a cane. The receiver of the still was entirely covered by a coating of wet clay. The brandy had already passed over. The woman who had the management of the distillery, wishing to give us a taste of the spirit, thrust a stick, with a small tuft of camel's hair at its end, through the external covering of clay; and thus collecting a small quantity of the brandy, she received it into the palm of her dirty and greasy hand, and, having tasted the liquor, presented it to our lips." This liquor is clear and weak, but the rich Calmucks increase its strength by a second distillation, and it is capable of being kept a long time in glass bottles. This people are also extremely fond of tobacco and tea; but, as the last article is very dear, and rather difficult to be obtained, the poorer classes supply its place with several kinds of wild plants, such as the seed of the sharp leaved dock, the root of wild angelica, the seed of the Tartarian maple, and a species of liquorice. Their principal amusements are hunting, wrestling, archery, and horse racing; indeed, the greater part of a Calmuck's time is spent in diversions. They are excellent horsemen, being trained to riding from their infancy. The women, however, are as expert at this exercise as the men, and manage the animal with more gracefulness and skill; for a male Calmuck on horseback, though he never loses his seat, appears as if he were intoxicated, and about to fall off every instant. So partial are they to this amusement, that even the ceremony of marriage is sometimes performed on horseback. "A girl is first mounted," says the intelligent traveller whom we have so often quoted, "who rides off at full speed. Her lover pursues; and, if he overtakes her, she becomes his wife, and the marriage is consummated upon the spot; after which she returns with him to his tent. But it sometimes happens, that the woman does not wish to marry the person by whom she is pursued, in which case she will not suffer him to overtake her; and we were assured, that no instance occurs of a Calmuck girl being thus caught, unless she has a partiality for her pursuer. If she dislikes him, she rides, to use the language of English sportsmen, 'neck or nothing,' until she has completely escaped, or until the pursuer's horse is tired out, leaving her at liberty to return, to be afterwards chased by some more favoured admirer." The Calmucks are passionately addicted to gambling, and will sometimes sit whole nights at cards, until they have lost all that they possess, even their very clothes. This game, however, is only permitted during their festivals; and at all other times is prohibited under a severe penalty. They have also chess, draughts, backgammon, and the young people amuse themselves with singing, and dancing to the balalaika, or two stringed lute. In their drinking parties, which are very frequent, and where every one brings his share of rack or koumiss, the greatest harmony and decorum prevails; and though they are generally kept up until the stock of liquor is expended, which sometimes lasts for half a day, yet they are almost never attended either with riot or intoxication.

The most common diseases to which this people are subject, are the itch and malignant fevers, which arise entirely from their gross diet and want of cleanliness; and during the heats of summer these last are sometimes very fatal. The venereal disorder, to which they give the name of the "house disease," as properly belonging only to such as dwell in houses, is not uncommon; but it chiefly prevails in those camps where their princes reside, and is not often found among the lower orders.

The religion of the Calmucks is pagan; and, were we to judge from their sacred pictures, approaches very near to the ancient mythology of Egypt and Greece. According to M. Bergman, the majority of them profess the religion of Thibet. Their priests are treated with great respect, and in all affairs of importance they are guided by their decision. They have two written characters; one of which is esteemed sacred, and is of the highest antiquity. It is only used in such writings as concern the Calmuck law.
and is read from left to right, like the languages of Europe. The other, which is used in the common concerns of life, is read from top to bottom, and the letters are placed in columns. Such of them as possess an idol, place it near the head of their bed, with small consecrated cups full of milk, or other food, set before it; and in festivals it is decorated with garlands, and perfumes are burnt in its presence."

The commerce of this people consists entirely in the exchange of their horses and cattle for corn, woollen cloths, linens, copper, pewter, kitchen utensils, knives, and spoons; and great numbers of them from the interior annually visit Astrakan for this purpose. They are allowed to traffic with China, free of all duty; but they never deal in slaves, like their neighbours the Mahometan Tartars, who often go to war with no other intention but to procure human beings for the market; and who spare neither enemies, friends, nor children, when they wish to get rid of them. The prisoners taken in war by the Calmucks are incorporated into the nation, and swell the power and revenue of the prince. See Recueil de Voyages au Nord, tom. x. p. 255. &c. CALNE, a town of England in Wiltshire, situated on the banks of the river Marlen, which supplies it with water, and gives motion to several fulling and corn mills. The town is clean and well built, and is supposed to have risen out of the ruins of a Roman colony near Studley, where several Roman coins have been found. The church dedicated to St Mary is a large building, and has a handsome square tower at the north-east end. The Presbyterians, Quakers, and Anabaptists, have each a meeting-house in this place. Under the patronage of the Marquis of Lansdowne, whose seat is at Bowood, about two miles from the town, the market-house has been greatly improved. In this place was one of the palaces of the West Saxon kings; and, from the name of Castle-street and Castle-field, it is supposed that there had formerly been a castle in the neighbourhood, though no traces of it have yet been discovered. There was also here an hospital of black canons, dedicated to St John. Broad cloth, serges, and other articles in the cloth trade, are manufactured here to a considerable extent, and are sent to every part of England by means of the Wiltsire and Berkshire canal, which runs close to the town. Calne sends two members to parliament, who are elected by its burgesses. The corporation consists of two guild stewards, who are elected every year, and an unlimited number of burgesses.

It was here that St Dunstan, archbishop of Canterbury, performed his famous miracle, in the reign of Edward the Martyr. At the great synod which had assembled to determine the controversy between the monks and the secular priests, the floor of the hall suddenly gave way, while Bishop Beornhelm was pleading for the priests; and a great number of the members were either killed or bruised by the fall, while the seat of St Dunstan alone remained firm. This artful prelate had ordered some of the beams of the floor to be sawn asunder, and had induced the king to abandon his attention of attending the synod.

On the London road, about three miles east of Calne, is the figure of a huge white horse, in a trotting attitude, which is formed by paining the turf from the side of a chalk hill. It measures about 157 feet from the head to the tail. Number of houses 755. Population in 1801, 9767, of whom 1777 were returned as employed in trade and manufactures. Population in 1811, 5062. (*)

CALUMET, an instrument in use among the Indians of North America, and universally regarded by them as the emblem of peace. It corresponds, in a great degree, to the flag of truce as employed among the nations of Europe.

In the New World, the mode of expressing by arbitrary signs, a disposition of amity towards strangers or rival tribes, is subject to considerable variations. Among the islanders of the Pacific Ocean, the usual indication of friendship, is the green branch borne aloft in the band. On the western coast of North America, the Indians approached the English, under Captain Cook, presenting as they advanced, a staff or baton curiously wrought, and surmounted with a knot of feathers. But among all the savage nations, occupying the territory beyond the northern limits of the Spanish possessions, the symbol of peace is the tobacco pipe; and it is to this instru-
ment exclusively, that the French have given the name of Calumet, and to which that name is at present very generally applied.

The calumet, or pipe of peace, is usually about four feet in length. The bowl of it is made of red marble, hollowed out with considerable art; and the stack is composed of a reed, or of some light wood, which is easily perforated. The Indians adorn this instrument in various ways. Sometimes it is marked with the figures of animals and hieroglyphical delineations; and almost universally, it has beautiful feathers attached to it, disposed in fanciful arrangements, according to the taste of the individual, or of the nation to which he belongs. And each tribe is said to decorate the calumet after a manner peculiar to itself. The instrument in question is frequently used by the savages when warriors of different nations accidentally meet; sometimes, even in the rage and tumult of a battle, it is offered and accepted, and hostilities instantly cease; and it serves with many accompanying solemnities, as an introduction to ambassadors, and as a medium of reconciliation and alliance among contiguous tribes. But in these last circumstances, namely, when ambassadors have arrived, and a treaty is about to be formed, the use of the calumet is deserving of particular notice. The strangers having appeared, and the chiefs of the nation which receives the embassy being placed, according to the degree of eminence which they have attained, an officer, belonging also to the nation which receives the embassy, and who in Europe would be styled an aid-de-camp, prepares the calumet, in order to present it to both parties, with the requisite observations. After filling the pipe with tobacco and fragrant herbs known to the Indians, the officer alludes to snatches of burning wood, either from a neighbouring cabin, or from a fire which has been lighted on purpose, and places it upon the bowl of the instrument. The smoke gradually ascends, and when the odoriferous composition included in the pipe is sufficiently kindled, the piece of burning wood is removed. Here the first part of the ceremony appears to terminate. The officer, or aid-de-camp, next points the stem of the calumet towards the heavens, and by this action he is understood to supplicate the favour of the great spirit; he then turns it downwards towards the earth, and now he is supposed to avert the malignity of the evil genii, or charm them into quiescence; and finally, stretching forth the instrument in a horizontal direction, he moves himself round till he completes a circle; and by this last observance, he is conceived to invoke the spirits which inhabit the air, the woods, and the waters, and whose concern and delight it is, as the Indians believe, to provide for the happiness of mortals. The invocation of the benignant genii seems to conclude the second part of the ceremony. For immediately, yet not without some degree of politeness, according to the fashion of the savages, the officer presents the calumet to the chief of his own tribe; putting the extremity of the reed into his mouth. The chief, having received the smoke, blows a portion of it vigorously towards the heavens, and the rest all around him upon the earth. The pipe is next introduced successively into the mouths of the ambassadors, who blow forth in the same manner; but neither they nor the chief ever touch the instrument, except with their lips. The honour of presenting the calumet is always reserved for some person of distinction. And the whole ceremony is performed in a grave and dignified way, corresponding, in this particular, to the usual manners of the Indians, which are solemn and lofty, and bearing a resemblance, in most of its aspects, to a religious institution. The treaty is now concluded; the hatchet painted red, the awful emblem of war, is buried deep in the earth; a belt of wampum, by which the articles of agreement are recorded, is delivered; and the union, thus singularly, and, as we should say, fantastically formed and established, often continues throughout many generations.

From the calumet, and the use to which it is applied, the most elegant of the Indian dances has its origin and name. It is called the calumet dance; but when it is stated that this is the most elegant of the Indian dances, nothing more is meant, than that in the exercise or entertainment alluded to, the contortions and gestures of the performers are less frightful than in any of the other dances. Like all the other dances, however, that of the calumet must be regarded as descriptive or emblematical; and its peaceful character might even be inferred from the known uses of the instrument. It appears to represent, by a series of movements, the power, and utility of the calumet. These ideas are very obviously expressed in what may be called the chief action of the piece. In this principal part, the performers are commonly two; the one armed with a club or hatchet, and the other bearing in his hand the meditative pipe, with which he defends himself against the attacks of his opponent, and with which he ultimately succeeds in reducing him to obedience. Both the performers dance all the while; and the rest of the Indians, usually seated around them, join with them in uttering and repeating that disagreeable sound which constitutes the music of the savages. The sound referred to, Mr. Carver attempts to convey to European ears, by the words “heh, heh, heh,” and it is pressed forth from the chest, apparently with much effort. The calumet dance, however, is now in use only upon rare occasions, as when ambassadors are received by the Indians, or when strangers of distinction pass through their country. See Carver’s Travels, pp. 253, 194, 201; and Long’s Travels, p. 55. (h)

CALVADOS, a department of France, which derives its name from a chain of rocks about 12 miles long, at the embouchure of the Orne, upon which a Spanish vessel of this name was dashed to pieces. This department is formed of that part of Normandy which comprehended the dioceses of Lisieux and Bayeux. It is bounded on the north by the sea, on the west by the department of La Manche, on the south by the department of the Orne, and on the east by the department of the Eure. The principal productions of this department are all kinds of grain, excellent pasturage, hemp, lint, wool, white and red honey, wax, cider of the first quality from Auge and Bayeux, fish of all kinds, shell-fish from the rocks of Calvados, white coral, woad, coal, and iron. The river Orne is navigable from Caen to the sea; the
Pouëques is navigable from Lisieux to the sea; and the Dive from St Pierre to the sea. The Seull forms at its embouchure the small harbour of Caeruelle, where the oysters of Cancale are brought to be enclosed. The principal towns are Caen, Falaise, Lisieux, Bayeux, Vire, Pont L'Eveque, each of which is the capital of a communal district. The superficies of this department is 5700 square kilometers, or 375 square leagues, of 2000 toises. The forests contain 36 or 37 hectares, about 70,000 arpens, one half of which belong to the nation. Contributions for the year 1803, 6,948,463 francs. Population 506,000. (o)

CALVARY. See Jerusalem.

CALVIN, or CAUVIN, (John,.) the celebrated reformer, was born at Noyon, in Picardy, on the 10th of July 1509. His father's name was Gerard Calvin, and his mother's Joanna Franca; persons of respectable character, but by no means in affluent circumstances. From his earliest years he lived in the family of Montmor, which was of some distinction in the country, and received there, though at his father's expense, a very liberal education. He then accompanied the children of that family to the college of La Marche, in Paris, and studied under Marturin Cordery, a man of equal probity and learning, and celebrated throughout France as a teacher of youth. Leaving the college of La Marche, he went to that of Montaign, where, under the tuition of a learned Spaniard, he made the most rapid progress in the elements of literature. Outstripping all his companions he advanced quickly from the study of the languages to dialectics and philosophy. His father having always observed in him an uncommon degree of piety and moral virtue, concluded that he should be consulting the young man's inclinations, by devoting him to the sacred office; and accordingly he procured for him (in 1521,) from the bishop of Noyon, the Chapel of la Gesirie, in that city. In 1527 he obtained the curacy of Marteville; and two years after he exchanged it for that of Pont L'Eveque. There he preached several times, though he had not received any regular ordination, nor was any farther an ecclesiastical than by simple tonsure. But it was not long till Calvin's views, as well as those of the father, completely changed with respect to the profession which he had adopted. Having acquired some correct notions of Christianity, from the instructions of his relation, Robert Olivetan, and from a careful perusal of the scriptures, he became disgusted with the superstitions of Popery, and had actually begun to withdraw himself from the Romish communion. Gerard, too, finding that to remain in the church was not the most likely way of advancing the worldly interests of his son, was perfectly willing that he should abandon the church, and betake himself to a more profitable line of life. The study of the law was fixed on as a department in which Calvin himself expected at least to enjoy greater liberty of conscience; and which his father regarded as one that would be productive to his favourite child both of opulence and fame. In pursuance of this design, he went to Orleans, where the civil law was taught by Pierre de l'Etoile, the greatest of the French civilians, and afterwards president of the parliament of Paris. There he made such great and rapid proficiency, that he very often supplied the place of the professors in their absence; and they unaniomously and gratuitously offered him, when he was leaving the university, a doctor's degree, as a just tribute to his superior talents, his great diligence, and his high attainments in legal science. Although, however, he applied chiefly to law, he did not neglect the study of theology. And so much was he respected on account of his acquaintance with that subject, that all those in Orleans who were desirous to know any thing of the pure doctrines of religion, had frequent recourse to him for information; and on these occasions they had equal reason to admire his erudition and his zeal. At this period of his life he was a remarkably severe student. So incessant and laborious was his application, that while it greatly improved his intellectual powers, and provided him with a rich fund of knowledge, it also induced that weakness in his stomach which was afterwards the source of much distress to him, and at length shortened his days. From Orleans he went to Bourges, and there prosecuted his professional studies, under Andre Alciati, one of the most noted civilians of his age. At Bourges, he contracted an intimate friendship with Melchior Wolmar, professor of Greek, a man distinguished for his personal worth, and his skill in teaching. With his assistance Calvin acquired the Greek language, a benefit which he always recollected with pleasure, and for which he afterwards testified his gratitude, by dedicating to Wolmar his Comment on the 2d Epist. to the Corinthians. Amidst all his other pursuits, Calvin still persevered in sacred study, and sometimes preached in Lignieres, a small town in Berri, with the permission and in the presence of the governor of that district. The sudden death of his father called him back to Noyon, where, however, he remained but for a short time. He went to Paris in 1533, being then 23 years of age, and wrote a commentary on Seneca's book De Clementia. It was in the title page of this work that he first took the surname of Calvin, instead of Cauvin, which it had litherto been; a circumstance which his enemies have weakly and maliciously perverted to his prejudice, and of which, if an explanation be thought necessary, a sufficient explanation may be found in the Defense de Calvin par Drélincourt. He soon became known to all the friends of true religion, among whom was one Estienne de la Forge, a celebrated merchant, who was afterwards burned for his attachment to the gospel, and of whom Calvin makes honourable mention in his Treatise against the libertines. While at Paris he formed the resolution, which he immediately carried into effect, to the unspeakable satisfaction of the reformed in that city, of abandoning every secular pursuit, and consecrating himself to the service of God. He had scarcely entered on his new course, when he was subjected to severe trial. Nicholas Cop, rector of the university of Paris, having delivered a speech which gave great offence to the Sorbonne and the parliament, was summoned to appear before them, and answer for his conduct; but by the advice of his friends, he declined compliance, and left the kingdom. Calvin, who was an intimate friend of Cop's, and known to
have furnished him with materials for the obnoxious speech, was the next object of their vengeance. Marin, the bailiff, a cruel and relentless bigot, was sent to his room in the college of Fortret, for the purpose of apprehending him; but he was fortunately from home. His papers and books, however, were seized, and as there were among them several letters from his friends, containing heretical and exceptionable matter, and alluding to those who were hostile to the Romish church, many were on the very point of being subjected to a cruel persecution. But this was prevented by the humane interposition of the Queen of Navarre, who employed her influence with the king, and employed it successfully, in favour of the reformed. This princess sent for Calvin at the same time, gave him a very favourable reception, and listened to him with interest and attention. Immediately after the interview, equally honourable to Calvin, creditable to the queen, and useful to the reformation, he retired to Saintonge, where, at the request of a friend, (Lewis de Tillet,) he wrote some short Christian Exhortations, to serve as homilies in the several parishes, and to accustom the people by degrees to search after the truth. He also paid a visit to Le Fevre d'Estaple, who had been tutor to Francis I., and had taken shelter at Nerac from the storm of persecution. This aged saint received him joyfully, and predicted that he would yet be a remarkable instrument in the hand of Providence for the restoration of true religion in France. Calvin returned to Paris in 1534. There he was to have had a conference with Servetus, who had by that time begun to propagate his heterodox opinions respecting the Trinity; but Servetus failed to appear, though Calvin attended at the time and place appointed, and did so at the imminent hazard of his life; for this year was peculiarly troublesome and dangerous to the reformed. The king, exasperated by their firmness and successes, and particularly incensed at some of their writings against the mass, which had been posted on the door of the Louvre, commanded eight of them to be burned alive; and swore that he would not spare even his own children, if they were infected with such abominable heresies. To avoid the persecution, which had thus assumed such a violent and bloody aspect, Calvin was determined to quit the kingdom, which he did, after having published a treatise, entitled Psychopannychiam, against those who maintain that the soul sleeps after it is separated from the body.

Accompanied by Lewis de Tillet, he went to Basel in Switzerland. There he studied the Hebrew language, to which he had not hitherto directed his attention; and there he first published his greatest and most celebrated work, the Institutes of the Christian Religion. He was anxious to remain for some time in obscurity; but the calumnies circulated by high authority against the cause which he had espoused, rendered this impossible, and obliged him to come forward as its public advocate and friend. Francis I. in order to apologise for his late inhumanities, and to conciliate the German princes, whose friendship he needed, and whose resentment he had reason to fear, endeavoured to persuade them that it was only Anabaptists that he had put to death, and that, therefore, he had merely attempted to crush a sect that was equally obnoxious to them and to him. Calvin's indignation was roused by this insidious conduct, and he composed his Institutes for the purpose of vindicating himself and his Protestant brethren, and of shewing unequivocally and distinctly the tenets which they held. The first edition of the Institutes (which Maimbourg and Spondaus say was written in French, but which, it is probable, was written at the same time in Latin,) was published in 1535 in 8vo, and was only the rough sketch or outline of what the author afterwards produced. The second edition appeared in 1536, at Strasburgh, in folio, and was both larger and more correct than the first. The third edition was printed at the same place in 1543, and was still more complete. A fourth edition came out also at Strasburgh, with considerable improvements. A fifth edition in 4to was printed at Geneva in 1550, corrected in many places, and having two Indexes. In 1558, both the Latin and French editions received the author's last revision. Since that period the work has gone through a vast number of editions, and has been translated into almost all the modern languages; a circumstance which alone is sufficient to demonstrate its real excellence. This work, indeed, whatever may be thought of its doctrinal merits, is, as a system of theology, entitled to much admiration. The peculiarities of the system may be condemned, though it will be found difficult to disprove them; but the learning, the scriptural knowledge, and the philosophical ability with which they are at once developed and supported, must be acknowledged by all whose minds are not the victims of religious or political prejudice. With respect to the Latinity of the Institutes, it has obtained the applause of every competent judge. In particular, the Dedication, which is addressed to Francis I., has been universally admired, both for the sentiments and language: and is one of the few prefatory pieces which are generally allowed to stand highest in this species of composition. Just when Calvin was finishing the Institutes, he heard that in many parts of Italy there were symptoms of attachment to the reformation. He therefore hastened to the Duchess de Ferrara, daughter of Louis XII., a woman of distinguished accomplishments and exemplary piety, and one to whom the Protestants looked with some confidence and expectation. Acquainted with his merits, and qualified to appreciate them, she received Calvin with distinction; and while he confirmed her in her principles, she conceived for him an esteem which she cherished ever after, and expressed in a great variety of letters. He was not, however, allowed to remain long at the court of the duchess. The Inquisition got notice of his arrival, and soon compelled him to depart. It was probably at this period that he visited Piedmont, and preached the reformation there with success, though he was afterwards banished from it by intolerance. A pillar was erected at Aost, to commemorate his arrival and his expulsion.

From Italy Calvin went to France; but the persecution which was raging there, determined him to return to Basel or Strasburgh. The direct road being rendered impassable on account of the war, he was under the necessity of going by the way of Ge
neva. On his arrival there in August 1536, he found that the reformed religion had made considerable progress, in consequence of the exertions of Farel and Viret. Having gone to pay his respects to them, Farel most earnestly entreated him to remain in that city, and to help them in the important work in which they were engaged. And when Calvin obstinately declined the invitation, Farel addressed to him a solemn warning in the name of the Almighty, declaring that God would not bless his designs, since he preferred his own repos to Jesus Christ. The solemnity of this appeal, in connection with the extraordinary incidents which had brought him to Geneva, and the prospect which he had of being in a high degree useful to a cause which he had deeply at heart, subdued Calvin into an entire acquiescence in Farel's proposal. And accordingly he accepted of the office which the consistory and magistracy had offered him, with the consent of the people, by becoming both their preacher and professor of divinity.

He was no sooner installed, than he set himself seriously and zealously to the discharge of his public duties. He composed a Formula of Christian Faith, accommodated to the Genevese, who were just emerging from the corruptions of Popery; and to this he added a Catechism, embracing the chief points of religion. In the following year, (1537,) he succeeded, with the help of Farel and Corautil, in making the senate and people openly abjure the church of Rome, and swear to a summary of doctrine and plan of discipline which he drew up for them, and which distinctly recognised the Presbyterian form of church government. Various circumstances occurred, however, to counteract his efforts, and to give him personal trouble. The Anabaptists opposed him, and laboured to overturn what he had established. But he confuted them so completely in a public disputation, that they never afterwards gave him any disturbance. A turbulent outcast from the Sorbonne, the name of Peter Caroli, also endeavoured to bring him into disrepute, by accusing him of heretical tenets respecting the Trinity. The subject was brought before the synod of Berne, which, after various discussions, found Caroli guilty of defamation. He was exposed, however, to evils of a more serious and invincible kind. Though the Genevese had agreed to the reform in religion which Calvin and his colleagues had introduced, and professed submission to the ecclesiastical authorities which had been instituted, yet a great proportion of them remained quite unchanged, in their principles and practice, and addicted as much as ever to those impurities in which they had formerly indulged. Besides this, a great deal of animosity between families and individuals had been engendered during the war of Savoy, which continued to burn, and to produce effects the most inimical to religion.

Calvin and the other ministers did every thing in their power to correct these errors. They preached against them with the greatest energy. They used all their official influence; and applied to the civil power for its interference in behalf of public morals. But these attempts only excited the resentment of those whose unworthy conduct had called for them; and the more vicious and refractory of the people now wished for nothing but to relieve themselves from the jurisdiction of such vigilant pastors. Some differences which had occurred with respect to the administration of the Lord's Supper, gave encouragement and facility to the execution of that design. Not only had Calvin and his associates refused to administer the Lord's Supper at all to the Genevese while so much immorality and strife prevailed, but they maintained opinions with respect to the celebration of this ordinance, and certain other ceremonial points, opposite to those which seem to have been received in that district of the Protestant church. The church of Geneva made use of leavened bread in the eucharist: they had removed the baptismal fonts as unnecessary appendages; and abolished all the festivals except Sunday. The churches of the canton of Berne disapproved of their practice in these particulars, and by an act made in a synod held at Lausanne, required them to change it. To this order Calvin and his brethren refused obedience. And the syndics, or chief magistrates, who were their greatest enemies, taking advantage of that fact, and making it seem as an aggravation of their other offences, assembled the people, and procured an order from the council, for the immediate expulsion of Farel and Calvin. When the sentence was communicated to Calvin, he said, "Truly, if I had served men, I would have had a poor reward, but it is well that I have served a Master who never forgets to pay his servants all that he has promised." Calvin retired to Strasburgh, where, through the influence of Bucer and others, he was appointed professor of theology, and pastor of a French church, which he modelled according to the form adopted at Geneva. Notwithstanding the harsh treatment which he had received from the Genevese, he still remembered them with affection; and this affection he displayed in writing to them several letters, full of wholesome instructions, tender remonstrances, and encouraging prospects. He was particularly successful and happy in an answer that he wrote for their use, to a letter of Cardinal Sadoleto, Bishop of Carpentia, in which that artful priest endeavoured to recall them to the Romish communion. The reply of Calvin was so able and eloquent, that he abandoned his project. While at Strasburgh, he published an excellent treatise on the Lord's Supper, produced a new edition of his Institutes, was useful in reclaiming many Anabaptists, and was appointed in 1541, by the divines of that city, to attend the diet convened to meet at Worms, and afterwards at Ratisbonne, for settling the religious differences which had arisen in Germany. He went there with Bucer; had a conference with Melancthon, who was highly pleased with him, and called him, by way of eminence, the theologian; and proved highly useful to the protestant churches, especially to those of France.

The Genevese had now repented of their unjust banishment of Calvin, and longed to enjoy again the benefits of his instruction and authority; and, after much solicitation on their part, he consented to return. His arrival, which happened in May 1540, was welcomed with the acclamations of the people, and being released from his engagements at Strasburgh, in a manner honourable both to himself and to the magistrates and inhabitants of that city,
took up his permanent residence in Geneva. The first object which engaged his attention was the reform of public morals. And for this purpose, he projected a kind of police, and procured the establishment of a tribunal called the Consistory, with power to take cognizance of all offences, and to inflict canonical punishments, even to excommunication. In cases requiring the infliction of severer penalties, it reported to the council of the city, with its own judgment on the evidence adduced. It was originally composed of laymen and ecclesiastics; and to shew Calvin's moderation with respect to church power, the number of the former was most considerable. This new institution was sanctioned by a law passed in an assembly of the whole people, who solemnly promised to conform to it for ever. It was repudiated by many as savouring too much of Roman tyranny; but there can be no doubt that its operation was attended with the most beneficial effects, and that it contributed, in a remarkable degree, to the preservation and prosperity of the republic. The labours which Calvin now performed were so various and so great, that it seems wonderful how he sustained them. He preached daily during every other week; he gave three lectures every week in theology; attended regularly the meetings of the consistory and of the pastors; met with his congregation every Friday; gave frequent instructions to the French churches, which appear to have depended almost wholly on his counsel; vindicated and defended the Reformation against its numerous enemies; composed various books of controversy; kept up a wide and extensive correspondence with the Protestants; produced works of learning and ability, intended for general edification; and did all this amidst much agitation and disquietude, occasioned by the inflexible severity with which he maintained the rights, and enforced the authority, of the consistorial tribunal. Nor was this the whole. The council in Geneva, knowing his attainments in the science of law, consulted him in all important matters. They particularly employed him in framing their edicts and laws, which were completed and approved in 1543. And, in short, he was the person to whom they applied in all their difficulties, as one whose talents, eloquence, and influence, rendered him competent to any task prescribed by the circumstances of a turbulent people, and a rising government.

The deference shewn to Calvin's opinions, and the respect paid to his personal character, were astonishing. His disapprobation of any tenet was sufficient to procure its rejection, and all who treated him ill were considered as enemies of the state. Castalius having attempted to disseminate some doctrines which Calvin abhorred, was instantly denounced as a heretic, and obliged to leave Geneva. And James Gruet, who was beheaded there in 1547, was condemned to death, not only on account of impiety and treason, but also for having spoken disrespectfully of Calvin, and endeavoured to injure his credit at the court of France.

But while Calvin was universally esteemed and respected in the reformed church, he was at the same time equally feared and hated by that church from which he had separated. Of this, a remarkable proof occurred in 1551. Being seized with a fit of ague during sermon, and obliged to quit the pulpit, the report quickly spread that he was dead. This report was heard with the highest satisfaction by the Catholics; and in Noyon, as Calvin himself has recorded, there was a solemn procession by the canons, to thank heaven for the death of that arch heretic, whom their city had been so unfortunate as to produce. Beza, by mistake, makes this incident to have happened in 1553.

For some time he had a great deal to do in the way of controversy, and wrote innumerable tracts in defence of sound doctrine. He contended with Castalius, who translated the Bible into Latin—with the Sorbonne, who had drawn up some articles of faith, to impose on the weak and timid—with Albert Piglius, a profound sophist, who had attacked the reformed church—with the Nicodemites, who secretly embraced the Protestant faith, but through fear still adhered externally to the church of Rome—with a monk at Rouen, who was reviving the seditious of Carpocrates, the Gnostic and Antinomian—with the Catholics, against the doctrine of the council of Trent—with those who believed in judicial astrology—with Lelius Socinus, author of the sect that derives its name from him—with Osiander and others, who immoderately revived the dispute respecting the Lord's Supper—and with the Anabaptists and libertines, who had revived the worst errors of antiquity. In this last case, the work which he published offended the queen of Navarre, to whom he, on that account, wrote a remonstrance, distinguished by a happy mixture of boldness and address; and he was so fortunate as to succeed in appeasing her, and in accomplishing, at least, the partial discomfiture of the sects which he had attacked. He had also a keen controversy with Jerome Bolzeec, a Carmelite friar, who impugned his peculiar doctrine of absolute predestination, and openly taught the sentiments on that subject which were afterwards maintained by Arminius. They disputed the point in church; but Calvin displayed such a superiority in argument and erudition, that, in the judgment of all present, he obtained the victory; and, according to custom, his antagonist, who, besides his difference with Calvin, was of a troublesome temper, was first cast into prison, and then banished from the city. His chief contentions, however, were with the profane and profugate part of the inhabitants of Geneva. The strictness and impartiality of that discipline which was exercised by means of the new consistory, subjected him to much odium, and false accusation. But he persevered in his purposes, and triumphed over all opposition. He had the happiness to see the Genevese church increase rapidly, and the faction of the seditious gradually subdued: And these things, together with his habitual piety, supported him under the severe trial which he met with about this period in the loss of his wife, a woman of uncommon virtue and merit.

It is said that Calvin did not confine his views on doctrine and discipline to the church of Geneva; that he formed the splendid design, and entertained the sanguine hope of making these a model for every other protestant church in Christendom; and that proposed to send forth from the little republic,
those succours and ministers that were necessary for accomplishing that important object. For that purpose, and also with the view of forwarding the general cause of the reformation, he established an academy in Geneva, which the senate founded at his desire, and in which he himself, with other divines of learning and ability, taught the sciences with much reputation and success. And so great was the fame which this seminary acquired, that it was repaired to by a crowd of students from England, Scotland, France, Italy, and Germany; and none who were anxious to make proficiency either in sacred or profane literature, thought themselves right till they had attended it a considerable time.

In 1553, Michael Servetus, a Spanish physician, who had settled at Vienne in France, and acquired a great professional character, published a work, entitled, *Restitutio Christianismi*, &c. which contained doctrines so unscriptural, that it was reprobated even by the Papists, who actually condemned him to be burnt for heresy. Besides this work, he had written one, *De Trinitatis Erroribus*; and another, *In Pudendum Commentarius*: he had also published an edition of the Bible, and addressed a letter to Pau- pín, a Genevan minister; and in all of these productions, he had departed very widely from the most generally received doctrines of Christianity. Having escaped from Vienne, and happening to come to Gene- va in his retreat to Naples, Calvin, who was well acquainted with his principles and his character, and to whom his daring impiety and presumptuous insolence had become intolerable, at length procured his apprehension and imprisonment. He was brought to trial. After various delays, he was sentenced to be burnt alive, for having "set himself in array against the Divine Majesty and the Holy Trinity;" and the dreadful sentence was executed that same day on which it was pronounced. Every candid judge and enlightened friend of toleration will acknowledge, that the conduct of Calvin in this affair cannot be vindicated or justified. It was altogether unworthy of such a man, and must be regarded as a blot in his otherwise great and good reputation. But while this is freely conceded, a similar concession cannot be made to the enemies of Calvin, with respect to that outrageous clamour which they have raised and propagated against him for his treatment of Servetus;—a clamour which seems to have arisen, not so much from a calm consideration of Calvin's real demerit, as from an unreasonable prejudice against the man, transferred from the system of doctrine which he main- tained, or from a strong feeling of hatred to intolerance, unchastened by a knowledge of the circum- stances of the case in question, and of the history of the times in which the obnoxious transaction took place.

Calvin, doubtless, went far wrong in sanctioning the punishment of Servetus; but his error was the error of his age, and of his country; and, in proof of this, a thousand facts might be adduced. Heresy in religion was universally regarded as equal- ly criminal with transgressions of civil law, and punished with the same severity. The principles of to- leration were as yet but imperfectly understood. Even those who formally recognised them, had not imbibed their genuine spirit. And the persecuting temper of Popery was intensively retained, after men had discovered its corruptions, and emancipated themselves in a great measure from its yoke. This was the case in every place where the reformation existed, and with every sect of Christians that was possessed of power. When, therefore, Calvin is repro- bated for procuring the death of a heretic, he suffers in common with all his brethren; and the condemna- tion passed upon him, is not because he acted worse than others, but because he did not surpass them in tolerance, as he did in every thing else. It should be recollected, too, that the punishment of heretics was not only permitted, but positively required, by the constitution of Geneva. And that to have al- lowed Servetus to escape, would have been an abandon- ment of that purity and zeal, by which the sub- jects of that constitution considered it to be distin- guished, and which they had often displayed in pros- ecuting with eagerness the abettors of false doc- trines. It appears, too, that the proceedings against Servetus received the approbation of almost all the most eminent ecclesiastics who then flourished. The reformed Swiss cantons were unanimous in exhorting the council of Geneva to punish the wicked man, and to put it out of his power to increase heresy. Farel, Viret, Bucer, Beza, Gcelamadius, and even the gentle Melancthon, approved of the measure. And why are not they subjected to the same censure as Calvin? The only person who was bold enough to oppose it was Castabio, whose well known grudge at Calvin, and tendency to error in other points, suffi- ciently account for this departure from the prevailing sentiment. It may be farther remarked, that Serve- tus was a heretic of a peculiar cast. He did not merely maintain Socinian doctrine, but held princi- ples and language, with respect to the nature of the Supreme Being, which amounted to blasphem, and were not far, if they were at all, removed from A- theism. This is hinted at in the terms of his sen- tence, and distinctly asserted by some writers, who were very unfriendly to Calvin. Such conduct on the part of Servetus, as it greatly exceeded the ordi- nary bounds of heresy, would be deemed at that time more than enough to justify the opinion of one who said, that "he deserved something worse than death." It should, he noticed, also, that Calvin him- self had been accused of error with respect to the Trinity; and that, had he connived at Servetus, or dealt very gently with him, the suspicions formerly entertained of his own orthodoxy, might have been revived and confirmed. And the personal feeling which, in this view, he must naturally have experi- enced, would be strengthened, by recollecting that the doctrine of Servetus, respecting the divinity of Christ, was almost universally accounted heresy, both by Papists and Protestants; and consequently, that, considering the existing laws and notions in regard to it, and the favourable opportunity which he bad of checking it, any coldness, or reluctance on his part, would have been construed into a perfect indifference to Christianity at large. It is not true, however, that Calvin shewed any undue eagerness to procure the destruction of Servetus. Much has been alleged to this purpose by his enemies; but it has no founda- tion in fact. He acted in this case, as he uniform-
but little that he had, to his relations, he gave a concise statement of his experience and his sentiments, and bore his emphatic testimony to the doctrine of salvation by grace. Having thus made his will, he was anxious once more to address the four syndics in their assembly; but on account of the state of his health, they waited upon him, when he spoke to them in the most earnest manner, expressing his gratitude for their kindness, giving them many wholesome admonitions, suggesting to them topics of comfort, and supplicating for them the blessing of heaven. He then shook hands with each of them, and bade them farewell. They departed with tears and sorrow. On the 28th of April, all the ministers of the town and neighbourhood being assembled in his room, according to his desire, he delivered to them a parting address, exhorting them to fidelity, charity, steadfastness and perseverance, and encouraging them, by mentioning the success which had attended his own labours. His ancient friend Farei, venerable for his piety and his years, came from Neuchatel to have a last interview, which was tender and affecting. After this, he devoted his few remaining days to prayer and meditation; and, on the 24th of May, he calmly and gently fell "asleep in Jesus." His death plunged the city of Geneva into the deepest affliction; for in him they lost their most illustrious citizen, their ablest pastor, their most learned teacher, and their most valuable friend. He was buried in a common cemetery, without any extraordinary parade. His funeral was attended by almost the whole inhabitants. In compliance with his own request, there was no monument erected to his memory. But his memory is enshrined in the hearts of all the friends of learning, liberty, and religion, and will descend, with unfading honour, to the latest generations. No man has perhaps ever received so many, or such high encomiums, from writers of every age, of every country, and of every denomination. Although he had his failings, which were chiefly those of a dogmatical and irritable temper, the general and just opinion of him is, that he was "a man whose extensive genius, flowing eloquence, immense learning, extraordinary penetration, indefatigable industry, and fervent piety, placed him at the head of all the reformers." Even the language of Scaliger, usually so parsonimious in praise, is scarcely too strong, when he says, that Calvin was the most exalted character that had appeared since the days of the apostles; and that, at the age of twenty-two, he was the most learned man in Europe. Such eulogiums from such men, should make those sciolists of the present day ashamed, who never mention the name of Calvin without a sneer, and who associate with it no ideas, but those of bigotry, intolerance, and fanaticism.

The works of Calvin are extremely voluminous. The most considerable part of them are his Commentaries on Sacred Scripture. These, which extend to the whole Bible, except the book of Revelation, are distinguished by piety, sound sense, clear illustration, and uncommon impartiality. Of his great work, on the *Institution of the Christian Religion*, an account has already been given. Most of his productions, indeed, are worthy of perusal. For even where the
CALVINISM.

Calvinism. subject is of a local or occasional nature, he seldom fails to edify the reader by general truths, or to please him by acute reasoning. His controversial pieces are ingenious and powerful, but frequently disfigured by intemperance and coarseness of language. His Epistles are interesting and instructive, and should be read by those who would become acquainted with the history of that period. See Bayle’s Dictionary, art. Calvin; Beza in Vit Calvin; Sennebier, Hist. litter. de Geneve; Calv. Epist.; Spon. Hist. de Geneve; Drelincourt’s Defense de Calvin; Keate’s Short Account of the Anc. Hist., Pres. Govern., and Laws of the Rom. Church; Mansa, Panegyr. de Jean Calvin; and App. to Bishop Horsey’s Sermon before the House of Lords in 1793. (r)

CALVINISM, that system of religious doctrine which was taught by John Calvin, the reformer, and by which he was distinguished from other Christian divines. This definition of the term, indeed, is by no means correct, according to the controversial language of the day. For we find, in the writings even of men who appear to be learned, and profess to be accurate, certain tenets condemned under the title of Calvinistic, of which Arminius himself declared his most decided approbation; and certain tenets brought forward under the same title, for which not a single authority can be produced from the publications of Calvin, or of any one of his disciples. Of this there is a remarkable example, in a work lately published against Calvinism, by the present Bishop of Lincoln. In that work, which was applauded by many before they had read it, and which has become the text book of all the Pelagian and merciful doctors of the church of England, the author takes it upon him to make the doctrine of justification by faith a peculiarity of Calvinism, and to assert, that the Calvinists hold men to be so corrupted and depraved, as to be "absolutely incapable of amendment!" When the most eminent dignitaries of the church are guilty of such misrepresentation, it is not to be expected, that authors of a subordinate rank can be very free from similar errors. Several reasons may be assigned for this misrepresentation. It may be owing to ignorance. It is not uncommon for controversialists, even of a superior order, to take their ideas of the subject of dispute, not from the correct and legitimate sources of information, but from those vague and distorted accounts of it, which have been adopted without inquiry, and circulated without reflection. They cannot know it by intuition; and they will not take the trouble to make themselves acquainted with it by the ordinary process of reading and investigation. Hence we find very dogmatical language held respecting the tenets of Calvin, by persons who never read a page of Calvin's works, and who either have not been able to quote him at all, or have quoted him only through the medium of others. In this way, erroneous views of Calvinism are propagated, till, according to the progress which takes place in such cases, the system loses some of its essential features, assumes other features which do not belong to it, and thus ceases to have the connection which it originally had with him from whom it derives its name. Another source of the mis-statement to which we allude is, a want of discrimination. Even those who have perused Calvin's works, that they may learn his sentiments, have failed in making the acquisition correctly, because they have not observed the necessary distinctions. The Institutes, no doubt, should be resorted to for satisfaction, with respect to Calvinism. But that work is not to be considered as the system itself, but only as containing the system. It is a treatise of a general nature, intended by its author to give a complete view of the doctrines of the reformed churches, and to vindicate these from some unfounded aspersions, thrown upon them by the adversaries of Protestantism. It exhibits, no doubt, the peculiar sentiments of Calvin; but it also exhibits sentiments which were common to all the reformers, and which, therefore, have no title to be denounced Calvinistic. Had this fact been attended to, we should not have found, as we actually find in some works of celebrity, the doctrine of justification by faith only included under the scheme of Calvin: for it has no more connection with that scheme than infant baptism, or the divinity of Christ, or the unlawfulness of image worship, or any other doctrine which is generally received among Protestants; and it has no more connection with the scheme of Calvin, than it has with the scheme of Arminius, as may be seen by reference to the works of that divine. (See Arminianism.)—

A third cause of misrepresentation in this case is, that partial assumption of Calvinism with which some very respectable divines are chargeable. They agree with Calvin in the greatest number of his peculiarities; but there are certain of these to which they have insuperable objections. Although, therefore, they are only Calvinists in part, they yet take the name absolutely, as if they were Calvinists in whole. When the shades of difference are few and slight, or when it is not to lead to any important consequences, such indefinite language may be allowed, because, in such instances, it will be harmless. But when material points are excluded, and when this goes to affect the merits and reputation of the system, a more precise nomenclature is necessary. Those who admit the doctrines of original sin and absolute election, as they were taught by Calvin, but reject his doctrines of particular redemption and final perseverance, most certainly have no right to take their distinctive appellation from him. And those who are attached to his creed, nearly or wholly, as it exists in his Institutes, will consider it as unfair and injurious, because it takes away very much from the uniformity and consistency of the scheme; and consequently, in some measure, deprives it of that claim which it otherwise has to the regard of a philosophic mind. The persons of whom we speak are assuredly not Calvinists, whatever they may be. Perhaps they may with propriety be called Semi-Calvinists. Such a designation is more consistent with truth, and it is more agreable to theological analogy. A fourth cause of misrepresentation is to be sought for in a desire to hunt down some particular doctrine, by making it to constitute a part of Calvinism. Calvinism is known to be obnoxious to many;—so obnoxious to them, indeed, that the very mention of it fills their minds with abhorrence; and every thing that stands connected with it is by this mere association brought into disrepute. If an un candid man, there—
fore, wishes to direct the prejudice of such people
against any dogma that he might otherwise find it
difficult to disprove, he has only to put upon it the
name of Calvinism, and immediately it receives a blow,
from the effects of which no argument can possibly
save it. In proof of this, we may notice the doc-
trine respecting justification, already alluded to, held
by all the leading reformers, and by the genuine Ar-
minians too, as well as by Calvin. It is much
 disliked by the Pelagians, who form a more numerous
class of divines in the present day than is commonly
imagined. And that it may be equally disliked by
all Anti-Calvinists, they continually, in defiance of
the plainest fact, and in contempt of repeated remon-
strances, represent and treat it as an essential doctrine
of Calvinism, by which means an odium is attached
to it in the estimation of hundreds, to whom it would
be quite acceptable in different circumstances. We
do not say, that Calvinism is injured by this pro-
ceeding; but whatever Calvinism is, and however it
may be esteemed, it should certainly, as a peculiar
system, be kept free from any foreign admixture;
and more especially when that admixture is violently
forced into its composition from unjustifiable motives.
And this remark is made, more for the sake of the
doctrine in question, than for Calvinism itself, be-
cause, though both may be true, the former is un-
questionably of the greatest moment; and in relation
to this, the cautionary language of Dr Horsley ought
ever to be attended to: "Take special care," said
he in his last charge; "before you aim your shafts
at Calvinism, that you know what is Calvinism, and
what is not; that in that mass of doctrine, which it
is of late become the fashion to abuse, under the
name of Calvinism, you can distinguish with certainty
between that part, which is nothing better than Cal-
vinism, and that which belongs to our common
Christianity, and the faith of the reformed churches." Calvinism has been misrepresented in another way,
by some who can scarcely be suspected of ignorance.
Determined to bring it into discredit, whatever rate,
and finding that in its genuine form it recommends
itself too much to a sound understanding, they attach
to it certain positions of which nobody can ap-
prove; hold out these as essential parts of the sys-
tem; and thus, as the one cannot well be received
without the other, furnish a pretext for rejecting the
whole. Thus they represent Calvin and Calvinists as
teaching, that man is laid under the natural neces-
sity of sinning; that he cannot resist divine grace;
that he is utterly incapable of moral exertion; and
many other things, equally repugnant to Calvinism,
to scripture, and to common sense. Instances of
this are to be found in the writings of most anti-
calvinists. And in connection with such reprehen-
sible unfairness and injustice, is the common practice
of charging upon Calvinism consequences which are
not merely disavowed by its adherents, but which are
not realized in fact, and which may, with as much
reason at least, be charged upon the several systems
of its opponents. It has been reprobed, for ex-
ample, as derogatory to the perfections and charac-
ter of God, and as injurious to the interests of prac-
tical morality among those who embrace it; and
yet it is a notorious and undeniable fact, that where-
soever the doctrine and discipline of Calvin have exist-
ed, and been allowed to operate, the people have
been remarkable for an enlightened piety, and the
strictness of their moral conduct. Indeed, one com-
mon objection urged against Calvinism by its ene-
my[, ] that it renders its votaries too pious and too
strict for this world as it is now constituted.
We have made these observations, on the supposi-
tion that the reader is in some measure acquainted
with the tenets of Calvin. In this article, it is not
our intention to enter particularly into the statement
or illustration of these tenets; but under the word
Election, we shall take the opportunity of giving
a concise and accurate view of them: and, in the
mean time, those who wish to have the fullest in-
formation on the subject, must have recourse to the
writings of Calvin, and especially his Institution of
the Christian Religion, and not to the false and su-
perficial glosses of his adversaries; which, as we have
endeavoured to shew, are unsafe guides in such an
investigation.
A history of Calvinism would be interesting and
useful; but our limits do not admit of it even in the
most succinct way in which it could, with any pro-
piety, be written. Under the article Confession of
Faith, it will be seen how far the doctrines of
that system have been received by the several com-
unities and assemblies of the Christian church. It
is to be observed, however, that many sects, who
have no public confession of faith, have adopted and
maintained most firmly the leading peculiarities of
Calvinism. (7)

CAMARAN, or Kamaran, an island in the Red
Sea, lying between Loenia and Cape Israel, on the
Arabian coast. It stretches in the direction of north
east and south west, and is about 16 miles long and
7 broad, and only two miles distant from Cape Is-
rael. Large vessels can anchor with security in a
bay on the eastern part of the island. There is a
white house or fortress, containing some soldiers and
cannon, on the west end of the island, and it fur-
nishes good water, together with goats and fish, to
any ships that touch there. This island is one of
the most fertile and agreeable in the whole Arabian Gulf. Great quantities of white coral, fish, and pearl oysters, are obtained on the coast. Salt is also made here, and a considerable number of cattle are reared. The islands carry to the coast of Arabia, the dates, sugar, and millet, which are produced on the island. N. Lat. of the northern point 15° 31' 10", N. Lat. of the southern point 15° 18', E. Long. of the centre of the island 42° 40'. See Ovington's *Voyage to Surai*, and the Chart of the Red Sea in Lord Valenta's *Travels*, vol. ii. (o)

CAMAX, a genus of plants of the class Pentandria, and order Monogynia. See BOTANY, p. 145.

CAMBAY, probably the *Camanes* of Ptolemy, is a city of Hindostan, in Guzerat, situated about a league from the gulf of the same name, upon the north bank of the river Canari, Catari, or Myhie. This city is enclosed with a strong wall, about five miles in circuit, in which there are 12 gates. The streets, which are very large, have separate gates at the entrance of each, and these are shut every night. The houses, which are well built, are chiefly of stone, brick, or marble; and the principal edifices of a public nature, are the three bazars, and four cisterns, by which the town is copiously supplied with water in dry seasons.

The sea formerly flowed to the city of Cambay, and formed a commodious harbour, but it is now fully half a league from the town, and large vessels cannot approach nearer to it than within three or four leagues. This cause, together with the violence of the tides, which move with immense velocity, and the numerous rocks in the Gulf of Cambay, have contributed to the decline of its commerce.

Cambay was formerly one of the largest and richest cities of the East. It was called the *Cairo* of the Indies, on account of the extent of its commerce, and the fertility of its soil, which produced cotton, opium, indigo, and many other valuable articles of trade; but though its commerce has suffered a great diminution, it is still very considerable. The natives of the country, particularly the Benjans, who devote themselves to commercial pursuits, and who have a perfect knowledge of precious stones, carry on a very extensive trade with Diu, Goa, Cochin, Acheen, Bantam, Batavia, Bengal, the coast of Coromandel, Persia, and the Red Sea. As the Benjans, however, were unexperienced sailors, their vessels were always managed by Dutch pilots, whom they hired at a very high rate from the Company. This city was frequented by merchant vessels from every part of the East Indies, from Mozambique, Melinda, and from the Arabian and Persian gulfs.

The principal articles exported from the country were fine cotton cloths, canvass for the sails of ships, silk stuffs of various kinds, scarfs for ladies head dresses, carpets, bed covers of silk and cotton, mattresses, indigo, saltpetre, borax, cummin, ginger, rhubarb, sugar, oil, butter, elephants teeth, and numerous precious stones, which are found in Guzerat. Great quantities of grain and fruits of different kinds were also shipped at Cambay for different parts of the East. East Long. 72° 36', North Lat. 22° 17'. (o)

CAMBOGE, CAMBOTA, CAMBOJA, CAMBRIDIA, the different names of a country in Asia, which now forms a part of the empire of Tunkin. Camboge commences a little above the 9th degree of north latitude, and terminates at the 12th. It is bounded on the east by Cochinchina and Tsiampa, Ciampa, or Champa, on the west by the kingdom of Siam, on the north by Laos, and on the south by Cochinchina. A perpendicular chain of mountains, running from north to south, separates Camboge, Lao-tho, and Laos, from Cochinchina and Tunkin; and another chain of mountains, having nearly the same direction, separates these three states from Siam and China. This chain descends as it approaches the south, and terminates at Cape Camboge, the most southern part of the empire of Tunkin. The river Camboge, called Mecon, or Maykaung, near its mouth, and by some the Japanese river, takes its origin in this country. It waters Lower Cochinchina, and after passing by its capital, it throws itself into the Chinese Sea on the south south east. This river is one of the largest and finest in the country. At a great distance from the sea, it is about two miles broad, and is always so deep that the largest vessels may navigate it about 20 miles up the country. At its embouchure, there are several sand banks and low islands, which impede the navigation, but these may be easily avoided. This river begins to inundate the country in June, and it is said to have a depth of four fathoms at its mouth. At the distance of five or six miles from the shore, the depth of the sea was seldom greater than four fathoms, and no vessel larger than a boat could approach within less than two miles of the coast.

The soil of Camboge is extremely fertile, but its cultivation has been greatly neglected. It produces abundance of corn, rice, legumes, sugar, indigo, opium, camphire, and various medicinal plants, whose names and properties are not well known, but which abound more in Camboge than in any of the adjacent states. The point of Camboge, and the whole coast stretching from it to the western branch of the river, is exceedingly low, and is covered with underwood. The articles of trade exported from this country, when it was visited by Bowyer in 1696, were Camboge gum, benjamin, cardamoms, wax, lac neckarke, cayalaca, and Japan wood; damar, buffaloes hides, deer skins, and nerves; elephant's teeth, rhinoceros's horns. A considerable quantity of gold is found in the neighbourhood of Namnoy, a village situated at the extremity of the country, a few days journey from the frontiers of Laos; and amethysts, hyacinths, rubies, topazes, and other precious stones, are found in different parts of Camboge. The following passage from Mr Bowyer's...
The inhabitants of Camboge are Chinese, Japanese, and Malays, who have intermarried with the natives. The men have long black hair, and a dark yellow complexion: they are well made, and wear a long loose robe. This robe is fastened to one foot, and is coiled round the body till it covers the whole of it up to the neck. It descends again on the other side, and leaves nothing uncovered but the feet and legs. The women, who are handsome, but not modest, wear the same dress, and are distinguished from the men by the form of their bodies, and by their having no beard. The Malay language is generally understood by all the people in this country.

In this state there are four communes which bear the name of towns. Camboge, the capital, is situated upon the river of the same name, which is navigable up to the town by large vessels, and a considerable way beyond it by vessels of a smaller size. The town consists of one street; and at a small distance are seen the ruins of an ancient city built of stone, of an architecture resembling the European. The temple of Camboge has been much admired. It stands on wooden pillars, and is of black. The foliage and reliefs are gilt; and the pavement, which is kept covered with mats, is very valuable and curious. The population of Camboge, since a part of it has been added to Cochinchina, is 1,000,000. For a very full account of the statistics, &c. of this country, we must refer the reader to the article Tunkin, which will contain a very copious account of that extensive empire. The inhabitants of Camboge are Chinese, Japanese, and Malays, who have intermarried with the natives. The men have long black hair, and a dark yellow complexion: they are well made, and wear a long loose robe. This robe is fastened to one foot, and is coiled round the body till it covers the whole of it up to the neck. It descends again on the other side, and leaves nothing uncovered but the feet and legs. The women, who are handsome, but not modest, wear the same dress, and are distinguished from the men by the form of their bodies, and by their having no beard. The Malay language is generally understood by all the people in this country.

In this state there are four communes which bear the name of towns. Camboge, the capital, is situated upon the river of the same name, which is navigable up to the town by large vessels, and a considerable way beyond it by vessels of a smaller size. The town consists of one street; and at a small distance are seen the ruins of an ancient city built of stone, of an architecture resembling the European. The temple of Camboge has been much admired. It stands on wooden pillars, and is of black. The foliage and reliefs are gilt; and the pavement, which is kept covered with mats, is very valuable and curious. The population of Camboge, since a part of it has been added to Cochinchina, is 1,000,000. For a very full account of the statistics, &c. of this country, we must refer the reader to the article Tunkin, which will contain a very copious account of that extensive empire. CAMBRAY, the Camaracum or Camaracum Nerviorum of the ancients, a city of France, and the principal place of a district in the department of the North, is situated on the banks of the Scheldt, by which it is divided into two parts. The city is large, well built, neat and clean, and everywhere exhibits the remains of wealth and prosperity. Though the town is irregular, and the suburbs mean, yet the streets are spacious, and the public buildings magnificent. The houses are all built in the Spanish fashion, with their gable ends towards the street. The place or square for arms is so large as to contain the whole garrison in order of battle; and, though irregular, it has a fine effect. The principal hotel and the Episcopal palace are superb edifices; and the pyramidal steeple of the cathedral has been much admired, though it is still inferior to the steeples at Vienna, Strasburg, and Antwerp. There are more than 600 steps from the ground to the foot of the spire, which receives no support either from carpentry or iron-work, and which appears to be as high as the rest of the building. Exclusive of the cathedral, there are two collegiate churches and eight parish churches, together with several abbeys and hospitals. Cambray is well fortified, being defended by a fort, and by a strong though ancient citadel; and, as the adjacent country may be inundated, it is reckoned one of the strongest cities of the Netherlands.

Cambray was formerly one of the most celebrated cities in Europe, for its manufacture of fine stuffs; and its commerce, favoured by the Scheldt, which is however scarcely navigable up to the town, contributed to enrich its inhabitants. Since the establishment of similar manufactures at St Quentin and Valenciennes, those of Cambray have sustained a very considerable diminution. The manufactures carried on at present (1812) in Cambray, are those of linen, cambric, lace, black soap, tapestries, hosiery; and there is also a very extensive bleaching establishment, and a refinery of salt. In the year 1779, there were manufactured at Cambray, 977 pieces of lawn 4½s wide; 77 pieces of lawn 4ths wide; 7578 pieces of cambric; 171 pieces of striped lawn; and 6 pieces of lawn wrought with gold, silver, &c.; and about 10,000 pieces of cloth were bleached during the same year. Fairs, which continue for nine days, and at which all sorts of merchandise are sold, are held on the 25th of April and the 28th of October. Population 15,600. East long. 3° 13' 41", North lat. 50° 10' 32". See Bygge's Travels, p. 55, 56; and Tynan's Almanach du Commerce, 1811, p. 755. (6)

CAMBRIA. See WALES.

CAMBRIC, one of the finest and most dense species of the cloth manufacture. The French cambric, although its importation into this country be prohibited by law, is held in the greatest estimation. Cambrics, in imitation of the French, are also manufactured in Ireland; and the encouragement of this manufacture, along with other political causes, probably induced the legislature to impose the prohibition. The cambric used, which is the measure of fineness in every species of cloth, is calculated upon a different scale from those used in the linen manufactures of this country and Ireland. The Scotch and Irish reeds are computed according to the number of splits or divisions which they contain in 37 inches, that being the measure of the Scotch reed; the Dutch reeds for Holland cloth, are reckoned by the number contained in 40 inches; and the French cambric reed by the number contained in 34 inches. In Lancashire and Cheshire, the mode of computation is entirely different; and even those counties, although contiguous, differ as much from each other as they do from the Scotch, the Dutch, and the French. The small table annexed to this article, exhibits a comparative view of the Scottish linen, with the French cambric reed, by using which, the one standard may be reduced to its nearest equivalent measure on the other at a single glance. The city of Cambray, and the adjacent districts of what were formerly denominated the French Netherlands, were formerly the seat of this manufacture. How far it has suffered by the vicissitudes of revolution and the calamities of war, we have no accurate means of ascertaining. The texture of cambric being remarkable, both for its fineness and its closeness, the excellence of the manufacture must depend in a much greater degree upon the quality of the raw material, than upon the skill or dexterity of the artisan; and rich as the soil of Ireland is acknowledged to be, this single cause presents a physical obstruction to their rivalling the French in this species of manufacture, unsurmountable by any invention which human ingenuity can devise, or by any exertion of labour which human industry can produce. Where nature has denied the requisites, industry may be misdirected and ingenuity misapplied; but the object never will or can be attained. In the operation of weaving, there is nothing particular. It is merely very fine plain cloth, of a stout fabric, and is now very successfully imitated in cotton, although the softness of the cotton fibres will render it impossible that it should ever rival the flax in that glossy smoothness for which it is chiefly admired. From these circumstances, it seems in vain to expect that the cambric manufacture can ever be attempted, with any rational probability of success, in any part of the British dominions.

**Comparative Table of Cambric, Linen, and Holland Reeds, exhibiting at one view the ratio which they bear to each other respectively.**

**Explanation.**

The measure of the cambric reed is the number of divisions contained in 34 inches; that of the linen reed in 37 inches; and that of the holland reed in 40 inches. The linen reed is therefore counted by
The finer kinds may be found by the common rule of simple proportion, as 37 is to 34, so is the linen reed to the cambric. In the bleaching and dressing of cambrics, much of their marketable appearance consists. In those bleaching grounds or fields where this branch of the business is carried on, it is necessary, in order that it may be properly done, to use a considerable variety of machinery applicable to the particular purpose, but of which the minute description does not properly belong to this article. (J.B.)

CAMBRIDGE, the seat of a celebrated university, and capital of a county of the same name, is situated on the banks of the river Cam, and is supposed to be the Graunt of the Romana. Many absurd traditions have been circulated concerning the origin of this city, which have afforded a fruitful theme of disputation to the antiquaries of the sister universities. But though much has been written upon this subject, little is yet known with any degree of certainty. Some have even referred the foundation of this university to the 375th year before the Christian era, and have not scrupled to affirm, that Anaximander and Anaxagoras were teachers of philosophy at Cambridge! Be this as it may, of the great antiquity of this city there can be no dispute. It holds a distinguished place under the name of Camelot, in the lists of the British cities given by Gildas and Nennius; and numerous traces of Roman labour and civilization point it out as a station once belonging to that people. Ancient roads diverge from this place to Ely, Havering, Ashwell, and Godmanchester; and various fragments of urns, as well as many Roman coins of Vespasian and his successors, have been found in the adjoining fields. Dr Mason, in a manuscript quoted by Mr Gough, observes, that "in a gravel-pit, near a rill of water, called the Vicar's Brook, many curious pateras of fine red earth were found, one large vase three feet long, brass lagenæ, a brass dish embossed, the handle of a sacrificing-knife, the brasses of a pugillærus, or table book, some large bones, and Roman coins, now in Trinity college."

The ancient town is supposed to have been much superior to the modern Cambridge, both in extent and population; and is said to have reached from the castle of Grantchester on the south, to the castle of Chesterton on the north, about three miles along the western bank of the river. At present, it is only about a mile in length, and half a mile in breadth, being nearly of an oval form, diminishing towards each extremity. The principal streets are; Bridge-street, which, crossing the river by a stone bridge of one arch, extends the whole length of the town, and, at its south-east end, takes the name of St An- drew's street; and Trumpington street, through which is the entrance from London, and which, near its junction with Bridge-street, is called St John's lane. These streets, however, are not uniform in breadth, but in many places are narrower and crooked; and the houses are in general old, ill-built, and crowded closely together. The best houses are in the market-place and the contiguous streets; but, though this town cannot boast of much elegance in its appearance, it possesses both convenience and neatness, and contains some of the finest buildings in the kingdom.

The church of St Sepulchre, usually called the Round Church, or, as it was originally named, "the church of the Holy Sepulchre in the Jewry," affords a curious specimen of ancient architecture, and is supposed to have been erected by the Knights Templars, or by some persons concerned with the Crusades, in the reign of Henry the First. It was built after the model of the church of the Resurrection, or Holy Sepulchre at Jerusalem, in the Saxon style of architecture; and, in its primary form, was completely round, with a peristyle in the interior, of eight circular pillars, supporting a conical roof. The semicircular arch over the west door, is ornamented with round zig-zag mouldings, which spring from Saxon capitals. It has, however, been much disfigured by subsequent alterations, and, in its present state, appears under many disadvantages. "It is evidently," says Mr Essex, a story higher than its original architect intended it should be. This alteration was made in the reign of Edward II. for the reception of bells, when the windows were also altered, the chancel added, and the ornaments about the door defaced, and partly hidden by a wooden portal."

Great St Mary's, or the University Church, which stands in the middle of the town opposite the Senate-house, is built in the Gothic style, and has a lofty tower crowned with four elegant pinnacles, but is remarkable neither for its beauty nor uniformity of architecture. It is about 120 feet long, and 68 broad, and consists of a nave, a chancel, and side aisles. Here the members of the university generally attend divine service on Sundays and holidays. A handsome gallery, raised between the nave and chancel, contains the seats of the vice-chancellor, heads of colleges, noblemen, and doctors. The proctors, masters of arts, fellow-commoners, &c. are accommodated in the lower part of the church; and the bachelors and under graduates sit in the galleries over the side aisles. This church was erected by voluntary contribution in 1478; but was not finished till more than a century afterwards, in 1608. Besides these, there are eleven other parish churches in Cambridge, but none of them are deserving of particular observation.

The most elegant buildings of this city belong to the university, consisting of twelve colleges and four halls, each of which contains apartments for the students and fellows, and has a master's lodge, a chapel, a library, a hall, and a combination-room. Before, however, we proceed to give a descrip-
tion of these buildings, we may premise, that, previous to the erection of colleges, the students lodged in hotels or inns kept by the inhabitants, and defrayed out of their own pockets all charges for maintenance and education, and it was on account of the exorbitant demands to which they were exposed from the landlords of these inns, and to relieve them from such exactions, that colleges were founded for their accommodation and support. The most ancient of them is

*St Peter's College, or Peter-House, which stands on the west side of Trumpington street, and consists of two courts, separated from each other by a cloister and gallery. This college was originally formed of two hotels, which Hugh de Balsam, sub-prorior of Ely, in 1237, purchased and appropriated to the use of the students, and afterwards endowed for the support of a master, fourteen fellows, and eight scholars. Since that time, however, its revenues have been considerably augmented by numerous benefactions, and its fellowships and scholarships proportionally increased. It is reported, that when Lady Mary Ramsey offered a very large property to this college, upon condition that its name should be changed into "Peter and Mary's," Dr. Soame, the master, replied, with rather sarcastic humour, "Peter has been too long a bachelor, to think of a female comrade in his old age;"—a dear-bought jest," says Fuller, "for so good a benefactress; for Lady Ramsey, disgruntled at his refusal, turned the stream of her benevolence into a different channel." The chapel of this college is a handsome structure, with embrauses and pinnacles; and over the altar-piece is a beautiful window of painted glass, representing the Crucifixion. In some parts it is very richly coloured, and the figures, which are copied from the famous picture of Rubens on the same subject at Antwerp, are nearly as large as life.

Clare Hall, when founded by Dr. Richard Badew, the chancellor, in 1326, was called University Hall; but having been destroyed by fire about sixteen years after, it was rebuilt under its present name by Elizabeth de Burgh, third daughter and heiress to the last Earl of Clare, who endowed it with lands for the maintenance of a master, ten fellows, and as many scholars. In 1638, however, the whole college was renewed by subscription, and is now one of the neatest and most uniform buildings in Cambridge. It is delightfully situated on the eastern bank of the Cam, and consists of one spacious court, which is entered on the east and west sides by two lofty arches. Each of its fronts are elegant; but that which looks towards the river is magnificent, being built of Ketton stone, and ornamented with two ranges of pillars, of the Tuscan and Ionic orders. The middle tier of windows is adorned with pediments, and the other two with arctritaves; and the whole is finished with a circular pediment, decorated with urns, an entablature, and handsome balustrade. The chapel, which was erected in 1703, from a classical design by Sir James Burroughs, and which cost above L.7000, is allowed to surpass, in chasteness and elegance of decoration, every building of the kind in the university. Over the altar is a beautiful alcove, in which is a fine painting of the Salutation, by Cipriani.

Pembroke Hall, which stands nearly opposite to Peter-House, on the east side of Trumpington street, was founded in 1840, by Mary, Countess of Pembroke. Her husband having been killed at a tilting-match on her wedding-day, this lady resolved to renounce the world, and to devote her immense possessions to acts of benevolence. Having accordingly obtained a charter of incorporation from Edward III., she endowed this college for a master and six fellows; but its establishment was greatly increased by succeeding benefactors, and particularly by Henry VI. who bestowed upon it the rich living of Soham and other rectories. This building contains two courts, which are separated by the hall, but they are both ancient, and make but a mean appearance. In a small detached brick building, which stands in the inner court, is contained a curious astronomical hollow sphere, presented to the college by Dr Roger Long, and invented and partly constructed by himself. It is about eighteen feet in diameter; it can conveniently accommodate above thirty persons sitting within it, and the whole can be turned round by a small winch, with the greatest facility, though its weight is above one thousand pounds. This machine, however, though the Doctor left the interest of L.200 bank annuities to keep the instrument and place in good repair, is now much damaged, and is fast falling into decay.

Corpus Christi, or Bene't College, was originally called "Corpus Christi and the Blessed Virgin Mary," from the name of two religious societies, at whose joint expense it was at first established, and received the name of St. Benedict or Bene't, merely from its vicinity to the church dedicated to that saint.
Cambridge was begun in 1344, but was not finally endowed until 1356, when it received a master, eight fellows, three bible-clerks, and six scholars. This edifice is now much decayed, and it is intended to rebuild it upon a new and elegant plan, which is already designed, and shewn for inspection. A legacy of £1000 left by Dr Thomas Herring, archbishop of Canterbury, and a still larger one by Dr Matthias Mason, master of the college, and bishop of Ely, are appropriated to that purpose. The library of this college contains a collection of very rare and valuable manuscripts, chiefly relating to ecclesiastical affairs. It was left by Archbishop Parker, with this particular restriction, that if at any time twenty-five books are missing, and cannot be found in six months, the whole devolves by rotation upon Caius College and Trinity Hall, who, however, retain them only upon the same condition. This library is consequently kept with great care, and is annually visited and examined by the masters of these colleges.

Gonville and Caius College, or, as it is usually called, Key's College, was originally founded in 1348 by Edmund Gonville, near the gardens of St Benet's; but this gentleman dying soon after it was begun, left a sum of money at the disposal of Bishop Bateman, for finishing and endowing it. The Bishop, who was then engaged with his own foundation of Trinity Hall, deferred, for a time, the completion of his friend's plan; and afterwards, having removed its site, he fixed it near his own, and endowed it with lands and tenements for a master, four fellows, and two scholars. It formerly consisted of only two courts; but, in 1557, Dr John Caius, physician to Queen Mary, built a third, and procured a charter of incorporation under its present name. He also erected an elegant gate to each court. The first, which is opposite the street, is very simple, with the inscription, "Humilitatis;" the second, in the middle of the college, is in a very fine style of architecture, and has on one side, the inscription "Virtutis;" and on the other, "Jo. Caius Posuit Sapienctiam;" the third, which leads to the senate-house, is more ornamented, exhibiting specimens of the Doric, Ionic, and Corinthian orders, and has "Honoris" inscribed upon it. In the chapel is a grand tomb, erected to the memory of Dr Caius, with the following epitaph:

**Fui Caius vivit post funera virtus.**

Trinity-Hall, as we have already observed, owed its foundation as a college, to William Bateman, bishop of Norwich, who endowed it for a master, three fellows, and two scholars, to be students in the canon and civil law, and one fellow to study divinity. This college was originally one of the hotels for the accommodation of the students. It consists of a large court, and other buildings, and is handsomely built with stone, and uniformly sashed. Among the benefactions made to Trinity Hall, is one of £25,000, left in 1747, by Dr John Andrews, for the erection of two spacious wings, which are to extend from the present building towards the river; but the appropriation of the money to this object, awaits the decease of two maiden sisters. In the chapel is a fine painting of the "Presentation in the Temple," by Stella.

King's College owes its origin to the piety and literature of Henry VI. who in 1441 instituted a small seminary for a rector and 12 fellows, which he dedicated to the Virgin Mary and St Nicholas. About two years after, he laid the foundation of the present building, and endowed it for a provost, 70 fellows and scholars, to be supplied from Eton, 8 chaplains, 6 clerks, 16 choristers and a music master, 16 officers of the foundation, 12 servitors for the senior fellows, and six poor scholars. Had this building been finished according to its original plan, it would have equalled, if not surpassed, the most splendid palaces in Europe. But its completion was delayed by the disturbances of the state, which diverted the attention of the monarch to more important concerns, and was at last prevented by his death, and the injustice of his successor. For though Henry left bequests sufficient for the complete execution of his plan, Edward IV. deprived the college of many valuable estates, from which the expence of the building was to be defrayed. As it at present stands, however, it sufficiently evinces the munificence of its founder, and its chapel displays, perhaps the most perfect specimen of Gothic architecture now remaining in Europe. This building, so justly admired by every artist for the sublimity, elegance, and ingenuity of its construction, is 316 feet in length, and 84 in breadth. On each side are eleven immense buttresses, terminating in elegant pinnacles; and on each corner is an octagonal tower, 146 ½ feet high, and crowned with a beautiful dome. Its open worked battlements also give an airiness and elegance to its appearance, and exhibits a fine contrast to the massive materials of which it is composed. The interior of the building is yet more striking, and its vast stone roof, unsupported by a single pillar, is an object of astonishment to every beholder. It is in the form of a Gothic arch, but somewhat flattened at the centre, and is divided into twelve parts, separated from each other by the eleven principal arches, which spring from the buttresses. Each division of the roof is formed of elegant groined arches of beautifully carved wood, and in the centre is suspended a massy stone, of above a ton in weight, and finely ornamented with roses and portcullises. The inside walls are also wholly covered with numerous sculptured ornaments of exquisite and almost inimitable workmanship. These chiefly represent the arms of the houses of York and Lancaster, with a vast number of crowns, roses, portcullises, and fleurs de lis. Some of the supporters, though cut in stone, display the hand of a skilful master, and equal in expression and character almost any marble sculpture. On a pannel, at the upper part of the screen which separates the anti-chapel from the choir, is a small piece of sculpture, in very bold relief, representing the Almighty hurling the rebel angels from Heaven, which is universally admired; and on the altar-piece, is a fine painting of the "Taking down from the Cross," which was presented by the Earl of Carlisle, and is supposed by some connoisseurs to be a production of
Raphael, though his Lordship purchased it on the continent as the work of Daniel de Volterra.

In addition, however, to the magnificence of the building, and the symmetry, elegance, and taste of its internal decorations, this chapel is also highly celebrated for the exquisite beauty of its painted windows. Of these there are twelve on each side, and one in the east end; the large west window being left plain, in order to introduce sufficient light into the chapel. The side windows are about 50 feet high, and are separated by munions into five lights, and are divided into an upper and lower compartment by a stone transom. Each window contains four paintings; and each painting fills two lights; and in the central light of each division is depicted an angel and a saint, exhibiting scrolls descriptive of the events represented in the other parts of the window. The subjects are all taken from scripture history; those in the upper compartments are in general selected from the Old Testament, and those underneath from correspondent circumstances in the New. For instance, in the fourth window from the east end, on the north side, the delineations on the upper division are,

**Left side.**—Elisha raising the son of the Shunamite.

**Right side.**—David returning from battle in triumph, with the head of Goliath. Women meeting him playing on their harps.

And on the lower division:

**Left side.**—Christ raising Lazarus from the dead.

**Right side.**—Christ riding in triumph to Jerusalem. Zachaeus mounted on a tree.

Thus, in the arrangement of the paintings, a particular order is observed throughout the whole. The subjects from the New Testament, on the north side, are all prior to the crucifixion of our Saviour; while those on the south side are posterior to that event; and the east window is devoted entirely to the most material circumstances immediately connected with that transaction. This window is 53 feet high and 28 wide, and is separated, by two elegant buttresses and a transom, into six compartments. Each compartment contains one subject, and is divided by munions into three lights. In the lower division, from right to left, are, “Christ exposed to the People,” “Pilate washing his Hands,” and “Christ bearing the Cross.” In the upper division, in the same order, are, “The nailing to the Cross,” “The Crucifixion,” and “The taking down from the Cross.” But it is impossible to convey by words any idea of the excellence of composition, the discrimination of character, and the beauty of colouring which distinguish these paintings. “The strong contrast, energy, and variety of character,” says a modern author; “the powerful judgment evinced in the disposition and grouping of the figures; the boldness and freedom of the pencilling, mingled with a playful wildness of execution, to which the hand of a master only could be competent; the sublimity of the designs; the richness and brilliancy of the colouring; and the vigorous and characteristic justness of expression in the different figures, may well warrant the assertion, that these admirable pieces have very rarely been paralleled, and scarcely ever exceeded.”

This college consists of two courts, one on each side of the chapel. The old court, which is situated on the north, between the schools and Clarehall, is 120 feet long, and 90 broad; but from its being very ancient, many of the apartments are small and inconvenient. The new court is nearly 200 feet square, and is formed by the chapel on the north, a provost's lodge on the east, and a magnificent edifice built of Portland stone on the west. On the south side, which is still empty, it is intended to erect a grand pile of building, which is to be separated from the street by a handsome colonnade.

**Queen's College** was founded in 1448, by Margaret of Anjou, consort of Henry VI., and was endowed for a president and four fellows. These last, however, were afterwards increased to nineteen, besides 45 scholars, by Elizabeth, queen of Edward IV., who is annually celebrated as a co-founder. It is composed of two courts, and stands upon the east bank of the river, over which is a curious wooden bridge of one arch, supported by abutments of rustic stone work.

**Catherine Hall** was founded in 1475, by Robert Woodlark, chancellor of the university, who appointed a master and three fellows, and dedicated it to St. Catherine. It consists of one large quadrangular court, open towards the street, from which it is separated by an iron pallsade, and a piece of ground planted with elms. Its west front, opposite Queen's College, is adorned with a handsome portico.

**Jesus' College** stands at the north-east end of the town, upon the site of an ancient Benedictine nunnery, which was dissolved by Henry VII., and its possessions granted to John Alcock, bishop of Ely, who, in 1497, converted it into a college for a master, six fellows, and six scholars. It has two courts, and its principal front is 160 feet in length, elegantly built and sashed, with a handsome tower gateway at the entrance. In the chapel of this college is placed the tombstone of one of the nuns. It was dug up many years since in the master's garden, which was formerly the burial-place of the nunnery. It has this inscription:

**MORIVVS. ORNATA. JACET. HIC. BONA. BERTHA.**

**ROSATA.**

It is said that a subterraneous passage is still in existence, communicating with the priory at Barnwell, the remains of which are about a mile from hence.

**Christ's College** stood formerly near Clarehall, on the side of a hotel called God's House, and was first endowed by William Bingham for 24 scholars, in 1442. It was removed to its present situation, on the north side of St. Andrew's Street, by Henry VI. who intended to increase the establishment; but was prevented by the ensuing civil wars. His maternal sister, however, Margaret, countess of Richmond, fulfilled his intentions in 1505, and endowed it for a master and 12 fellows. It consists of an old quadrangular court, and a modern building behind, which was designed by Inigo Jones. In the gardens is shown a large mulberry tree, that was planted by Milton, when a student here. The trunk is much
Cambridge decayed; but some of the scholars have endeavoured to preserve it, by covering the damaged parts with sheet lead.

St John's College owes its original endowment to the same Lady Margaret; but it was not completed till after her death, and was opened, in 1516, for a master and 31 fellows. It occupies the site of a priory of the same name, and consists of three courts, extending from St John's Street to the river. It is chiefly built of brick, and the entrance court from the street is ornamented with a magnificent portal and four towers. On the other side of the brook, which bounds the walks of this college, are the remains of an ancient and spacious building, called Pythagoras' School, or Merton Hall. Its walls are strengthened with buttresses, and supported by arches of the Saxon style; but the building is otherwise completely devoid of ornament, except one window on each side, which has a slender pillar in the centre, with a capital decorated with a round moulding.—This is supposed to have been the place where the monks of Croyland delivered their lectures. It is, however, now used as a barn.

Magdalen College is situated in Bridge Street, on the west side of the river, and was originally a priory for canons-regular, dedicated to St Giles. In the reign of Henry VIII., it was purchased by Edward, duke of Buckingham, who erected a part of the present building, and intended to have endowed it; but was prevented by his execution, and the consequent confiscation of his property. It was afterwards endowed for a master and four fellows, in 1542, by Lord Audley, chancellor of England, who obtained a grant of it from the king, and a charter of incorporation, under the name of St Mary Magdalene College. The chapel has a curious altar-piece of plaster of Paris, representing the two Mariæ at the sepulchre in alto relievo.

Trinity College occupies the site of two ancient colleges, St Michael's and King's Hall, and several hotels. It was founded and endowed by Henry VIII. in 1546, and possesses the richest revenues of any similar establishment in Cambridge. Its buildings are also very magnificent, consisting of two spacious but irregular quadrangular courts, the largest of which measures 334 feet by 325 west and east, and 257 by 256 north and south. The east entrance from the street is by a grand tower gateway, which is ornamented by a statue of Henry VIII., and a variety of carving; and the south gateway is surmounted with four lofty towers at the corners, and adorned with a fine statue of Queen Elizabeth in her robes. The chapel is built in the Gothic style, and was erected by the sister queens, Mary and Elizabeth. On the altar-piece is a fine picture of "St Michael and the Devil," by West; and on each side, an antique and curious piece of painting in perspective; the one representing our Saviour and St John the Baptist; the other, the Virgin Mary and the mother of St John. Behind the organ gallery is a statue of the immortal Newton, executed in a masterly style by Roubillac, and erected at the expense of Dr Robert Smith. The philosopher is represented in a loose gown of a master of arts, with a prism in his hands. His countenance is turned upwards, with a look of profound and abstracted meditation, and on the pedestal is the inscription, Quod genus humanum ingenio superavit. The drapery and features are extremely beautiful; and the whole figure is considered one of the finest specimens of English statuary.

There is, perhaps, no object in the University better worth a stranger's notice, than the superb library of this college. It is a spacious apartment, occupying one side of the quadrangle called Neville's Court. The coup d'œil at entering is surprisingly grand; the books are ranged on either side, and the compartments severally crowned with busts of ancient and modern authors. There are likewise busts of Newton and Bacon, both members of this college, by Roubillac, and many curious manuscripts and marbles presented to the college at different times by its members.

In the master's lodge are apartments for the chancellor and judges when they hold the assizes at Cambridge. At the installation of the Duke of Gloucester at the annual commencement in July 1811, twelve hundred persons, consisting of members of the senate, and strangers of distinction, were sumptuously entertained by his Royal Highness in the cloisters of Neville's Court.

Emanuel College occupies the site of a Dominian convent, on the north side of St Andrew's Street. It was founded in 1584, by Sir Walter Mildmay, and endowed for a master, three fellows, and four scholars. The altar-piece of the chapel is adorned with a fine painting of the "Prodigal Son," by Ammoni.

Sidney-Sussex College was originally a monastery of Franciscans, or Grey Friars, which was purchased by the executors of Frances Sidney, countess of Sussex, who had bequeathed £5000, and some other property, for the foundation of a college, consisting of a master, 10 fellows, and 20 scholars. This bequest, however, being found insufficient to defray the expense of the buildings, &c. the fellows were reduced to seven. The chapel was rebuilt about twenty years ago; and has on the altar-piece, a fine painting of the "Nativity," by Pittoni, a Venetian.

In the master's lodge is a curious original picture of Oliver Cromwell, who was educated here.

Besides the colleges mentioned above, another is about to be established, by the name of Downing College, in pursuance of the will of Sir George Downing, Bart. who bequeathed several valuable estates, in failure of the issue of Sir Jacob Downing and his three sons, for the foundation of a college within the precincts of the university of Cambridge, to be called by his own name. On the death of Sir Jacob, who survived all his children, in 1764, the validity of the original will was disputed by his lady and her relations, and was not finally settled until 1800, when the great seal was affixed to the charter for the incorporation of the new college. The establishment is to consist of a master, a professor of the laws of England, a professor of medicine, and 16 fellows.

The master, professors, and four fellows, are already appointed, and considerable progress is made in the building, under that excellent architect, William Wilkins, Esq. It is to be of the purest Doric; the principal gateway to face the entrance to the

Total number of members, 2147.

Those members, however, who are resident in the university during term, seldom exceed a thousand; and besides the fellows and scholars, there are also maintained upon the foundation about 230 inferior officers and servants.

The other buildings belonging to the university, are the senate-house, the library and schools, and the botanical garden. The senate-house, where all the public business of the university is transacted, is a superb edifice of the Corinthian order, erected in 1722, from a design of Sir James Burrell. It occupies the north side of a grand square, which has St Mary's church on the east, the library on the west, and on the south an empty space, on which it is intended to erect a building, which is to correspond exactly with the senate-house, and contain the consistory, registrar's office, &c. This structure is built of Portland stone, and is decorated with pilasters and a handsome balustrade. On the south and east entrances are elegant pediments, supported by four clustered Corinthian columns, with finely carved capitals. The interior of the building, which measures 101 feet in length, 42 in breadth, and 32 in height, is ornamented with wainscots, carvings, and galleries of Norway oak; the ceiling is enriched with stucco work, which displays considerable taste, and the floor is laid with black and white marble in alternate squares. In the centre of the apartment, on the north wall, is a statue of George I., executed by Rysbrack; and opposite is a statue of George II., by Wilton. An elegant statue of the late Duke of Somerset when young, by Rysbrack, occupies the left side of the door at the east entrance; and on the right is an emblematical figure of Alma Mater, executed by Borotta, an Italian, and presented to the university by Sir Peter Burrell. On the scroll is inscribed:

Cuncti Adsum, Meritaq. Expectant Præmia. Palmar.
“Let all be present, and expect the palm, the reward of merit.”

A statue of the late Mr Pitt, for which L.7000 were raised by private subscription, is in the hands of Nollekens, and to be placed here.

The schools surround three sides of a small court, and were erected, in 1443, at the expense of the university, assisted by liberal benefactions. On the north side is the divinity school; on the west the philosophy school; and on the south the school for law and physic. The whole quadrangle over the schools is occupied by the library, which consists of four apartments, and was erected, in 1480, at the joint charge of Rotheram, archbishop of York, and Tunstal, bishop of Durham. The new room fronting the square, which was rebuilt in 1775, has a spacious piazza, and is surrounded with a handsome balustrade and urns. In the vestibule are an antique colossal statue of Ceres, from the temple of Eleusis; the Cippus, from the tomb of Euclid, and a number of antique marbles, inscriptions, &c, which were brought from Greece by Dr E. D. Clarke, and Mr Cripps of Jesus' College. This library contains many valuable and curious manuscripts, among which is the Beza MS. of the four Gospels and Acts of the Apostles, supposed to have been written in the third or fourth century, and to be one of the oldest manuscripts extant.

The botanical garden lies at the south-east end of the town, near Bene't College, and contains nearly five acres, richly stored with all kinds of plants, arranged according to the Linnean system. An elegant green-house, above 100 feet long, has been lately erected; and also a large and handsome building for the botanical, chemical, and mineralogical lectures.

In the university of Cambridge every college is a corporate body, governed by its own statutes, but under the control of the common laws of the university. The government of the whole is vested in the senate, and certain magistrates and officers of its appointment. All doctors and masters of arts are members of this body, which is divided into two houses, denominated Regents, and Non-Regents. Masters of arts of less than five years standing, and doctors of less than two, constitute the Regent, or Upper House, which is also called the White Hood House, from its members having their hoods lined with white silk; all the rest belong to the Non-Regent, or Lower House, otherwise called the Black Hood House, from the colour of the lining of their hoods; but the public orators, and all doctors of more than two years standing, may vote in either house. A committee of the senate, called the Caput, which is chosen annually, and consists of the vice-chancellor, a doctor of each faculty, and a regent and non-regent master of arts, consider and determine what graces or bills are to be laid before the senate; and every grace must have their unanimous approbation before it can be admitted. The public officers of the university are, the
Cambridge, chancellor, who is, in general, one of the principal nobility, and possesses the sole executive authority within the limits* of the university, except in matters of felony; the high steward, whose duty is to assist the chancellor and other officers when requisite, and to hear and determine capital causes; the vice-chancellor, who is always a master of some college or hall, and upon whom the management of the university devolves in the absence of the chancellor; two proctors, who must be regent masters of arts, attend to the discipline of the bachelors and under graduates, and read the graces and register the votes in the White Hood House; two taxors, who regulate the markets; and take cognisance of weights and measures; two moderators, who superintend the exercises and disputations on philosophical questions, and also the examinations previous to conferring the degree of bachelor of arts; two scrutators, who are non-regents, and who read the graces and collect the votes in the Lower House; the public orator, who is the mouth of the senate on all public occasions, reads and writes all its letters, and presents to all honorary degrees, with an appropriate speech; and the commissary, who is assistant, or assessor, to the vice-chancellor. Here are also a registrar, three esquire bedells, and two librarians; besides a number of inferior officers, who are appointed by the vice-chancellor, and hold their offices for life.

Besides the fellows and scholars, who are maintained upon the foundations, there are two other classes of students, called Pensioners and Sizaras.—The greater pensioners, who are generally the younger sons of the nobility, or young men of fortune, have the privilege of dining at the fellows' table, and are also called Fellow Componers; while the others dine with the scholars, but both live at their own expense. The sizaras are commonly men of inferior fortune, who are assisted in procuring an expensive education, by exhibitions and other benefactions. These, however, frequently succeed by merit to the highest honours and emolument of the university; and it is from this class that most of the dignitaries of the church of England have been taken.

Several prizes, to the value of £389, 5s. are annually distributed for the encouragement of science and classical literature. Those who are open to the whole university, amount to £353, 5s.; the rest are confined to individual colleges.

Cambridge possesses several charitable institutions, among which the principal is Addenbrooke's Hospital, which is the general infirmary for the town and country. It received its name from John Addenbrooke, an eminent physician, who bequeathed, in 1719, about £4000 for its erection, and was first intended merely for the gratuitous cure of the indigent sick. Its original design, however, was changed in 1766, when it was converted into a general hospital; and since that time it has been calculated, that 700 persons have been annually admitted and relieved. The free grammar school, which was founded in 1615, in pursuance of the will of Stephen Perse, for the accommodation of 100 boys, is now so miserably mismanaged, that the school is deserted, and two or three scholars receive their lesson at the lodgings of the master. There are, however, a number of charity schools in Cambridge, which are well supported by endowments, benefactions, and voluntary subscriptions; and several alms-houses have been endowed by generous and humane individuals, for the reception of the aged and infirm poor, who are comfortably lodged and maintained.

On the site of the old castle of Cambridge, a county jail has been lately erected, from a convenient and extensive plan of the celebrated Howard. This castle was built, or, according to Fuller, "re-edified," by William the Conqueror, in order to ensure the submission of the monks of Ely, who had attempted to resist his authority. The gate-house is the only part now standing, the rest of it having been demolished in the reigns of Henry IV. and Queen Mary, and its materials appropriated to other buildings. Near it, and within the bounds of the intrenchments, is a high artificial hill, which is supposed by many to have been raised by the Britons before the Roman invasion. It commands a fine view of the town and the surrounding villages; and the prospect is terminated by Ely cathedral, which is about 17 miles distant, and can be clearly distinguished by the naked eye. The town jail, with a bridewell contiguous to it, stands on the opposite side of the town.

Cambridge, has no manufactures of any consequence, and very little business is carried on here, except what is immediately or remotely connected with the university. Its numerous shops furnish the different colleges with every necessary; and the tutors are answerable for the payment of the bills of their respective pupils. The markets are abundantly supplied, and are under the jurisdiction of the university. From its convenient situation, however, as the head of inland navigation from Lynn, it has a considerable trade in oil, iron, coals, and corn. Great quantities of butter are brought every week from Norfolk and the Isle of Ely to this city, from whence it is sent to London. What is sold in Cambridge is made up in rather a singular way, every pound being rolled out to the length of a yard, for the convenience of dividing it into small portions, called sizes, for the use of the students. It has two annual fairs: Midsummer, or Pot Fair as it is called, from the great quantity of earthen ware which is then exposed to sale, is held on a common, near Jesus' College; it commences on Midsummer day, and continues a fortnight. Sturbridge Fair begins on the 18th of September, and continues the same time. It is held in a field, about a mile from the city, and was formerly a celebrated mart of trade, and the largest fair in England. Though greatly declined, it still retains a large trade in wool, hops, leather, cheese, and iron; and two days are appropriated to the sale of horses.

Cambridge, since its first establishment as a seat of learning, has been exposed to various changes of fortune. The first school for the instruction of youth in this place, is supposed to have been instituted by Sigebert, king of East Anglia, about the year 631. It would appear, however, that in the time of Alfred, this institution no longer existed, as that prince complained, "that he could find no teachers when he
Cambridge had youth and leisure to be instructed;" and we learn from the chronicle of the Hyde-Abbey, that Edward the Elder erected "halls for the students, and chairs and seats for the doctors, at his own charge." In 1010, the town was plundered and burnt by the Danes; and in the reign of William II. it underwent a similar misfortune from Roger de Montgomery, in retaliation for some affront given him by the king, when the university was for some time abandoned. Though Henry I. in order to induce the students to return, invested the town with several valuable privileges, yet it continued in a very languid state, until Joffrid, abbot of Croyland, according to Peter Blærnsis, in his Appendix to Ingulphus, "sent to his manor of Cottenham, near Cambridge, Gilbert, his fellow monk, and professor of divinity, who, with three other monks that had followed him to England, and were well versed in philosophical theorems, and other primitive sciences, repaired daily to Cambridge, and having hired a publick-barn, made open profession of those sciences, and soon collected a great number of scholars."

Out of this little fountain, increased to a great river," continues the same author, "we see how the city of God has become enriched, and England rendered fruitful by the many masters and teachers going forth from Cambridge as from paradise." Its prosperity, however, was again checked by a dreadful fire in 1174, which destroyed most of the churches and houses, and "only stopt," says Fuller, "for want of fuel to feed its fury." During the contest between King John and his barons, the town was successively pillaged by their forces; and in 1281, some very serious disputes arose between the members of the university and the townsmen, concerning their respective rights, which terminated in open hostility. The townspeople having assembled in a tumultuous manner, committed many flagrant acts of violence against the university. They carried off its charters, records, and other papers, which they burnt in the market-place, and compelled the chancellor and other officers to renounce, under pain of death, all the privileges that had ever been granted to it, and to sign a bond, investing its entire future government in the burgesses of the town. But these daring proceedings were soon stopped by the appearance of the Bishop of Norwich, who, having entered the town with a few soldiers, restored for a time tranquillity to the city, and punished the principal offenders. The mayor was deprived of his office, the liberties of the town were forfeited, and given to the vice-chancellor; and though the corporation was afterwards restored in the reign of Henry VIII., many of its former privileges remained with the university. The animosity between the two parties, however, continued, which often burst forth in acts of hostility and commotion; and peace was not completely restored to this university until the reign of Elizabeth. About six years after her accession, this princess visited Cambridge, where she was entertained with various dramatic exhibitions, besides orations, disputations, and other academical exercises; and, at her departure, she recommended to the university, in an elegant Latin speech, "to make the result of their studies public, and lamented that her predecessors had so provided them with splendid buildings, that she was placed in the situa-

The government of the city of Cambridge is vested in the officers of the university and the corporation, the vice-chancellor being always a magistrate by virtue of his office. The corporation consists of a mayor, high steward, recorder, twelve aldermen, twenty-four common council men, four bailiffs, a town clerk, and other officers. It sends four members to parliament, two for the university, who are chosen by the senate, and two for the city, who are elected by the mayor, bailiffs, and freemen not receiving alms, amounting in all to about 200 voters. According to the census of 1801, Cambridge contained 1691 houses, and 10,087 inhabitants, of whom 1306 were returned as employed in trade and manufactures, and 811 as belonging to the university; and in 1811, the total population was 11,108. North lat. 52° 12' 36"; East long. 0° 4' 15". See Beauties of England and Wales, vol. ii. p. 21—109; Har-aden's Cantabrigia depicta, Camb. 1811; and the Cambridge Guides, Lond. 1794. (L)

CAMBRIDGESHIRE, one of the inland counties of England, is bounded on the north by Lincolnshire, on the north-west by Northamptonshire, on the west by Huntingdonshire, on the south west by Bedfordshire and Hertfordshire, on the south by Essex, on the south-east by Suffolk, and on the north-east by Norfolk.

The northern part of Cambridgeshire consists chiefly of what is called the Isle of Ely, which is a separate district, possessing a jurisdiction of its own. The greater part of this tract is fen country, intersected by innumerable channels and drains, and forming part of a very spacious level, stretching in to the counties of Norfolk, Suffolk, Lincoln, and Huntingdon. In the midst of these level marshes, the towns and villages built upon the elevated grounds rise like islands from the sea, and may be distinguished at the distance of several miles. All the low grounds which are formed by the stagnation of water from the overflowing rivers of this tract, are naturally boggy; but, by cutting drains and erecting embankments, considerable portions of it have been
The chalky lands are well fitted for the growth of beech, oak, ash, and elm.

pears to be fast spreading, and, with the introduction of some new agricultural machines, promises to become of essential service. The general rent of farms is from £300 to £350 per annum; but the rental of some in the neighbourhood of Wisbech are as high as £800, and one in the parish of Wood Ditton, is occupied at the rent of 1000 guineas yearly. The woodland are extremely small, the whole quantity of timber throughout the county scarcely amounting to 1000 acres, and these principally scattered through the parishes of Stackworth, Wood Ditton, Linton, Baw

The chief rivers in Cambridgeshire are the Ouse and the Cam. The Ouse rises in Northamptonshire, and after watering Buckinghamshire and Bedfordshire, it enters Cambridgeshire between Fenny Drayton and Erith, from which it runs eastward through the fens, till at some distance above Denny abbey it turns to the north, and passing Streatham, Ely, and Littleport, it crosses the north western part of Norfolk, and flows into the sea at Lynn Regis. The Cam, or Granta, which probably received its name from its crooked course, has three branches, the principal of which rises at Ashwell in Hertfordshire, and enters Cambridgeshire to the west of Gilden Morden. After flowing to the north-east and receiving several rivulets, it is enlarged near Granchester by the united waters of some streams which rise in the county of Essex. After this junction, it takes a northerly course, flows through the walks of the chief colleges in Cambridge, and falls into the Ouse at Harimere in the parish of Streatham.

Besides these rivers, there are numerous artificial streams in the northern part of the county for carrying off the surplus water of the fenny grounds. The principal of these drains are the old and new Bedford rivers, which are navigable for more than twenty miles from Erith to Denver. It is in contemplation to cut a canal from Clayhive, seven miles below Cambridge, to Saffron-Walden and Bishops-Stopford, in all a distance of 25 miles; by this means the inland navigation from Lynn and from Cambridge to the metropolis would be completed.

The Great Level of the Fens, which lies in the counties of Cambridge, Huntingdon, Northampton, Lincoln, Norfolk, and Suffolk, includes nearly.
CAMBRIDGESHIRE.

Cambridge shire. 400,000 acres, and appears to have been formerly firm and dry and cultivated land. Great quantities, both of the trunks and the roots of fir and oak trees, and of furze and nut bushes, standing in the solid earth, have been found at various depths in the fens; and it appears from the description of the Fenny country, given by Henry of Huntington, who lived in the time of King Stephen, and of William of Malmsbury, who lived in the first year of Henry II., that it was covered with fine wood, and was in every respect a flourishing and agreeable district. A few centuries afterwards, however, the fens were covered with water, and reduced to the state of a morass: the health of the inhabitants was destroyed by the noxious exhalations from the stagnant waters: the county was rendered impassable even to boats from the sedge, reeds, and slime with which it was covered; and the inhabitants were in danger of perishing for want of food.

As early as the reign of Edward the First, attempts were made to drain the fens; and in the subsequent reigns of Edward III., Elizabeth, Charles I., Charles II., &c. these attempts were continued with various success. In the year 1795, a bill was carried in parliament for improving the outfall of the river Ouse, and the drainage of the South and Middle Levels, by making a cut across the marshes from Eaubrink to Lynn; a plan from which very considerable advantages are expected. Great numbers of windmills have been erected for the purpose of conveying the water from the wet grounds; but in spite of all the measures which have been taken for this purpose, the crops are often carried away by inundations, and the best land overwhelmed and rendered useless. Nearly 150,000 acres of fenny ground are still in an unimproved state, and their average value scarcely exceeds four shillings per acre. The Cambridgeshire canal commences in the river Ouse, at Harri- mere, and terminates in the town of Cambridge. A cut of three miles extends to Reche, and another of three miles and a half to Burwell. The river Cam is embanked in all its lower parts above the adjoining fens. It has no locks in some parts, but it has sluices for making flushing of water to enable boats to pass the shallows.

This county is not distinguished by numerous remains of antiquity. At a short distance from the village of Chesterton are seen some vestiges of a Roman camp, called Harborough, or Arbory, of a form nearly square. Three parts of the wall which yet remain, enclose nearly six acres of ground, in which several Roman coins have been found, one of which had the head of Rome on one side, and Castor and Pollux on horseback on the reverse. On the Gog- magog hills, about four miles to the east of Cam- bridge, and the highest hills in the county, are the remains of a fort or camp, which has three ramparts and two grafts. It is nearly circular, and is about 246 paces in diameter, enclosing about thirteen acres and a half of ground. It cannot be ascertained whether this camp was the work of the Romans, Britons, or Danes; but some are of opinion that it was erected by the British as a check to that of the Romans at Harborough, which is situated directly opposite to it. A Roman highway runs southward from the brow of the hill, and points directly to Cambridge, according to Gale, or to Grauchester, according to Hursley. Several Roman coins were found here in digging a cellar in 1685. At a place beside the river, called Danhill near Trumpington, many urns, containing human bones, have been found at different times; and also several vases and paterae. Hence it has been regarded as a Roman burying place. In the year 1694, when some husbandmen were ploughing a field, they turned up several ancient coins, some large gold rings, and a thin plate of lead. One of the labourers then thrust his hand into the earth, and brought out three silver plates of a circular shape, and about six inches in diameter. The two largest were kept together by a small silver rivet passing through their centres, and on one of them were some knobs and figures, and a Danu-Saxon inscription. Excepting the three first words, which are unintelligible, the inscription, which proves it to have been a charm or amulet, may be thus translated: "O Lord, Lord, him always defend who carryeth me about with him; grant him whatever he desires." In the year 1730, when the road was making from March to Wisbech, three urns were discovered full of burnt bones and ashes, and also a pot containing 300 pieces of silver coin of all the emperors from Vespasian to Antoninus Pius. An altar, 21 inches high, was found at Ely: and at Welney, various coins have been discovered in urns. At the village of Ar- rington, the skeleton of 16 human bodies was found in 1721, in digging for a water-course, and within two feet of the surface. The bones were lying irregularly, some in heaps, and others of the parts of only one skeleton. In a burrow between Haslingfield and Comberton, was found a freestone coffin, covered with a stone inlaid of divers colours.

Cambridgeshire is about 50 miles long, about 25 miles broad at its southern and western extremity, and 120 miles in circumference. It contains 686 square miles, 437,040 square acres, about one third of which is arable, one third in pastureage, and the other third in an uncultivated state. The number of houses in 1801, is 16,139, and the population 89,346; the number of males is 44,084, and the number of females 45,265, of whom 11,983 were returned as employed in trade and manufactures. The population, according to the new returns in 1811, is 100,109. There are 160 parishes in Cambridgeshire, one city, Ely, and nine market towns, viz. Cambridge, the county town, Caxton, Linton, March, Newmarket, Sohans, Thorney, Wisbech, and part of Royston. It is divided into fifteen hundreds; sends six members to parliament, two for the county, two for the town, and two for the university. This county is the dio- cese of Ely, and in the Norfolk circuit. It pays nine parts of the land tax, and furnishes the militia with 480 men. In 1805, the total return of income under the property tax was £1,254,197. The amount of the poor rates in 1803, was £105,576 at 4s. 8d. in the pound. See the Description of England and Wales, vol. i. p. 220; the Beauties of England and Wales, by Brayley and Britton, vol. ii. p. 1; and Vancouver's General View of the Agriculture of the County of Cambridge. (o) CAMBYSES. See PERSIA.
CAMDEN, William, one of the most learned men that this country has produced, was born at London in 1551, of respectable, but not opulent parents. He received the rudiments of his education in Christ's hospital; was afterwards sent to St Paul's school; entered, at the age of fifteen, a servant at Oxford; and laid the foundation of his classical education under Dr Thomas Cooper, who was afterwards Bishop of Lincoln. By the influence of the Popish party, he was disappointed of a fellowship; and soon after went to London, where he successfully prosecuted his studies, his literary friends kindly supplying him with money and books. In 1573 he returned to Oxford, where he obtained the degree of Bachelor of Arts; and, two years afterwards, he was appointed second master of Westminster school, the duties of which office he discharged with fidelity and diligence, and rose to the rank of head-master in 1593. Notwithstanding the laborious duties of his office, he found time, while at Westminster, to collect and prepare materials for his great work *Britannia, a chorographical description of the kingdoms of England, Scotland, and Ireland, with the adjacent Islands, with an account of the origin, manners, and laws of the inhabitants from the remotest antiquity.* This learned work established his reputation as a scholar all over Europe. In 1593, he published a fourth edition of it in folio, much enlarged and improved, and embellished with valuable maps; for which he had been at great pains to collect new materials, and to avail himself of the information of his literary friends. It was, however, severely criticised, and charged with many errors, which obliged its author to revise it anew; but while he candidly acknowledged and corrected his mistakes, he also proved, from various undoubted authorities, that he had in many instances been unjustly attacked. The edition which received its finishing hand was printed in 1607. Dr Holland of Coventry having published a translation of it in 1611, in which he had inserted several articles of his own, Edmund Gibson of Oxford, afterwards Bishop of London, gave a new translation of it in 1695, free of all interpolations: but, because Holland's additions were often valuable, and because it was generally believed that he had consulted Camden himself when he met with any difficulties, Gibson preserved them, and placed them at the bottom of the page. He also added remarks of his own at the end of each county, either to confirm what Camden had advanced, or to supply his defects; with a list of the persons by whom he was furnished with his materials. This edition was published in two volumes folio in 1722, under the bishop's own inspection: but the public has been favoured with a new translation, and much improved edition, by the learned Mr Gough, who has enlarged it to nearly double the size of the preceding edition.

In 1597, Camden published a Greek Grammar, which was taught in all the public schools in the kingdom, and ran through nearly a hundred editions. In the subsequent year, he was taken from the office of schoolmaster, and promoted to the higher one of Clarenceux king at arms. In 1600, he published an account of all the monuments in Westminster Abbey, with their inscriptions; and in 1603, a collection of the ancient historians of Britain, was sent from the press at Frankfort, under his superintendence, which he had originally intended as the groundwork of a civil history of England. After the discovery of the gunpowder plot, King James, desirous to guard the reformed churches on the continent against the enemies of the Protestant religion, as well as to satisfy foreign princes of the justice of his own proceedings against the conspirators, made choice of Camden as the fittest person to draw up in Latin a narrative of that infamous plot. He executed this work with great accuracy, spirit, and elegance; and in testimony of its having received the royal sanction, it issued from the press of the king's printer. In 1615, he published in Latin his Annals of Queen Elizabeth, also under the sanction of his sovereign, and with this solemn appeal to posterity for his veracity as a historian, "I dedicate and consecrate it at the altar of truth to God, to my country, and to posterity." From the reputation of the author, this work raised great expectations, which were not disappointed. It is a valuable historical composition, although, in the opinion of many, the reign of that illustrious princess is drawn with a partial hand. The favourable reception which the first part of that work received from the public, might have determined him to proceed, had he not been sensible of the inconvenience attending the publication of a history, while the persons who had borne a distinguished part in it, or their immediate descendants, were still alive. This consideration made him resolve that the second volume should not be published till after his death, and left him at liberty to prosecute his history with that spirit of impartiality and freedom, with which he had so solemnly professed to guide his enquiries. That it might be given to the public in an entire state, he caused one copy to be deposited in the Cotton library, and another to be lodged with a friend for publication, who undertook faithfully to execute the trust committed to him. Besides the foregoing works, he wrote many valuable essays on British antiquities, at the request, and in compliance with the practice, of the learned society of antiquaries, some of which have been published by the laborious Hearne, in his collection of discourses on English antiquities; and these give reason to regret that others have been lost, which would have thrown light upon those subjects. This eminent scholar concluded his services to the republic of letters, by founding a professorship of history at Oxford, for which he may be reckoned among the chief benefactors to that university; the first professor being nominated by himself in 1629. He died the following year at his house in Kent, in the 73d year of his age; and by his will, written by himself on the last anniversary of his birth, May 2, 1623, (an anniversary which, as appears by his diary, was always spent in charitable deeds and pious meditations,) he modestly directed that he should be privately buried at whatever place he should die. But his executors did not obey his injunctions. They interred him with great pomp, in the south aisle of Westminster Abbey, opposite to the tomb of the poet Chaucer; and caused
a handsome statue of white marble to be erected to
his memory, holding in his hand a book with Britain-
nia inscribed on it.

Camden was not more distinguished by his learn-
ing than by his virtues. His character is thus sum-
med up by one of his biographers. "In his writings
he was candid and modest; in his conversation easy
and innocent; and in his whole life even and exem-
plary. When he was young, learned men were his
patrons: when he grew up, the learned were his in-
timates; and when he became old, he was the patron
of the learned; so that learning was his only study,
and learned men his only society." The high reputa-
tion which his writings acquired among foreigners,
is both honourable to himself and to his country;
and it might have been in a great measure owing to
the mildness and candour of his disposition, that few
who have been so eminent in the republic of letters,
have suffered so little from the critical censures of
cotemporary writers. That he maintained a very ex-
tensive correspondence with learned men, both at
home and abroad, appears from his letters and annals,
which have been given to the public; and such was
his reputation as a scholar, all over Europe, that it
was deemed a great omission in a foreigner to visit
England, and return without seeing Camden. See
Bibl. Brit.; Bishop Gibson's and Smith's Lives of
Camden. (A. P.)

CAMEL. a genus of quadrupeds belonging to the
order parda of Linnaeus, the principal generic and
specific characters of which we shall reserve for their
proper place, under MAMMALIA, and here confine
ourselves chiefly to the domestic uses to which this
animal is converted.

The camel is one of the larger quadrupeds, being
six or seven feet from the ground to the highest part
of the back, and it carries the head when erect about
nine feet above the plane of its position. The carcase
weighs three or four hundred pounds; but the size
and weight are far from alike in all.

Notwithstanding our familiarity with this animal,
the different species and varieties are by no means well
understood, which produces some inconsistency in a
general account of the properties it possesses. There
are two species so distinct, however, that they cannot
possibly be mistaken; the one the Bactrian or Tau-
ridan camel, having two bunches on the back, and
the other of somewhat smaller size, lighter made, and
more active, called the Arabian camel or dromedary.
It is this latter only which is most generally alluded
to under the name of camel.

Certain authors have described four, which they
conceive distinct species of camels. 1st, The Turkman
camel, which is larger, stouter, and of a darker colour
than the rest. It requires more careful feeding, is
less capable of resisting excessive heats, and of endur-
ing privations, and is more untractable. 2d, The
Arab camel, of smaller size, less hairy, and not so dark
in colour as the former, and which can endure the want
of water. 3d, The dromedary, which some think
is a high breed of the Arab camel, with a smaller
bunch, more agile, and able to travel three or four
times as far in the same time as the others. 4th, The
Taouridan or Bactrian camel, with two bunches, be-
longing to Persia, or the countries adjacent to the
Crimea, and perhaps found on the confines of China,
larger than the first, more hairy, and of different col-
lours, between deep brown and dun. It appears that
there is considerable variety in the colour of the camel,
and that the goods manufactured from its hair are
most esteemed when approaching nearest to white
or black.

One principal characteristic of the whole race is
the prominencc on its back, which is of a fleshy
or glandular consistence, but not produced by a
curve*ature of the spine. Zoologists have therefore
indulged an hypothesis, that it was not implanted
there by the hand of nature, but that it originated
from the treatment of the animal, and is now transmit-
ted in the breed as a generic character. Admitting
that climate, treatment, and accidental circumstances
can have very great influence on the structure and
disposition of animals, we cannot agree that such a
singular alteration has taken place in the conforma-
tion of the camel.

The natural abode of this animal is in the warmer
climates, and places abounding with sand, where
food is scanty, and exposure to long protracted pri-
vatrons are unavoidable; insomuch that, from the
configuration of its foot, difficulty is experienced in
treading another soil, and in the richer or more fertile
countries where attempts have been made for its na-
turalisation, it grows feeble, languishes, and dies.

The motion of the camel is unlike that of most
other animals; both the feet on the same side are
successively raised, and not alternately, like those of
the horse. Its pace is naturally slow, and when ac-
celerated, the rider experiences the most severe jolt-
ing, which it requires continued practice to endure.

Properties which are denied to the greater part
of quadrupeds are possessed by the camel, and in their
fullest extent converted to the use of mankind. It
is docile, patient of labour, and capable of abstinence
in a wonderful degree; it can endure scorching heats
with impunity; it feeds on thistles, on the stunted
shrubs and withered herbage of the desert, and can
pass successive days in total want of water; thus
seeming as if purposely devised by nature for the
most cheerless and inhospitable regions.

But these properties are improved to a great ex-
tent, by the mode in which the camel is reared.
At the earliest period, the legs are folded under the
body, in which position it is constrained to remain.
Its back is covered with a carpet, weighed down by
a quantity of stones gradually augmented: it re-
ceives a scanty portion of food: it is rarely supplied
with water; and, in this manner, is regularly brought
up in a system of privation. When the time of
trial has elapsed, and it is broke into subservience, it
kneels at the command of the master, who either
mounts it himself, or loads it with a heavy burden;
and trusting to its strength, and the privations it can
suffer, he ventures to traverse the trackless desert.

A strong camel is able to carry 1000 pounds, and
some are laden with 1500, for short journeys, or to
escape the tribute on single burdens. The usual
weight in long expeditions is, from 500 to 800 pounds,
so disposed, that half the weight hangs on each side,
and it is different according to the species employed.
Yet under such a heavy load, though care be taken
to feed a camel before the outset in proportion to the fatigue to be supported, it is afterwards sustained on an inconsiderable quantity of beans, or a few small balls of barley meal daily, thrown on the ground when it halted. Whole days, however, may elapse, without the animal tasting water, or being injured by the want of it. Travellers frequently speak of having experienced this in long marches. Tavernier occupied 63 days in crossing the great desert, and nine of these once intervened without finding water. Leo Africanus maintained, that camels could resist fifteen days complete privation of it without prejudice, a fact which receives confirmation from the recent observations of Dr Russel.

The camels of a caravan, from Busseolah to Aleppo, he observes, subsisted the like space of time without water; which was reckoned an extraordinary circumstance, and nothing of this kind was recollected by the natives. But we must not suppose, that these animals are insensible of thirst; for, after long privation, they drink with such avidity, that the quantity swallowed often proved fatal: and it is related of a caravan to Mecca, which had endured great extremities for want of water, that the camels set off at full speed, when they became sensible of its presence, and rushing furiously into a pool, drank so immoderately, that many died on the spot. It is said, that they can distinguish the presence of water at the distance of two or three miles. Notwithstanding the camel can resist such long privations, yet these have their limits, and protracted abstinence cannot fail to prove destructive. Of this a melancholy example happened in the year 1805, when a caravan, in its progress across a desert, was disappointed of finding a spring at the usual place. On this occasion no less than 1800 camels and 2000 persons perished of thirst.

Physiologists, in accounting for the peculiar property of the camel, in resisting the want of water, have supposed, that it is provided with an additional stomach of particular configuration, to retain what is imbibed. M. Danbenton, in dissecting a camel which was dead ten days, and had been carried fifty miles, found a quantity of clean insipid water in the deep cells of one of the stomachs: and it is well established, that in situations of urgent necessity, travellers have killed their camels to obtain the water contained in them. One of the Arabian historians, in recording the sufferings of Mahomet's army in an expedition against the Greeks, states that this alternative was resorted to: and, more recently, a similar fact is mentioned by Mr Bruce. Two of the camels, that would not rise after an exhausting march, were killed, and about four gallons of water of a bluish tint, vapid, and void of taste or smell, were taken from the stomach of each. Nevertheless, it does not appear that there is a particular reservoir for the purpose; and there is reason to think that the same purpose is fulfilled by the singular structure of the second stomach. Being composed of numerous cells, several inches deep, the oriifices of which are apparently susceptible of muscular contraction, it is conjectured, that when the animal drinks, it has the power of directing the water into these cells, instead of allowing its passage into the first stomach. But it will be received here when these are full; and, in this manner, a quantity of water may be kept separate from the food. From the structure of the second stomach, it neither receives food in the first instance, nor does it afterwards pass into its cavity. The orifices of the cells composing it are so constructed, as to prevent the entrance of solid food into them.

That the natural repugnance at drinking water from the stomach of an animal may be conquered it is not difficult to believe, when we are told, that, on occasions of scarcity, above an hundred guineas have been given for a single draught.

The progress of the camel is in general slow, especially when collected in numbers to compose a caravan; but its pace is regular and uniform, and constitutes no inaccurate measurement of distance over desolate regions, where there is no other guide. Travellers have frequently remarked, that the caravan then advances only between two or three miles an hour, and continues but seven or eight hours in motion; though, from extraordinary exertions, or the peculiarity of circumstances, the latter period may be considerably protracted in a day. But, from careful calculation of the time employed in long and painful journeys, two miles and a half an hour is the result. This was found in crossing the great desert, which extends 720 miles; and also in the little desert, which stretches above 450 miles between more fertile countries. It does not appear that the load of the camel materially affects its progress; and that the chief difference in that case lies in the daily duration of the march. One which carries but little in addition to the weight of its rider, travels an hour and a half or two hours longer every day in distant journeys.

But among the different species or varieties of the camel, some are endowed with uncommon speed, and emphatically called by the eastern nations camels of the wind. This, the Arabs figuratively express, 'when thou shalt meet a heire, and say to the rider, "Sa-lem Alick," ere he shall have answered thee, "Alick Salem," he will be afar off, for his swiftness is like the wind.' There are many gradations, however, in the fleetness of these animals, which are trained for the saddle only, and are invariably of the Arabian, or one bunch kind. But a camel endowed with this property is rarely found. The ancients relate, that a journey, which usually occupied 30 or 40 days, was performed in eleven, with camels of the dromedary species, when Alexander commanded Parmenio to be put to death; and Leo Africanus observes, that many dromedaries will go an hundred miles daily, for eight or ten successive days.

These assertions are fully confirmed by modern observations, from which we learn that the name of this fleet animal is mahari, el heire, or erragial, to distinguish it from dimmel, by which name the ordinary camel is known to the Arabs. Its properties are of different degrees, according to the various breeds or races, which as yet are not sufficiently illustrated; but it is evidently of smaller size and lighter make than any of the other species hitherto described. The camel which can go three days journey in one is cal-
led *talatayce*: one, called *sebays*, whose qualities are greater, can perform a journey of seven days in the same space of time, and this is the general characteristic. But there is still a third endowed with such fleetness, as to be capable of accomplishing nine days' journey in one, which is denominated *fasayce*.* This animal is so rare, that 200 common camels are given in exchange as its value. Provided with a goat-skin of water, a few dates, and some ground barley, the hardy Arab, having his loins, breast, and ears bound round to resist the percussion of the air, ventures on the swiftest excursions through the deserts, while the heric is allowed water only once in seven days. Sonnini relates an extraordinary journey by a Bedouin Arab, who travelled from Cairo to Mecca in five days, which commonly requires thirty: Mr. Jackson affirms that a *sebays* once came from Fort St. Joseph, on the river Senegal, to Mogador, which can be scarce less than 900 miles in seven days. An Arab also assured him, that he knew a youth of Mogador passionately enamoured of a beautiful young woman, whom nothing would satisfy but oranges from Morocco. Mounting his heirc at dawn, he departed and returned with the object of his mistress desires to Mogador the same night, though the distance between the two cities is an hundred miles. Probably this is the species of camel spoken of by Chardin so fleet that a horse only at full gallop can keep up with it. M. d'Obsonville observes, that he saw a stud of 200 in possession of an eastern prince which could travel thirty leagues a-day, each carrying two or three soldiers, with their warlike accoutrements: and he was told, that, on an emergency, they could double that distance without great inconvenience. These animals, however, were supported on choice and substantial food, though, in common with their kind, they were capable of enduring hunger. Thus it is satisfactorily established, that there is a particular breed or variety of the Arabian camel, of smaller size and greater speed than the common species.

Though the camel produces but one at a time, or rarely two, the care which is observed in their multiplication renders them numerous. A caravan will exhibit a thousand, nay, four or five thousand, collected together; and a single individual will be master of four or five hundred.

It is not in journeys only that the camel is of such remarkable utility to its owner: it alike constitutes the sustenance, convenience, and riches of the barbarous nomadic tribes; and it is indispensable to the luxuries of the more civilized nations. Its flesh is agreeable food; the milk is salutary and restorative; and from its hair are manufactured valuable articles of clothing.

The camel annually casts its hair in spring; and in the space of three days is as bare as a sucking pig. During that interval, the keeper is careful to tar it over, in order to preserve it against the annoyance of the flies. But the colour and abundance of hair depend entirely on the particular species of camel, and the climate which it inhabits: that of the Arabian camel is thin and whitish; that of the Bactrian camel thicker and darker coloured. From the hair a coarse kind of clothing, almost impermeable by water, is made for camel-drivers and shepherds; and the same commodity, for an analogous purpose, is used as wrappers of merchandise long exposed to wet in heavy rains. But in Persia and the Crimea more valuable manufactures are produced in narrow cloths of different colours, and fine stockings, of which white are the highest priced. It is wrought into shawls, carpets, and coverings for the tents of the Arabs. According to Pallas, the Tartar women of the plains manufacture a kind of warm, soft, and light narrow cloth from the hair of the Bactrian or Tauridan camel, preserving the natural colour. The hair of different colours is an article of export from Asia and Africa: its value is proportioned to the fineness and colour, that which is black being the dearest.

Besides being employed in carrying burdens and for the saddle, camels are trained for draught. The opulent Tartars of the Crimea convey their families from place to place in large four-wheeled wagons drawn by camels; and in some countries still farther east, they are used in dragging heavy clumsy carts.

The camel lives between forty and fifty years, but it is not unlikely that the duration of its life is dependent on the treatment which it receives. Sanguine hopes of its naturalization in the warmer European climates have hitherto been disappointed; yet if the change could be gradually accomplished in only a few degrees of latitude to each succeeding generation, there would probably be a less effectual check to its propagation.

As Mahomet the prophet himself rode a camel, it is considered a sacred animal in the East, nor will his votaries at all times admit of its being devoted to the service of Christians. They seldom eat its flesh themselves, nor so much from entertaining any scruples on the lawfulness of doing so, as from reluctance to sacrifice an animal so valuable to them; but where fanaticism prevails, selling it to Christians would be deemed profanation. After the annual pilgrimage to Mecca, the camel which carries the standard of Mahomet is ever afterwards exempt from labour, and the Mahometans even believe that it will participate in the pleasures of a future life.

Perhaps there is no animal of the same use to so large a portion of mankind as the camel; its sustenance is scarcely perceptible, its labours are unequalled, and it is besides an ample source, both of food and clothing. See Buffon *Histoire Naturelle*, vol. xi.; Russell's *History of Aleppo*, vol. ii.; Jackson's *Account of Morocco*; *D*’*Obsonville sur les Mours des Animaux*; *Pallas, Travels*, vol. ii.; *Philosophical Transactions*, 1791, 1806; *Tavernier, Voyages*, tom. i. p. 129; *Denon, Voyages dans l’Egypte*. (c)

**CAMEL**, in mechanics, the name of a machine which has been chiefly used by the Dutch, for raising or lifting ships by the buoyant power of water.

In the Zuyder Sea, opposite to the mouth of the river Y, there are two sand banks, between which is a passage called the Pampus, that permitted only small vessels to pass through: Vessels of a larger size took in the greater part of their cargo after they had passed this strait; but the sand accumulated to such a degree, that it became necessary to employ
some mechanical method of carrying the Dutch vessels over this obstruction. In 1672, large chests, filled with water, were fastened to the bottom of the vessels, and when the water was pumped out of the chests, the ships were buoyed up, and enabled to pass the shallow. This simple and ingenious contrivance was obviously the origin of the camel, which was invented by Meun's Meindertsono Bakker, a burgomaster of Amsterdam, in the years 1688 or 1690. A similar invention had been made several years before by Cornelius Meyer, a Dutch engineer, who went to Rome to clear the Tyber, and render it navigable; but it is not so complete a machine as that of Bakker, who is well entitled to be regarded as the original inventor.*

The camel, which we have represented in Plate CIX. Fig. 1, 2, and 3, consists of two similar hollow vessels, B, C, Fig. 1, constructed in such a manner that they can be applied on each side of the hull of a ship, as is represented in Fig. 3. Each of the hollow vessels B, C, are so formed as to resist the admission of water; and on the deck of each are erected a number of horizontal windlasses, d, d, d, &c. from which ropes d e f proceed through the tube d e, and being carried under the keel of the vessel, pass through similar tubes d' e', from which they are conveyed to the windlasses d' e', on the deck of the other half of the camel. When this machine is to be employed for the purpose of elevating a ship, the water is permitted to run into each half of the camel, till both the cavities are filled; the ropes d e f, &c. are then cast loose, and the ship is conducted between the two vessels B, C, and large planks are placed horizontally, so as to extend from the portholes of the ship, and rest upon the upper surface of the camel. The ropes d e f &c. are then made fast by means of the windlasses d, d', &c. till the ship is firmly united to the camel. The water is next pumped from the cavities of the camel, by means of the pumps g, g, till the buoyancy of the hollow vessels raises the ship from the sand, and enables it to surmount the obstruction. The length MN of the camel is generally about 127 feet, the breadth OP, of the one end 22 feet, and the breadth QR, at the other, 13 feet. The hollow part of the vessels B, C, is divided into several compartments. An East India ship that draws 15 feet of water, was so much elevated by means of this machine, that it drew only 11, and the largest ships of war in the Dutch service, from 90 to 100 guns, were always enabled to surmount the different sand-banks of the Zuyder Zee. These machines have been likewise used at Venice, and in Russia. For further information on this subject, see L'Art de ha¡ir les vaisseaux, Amsterdam, 1719; Leupold's Theatrum Machinarium, tom. viii. § 180, p. 96, tab. 24; Wright's Travels; Muschenbroek's Introduit, ad Philes. Natur. vol. ii. p. 521. The engraving of the camel in Plate CIX. is, we believe, the first that has been given in any English work. (π)

CAMELINA, a genus of plants of the class Tridynamia, and order Siliculose. See Botany, p. 264.

CAMELLIA, a genus of plants of the class Monadelfia, and order Polyandra. See Botany, p. 271.

CAMELOPARD. See Mammalia.

CAMEO, is the name given to stones of different colours, which contain sculptures in alto or basso relievo. The effect of nature is here combined with art, and the moderns have in vain attempted to imitate these relics of antiquity.

The onyx is a hard semipellucid stone, formed of several zones or strata of different colours, closely united, and throughout blended together. As the colours are more distinct and opposite, the greater value is put upon the stone. Some species exhibit three colours, and in others only two are seen, of which the upper is of a beautiful white, on a ground of deep gray.

These two species of stone were selected by the ancients for engravings or sculptures in alto and basso relievo, as the colours would admit, or according to the choice of the artist, and the subjects represented were some of the most noted incidents in antiquity, such as the labours of Hercules, the rape of Proserpine, or the annunciation to Achilles of the death of Patroclus. But one chief excellence consists in the ground being absolutely opposite and distinct from the colour of the subject. Thus, a white figure appears in high relief, though the ground be of a deep shade, or even black; and the judicious arrangement of the parts, where uniformity of colour is required, most eminently displays the skill of the artist.

Genuine cameos always bear a high value, proportioned to the beauty of the execution and the quality of the stone. They are discovered in various countries, both in the natural state, and preserved from former times. Of late years, some very exquisitely finished have been recovered by Europeans who visited Delhi.

Though the moderns have been unsuccessful in sculpturing cameos, they have produced beautiful specimens of analogous workmanship in shells. There, the interesting events of ancient history are in like manner chosen, and the relief is pure white, while the ground is blue. This invention is said to be Sicilian origin.

Another method of imitating the cameos of the ancients has been practised with very great success. Pieces of coloured glass are put into a crucible, alternating with layers of chalk or Spanish white. The crucible is then placed on a fire, the heat of which increases gradually for three hours, till it becomes very intense. The pieces of glass then turn opaque without losing the original colour, and those pieces which have no colour at all will become milk white like porcelain. If the heat has been well regulated, and not raised too high, these opaque pieces of coloured glass may be soldered to one another, so as to imitate the differently coloured layers of the onyx. The coloured glass which is found in ancient churches,
are sometimes only penetrated by the colour, through half their thickness; so that when pieces of it are rendered opaque by the preceding process, the transparent part of it that was not penetrated by the colour becomes white, and two differently coloured layers are thus obtained, without the process of soldering. The white part of the glass is then ground down to the requisite thickness, and the figures are cut upon it either in alto or basso relievo by the common process.

If the subject to be engraved is only a simple head, it may be first cut out, and then fixed upon a piece of glass of a different colour. The head is first attached with gum to the piece of glass, and after the adhesion is sufficiently firm, the surface of the glass containing the head is laid upon a bed of tripoli, and pressed upon it as if a good impression of the head were required. The glass and the head are allowed to rest upon the tripoli till it is quite dry, and as soon as this happens, the whole is placed into a furnace and exposed to an intense heat. The gum is then burnt off, and the head is soldered to the piece of coloured glass upon which it was placed. The hair of the figure may be afterwards coloured, by using a little of the solution of silver in the spirit of niter, and again exposing the head to a proper heat. For further information on this subject, see *Essais sur L’Art des anciens, de joindre par le fusion deux especes de verre, pour le gravure en relief* by M. Gerhardt, Conseiller Privé des Finances au département des mines du Roi de Prusse. (π)

**Camera Lucida**, the name of an instrument for enabling those who have no knowledge of the art of drawing, to take sketches either of natural or artificial objects. This ingenious and useful contrivance was invented in the year 1807, by W. H. Wollaston, M. D. Sec. R. S., a philosopher to whom science is indebted for numerous inventions and discoveries. As this instrument is of extensive use, its ingenious inventor has very properly secured the exclusive sale of it by patent. The description which Dr Wollaston has given of the Camera lucida is so short and perspicuous, that we shall make no apology for giving it in his own words. — We shall then conclude the article with an account of an instrument founded on the same principle.

"While I look directly down at a sheet of paper on my table, if I hold between my eye and the paper a piece of plain glass, inclined from me downwards at an angle of 45°, I see by reflection the view that is before me, in the same direction that I see my paper through the glass. I might then take a sketch of it; but the position of the object would be reversed.

To obtain a direct view, it is necessary to have two reflections. The transparent glass must for this purpose be inclined to the perpendicular line of sight only the half of 45°, that it may reflect the view a second time from a piece of looking glass placed beneath it, and inclined upwards at an equal angle. The objects now appear as if seen through the paper in the same place as before; but they are direct instead of being inverted, and they may be discerned in this manner sufficiently well for determining the principal positions.

The pencil, however, and any object which it is to trace, cannot both be seen distinctly in the same state of the eye, on account of the difference of their distances, and the efforts of successive adaptation of the eye to one or to the other, would become painful if frequently repeated. In order to remedy this inconvenience, the paper and pencil may be viewed through a convex lens of such a focus, as to require no more effort than is necessary for seeing the distant objects distinctly. These will then appear to correspond with the paper in distance as well as direction, and may be drawn with facility, and with any desired degree of precision.

**This arrangement of glasses will probably be best understood from inspection of Plate CIX.**

*a b* is the transparent glass; *b c* the lower reflector; *b d* a convex lens (of twelve inches focus); *e* the position of the eye; and *f g h e* the course of the rays.

In some cases a different construction will be preferable. Those eyes, which without assistance are adapted to seeing near objects alone, will not admit the use of a convex glass; but will, on the contrary, require one that is concave to be placed in front, to render the distant objects distinct. The frame for a glass of this construction is represented at *i k*, Fig. 6, turning upon the same hinge at *h* with a convex glass in the frame *lm*, and moving in such a manner, that either of the glasses may be turned alone into its place, as may be necessary to suit an eye that is long or short sighted. Those persons, however, whose sight is nearly perfect, may at pleasure use either of the glasses.

The instrument represented in that figure differs moreover in other respects from the foregoing, which I have chosen to describe first, because the action of the reflectors there employed would be more generally understood. But those who are conversant with the science of optics, will perceive the advantage that may be derived in this instance from prismatic reflection; for when a ray of light has entered a solid piece of glass, and falls from within upon any surface, at an inclination of only twenty-two or twenty-three degrees, as above supposed, the refractive power of the glass is such as to suffer none of that light to pass out, and the surface becomes in this case the most brilliant reflector that can be employed.

**Fig 5.** represents the section of a solid prismatic piece of glass, within which both the reflections requisite are effected at the surfaces *a b, b c*, in such a manner that the ray *f g*, after being reflected first at *g*, and again at *h*, arrives at the eye in a direction *h e* at right angles to *f g*.

There is another circumstance in this construction necessary to be attended to, and which remains to be explained. Where the reflection was produced by a piece of plain glass, it is obvious that any objects behind the glass (if sufficiently illuminated) might be seen through the glass as well as the reflected image. But when the prismatic reflector is employed, since no light can be transmitted directly through it, the eye must be so placed that only a part of its pupil may be intercepted by the edge of the prism, as at *c*, Fig. 5. The distant objects will then be seen by
In order to avoid the inconvenience that might arise from an unintentional motion of the eye, the relative quantities of light to be received from the object, and from the paper, are regulated by a small hole in a piece of brass, which, by moving on a centre at c, Fig. 6, is capable of adjustment to every inequality of light that is likely to occur.

Since the size of the whole instrument, from being so near the eye, does not require to be large, I have, on many accounts, preferred the smallest size that could be executed with correctness, and have had it constructed on such a scale, that the lenses are only 3ths of an inch in diameter.

Though the original design and principal use of this instrument is to facilitate the delineation of objects in true perspective, yet this is by no means the sole purpose to which it is adapted; for the same arrangement of reflectors may be employed with equal advantage for copying what has been already drawn, and may thus assist a learner in acquiring at least a correct outline of any subject.

For this purpose, the drawing to be copied should be placed as nearly as may be at the same distance before the instrument that the paper is beneath the eye-hole; for in that case the size will be the same, and no lens will be necessary, either to the object or to the pencil.

By a proper use of the same instrument, every purpose of the pentagraph may also be answered, as a painting may be reduced in any proportion required, by placing it at a distance in due proportion greater than that of the paper from the instrument. In this case a lens becomes requisite for enabling the eye to see at two unequal distances with equal distinctness; and in order that one lens may suit for all these purposes, there is an advantage in carrying the height of the stand according to the proportion in which the reduction is to be effected.

The principles on which the height of the stem is adjusted will be readily understood by those who are accustomed to optical considerations. For as in taking a perspective view, the rays from the paper are rendered parallel, by placing a lens at the distance of its principal focus from the paper, because the rays received from the distant objects are parallel; so also when the object seen by reflection is at so short a distance that the rays received from it are, in a certain degree, divergent, the rays from the paper should be made to have the same degree of divergency, in order that the paper may be seen distinctly by the same eye; and for this purpose, the lens must be placed at a distance less than its principal focus. The stem of the instrument is accordingly marked at certain distances, to which the conjugate foci are in the several proportions of 2, 3, 4, &c. to 1, so that distinct vision may be obtained in all cases, by placing the painting proportionally more distant.

By transposing the convex lens to the front of the instrument, and reversing the proportional distances, the artist might also enlarge his smaller sketches with every desirable degree of correctness, and the naturalist might delineate minute objects in any degree magnified.

Since the primary intention of this instrument is already, in some measure, answered by the camera obscura, a comparison will naturally be made between them.

The objections to the camera obscura are,

1st, That it is too large to be carried about with convenience.

2dly, In the former, all objects that are not situated near the centre of view, are more or less distorted.

In this, there is no distortion; so that every line, even the most remote from the centre of view, is as strait as those through the centre.

3dly, In that the field of view does not extend beyond 50°, or at most 55° with distinctness.

But in the camera lucida as much as 70° or 80° might be included in one view.

It is obvious, that the preceding contrivance may be applied to a telescope, for the purpose of taking sketches of the different objects that may be contained within the field of view; but as it is only a small portion of a landscape, or of any large object, that can be seen at once through a telescope, it would be desirable to have some contrivance by which the objects seen in different fields of view, and sketched upon the same piece of paper, might be all connected with each other into one landscape. This, however, can be done only to a certain extent, as will appear from Plate CIX. Fig. 7.

Let AB be the direction of the telescope, which, when placed upon a suitable stand, can be moved round the axis O in a horizontal plane, B b b'; B, the extremity of the eye-tube at which the prism of the camera lucida is fixed; MN, the paper, lying in a horizontal position; and a b, a' b', successive positions of the telescope in a plane parallel to MN. Let EF be the field of view of the telescope, when seen on the paper by reflection from the prism; then the instrument must be so constructed, that when the telescope is in the position a b, and directed to the part of the landscape immediately adjacent to that which is contained in the field EF, the field of view FG, when seen by reflection from the prism, must be in contact with EF. When this happens, we have B b = C c, and the angle BF b = EBF the angle subtended by the field of view; but it is obvious, that when the telescope is moved from the position A B into the position a b, its angular motion round O, viz. the angle BO b, is equal to the angle comprehended by the field of view, that is, to the angle BFE; therefore, in the triangles OB b, BF b', we have the angles at O and F equal, and the side B b common; and consequently the side OB is equal to the side BC. From this it follows, that, in order to have the successive fields of view EF, FG, GH, all joined to each other, or at their proper relative distances, the distance of the eye from the paper must be equal to its distance from the centre of motion O round which the telescope revolves. The telescope should therefore be placed upon a stand so constructed, that the centre of mo-
tion O may be placed in different positions between the eye-piece and the object-glass; by which means, the observer may vary the distance of the paper from his eye, according as he wishes, to have his drawing on a large or a small scale. By the instrument, when thus constructed, we are enabled to take a connected panoramic view of any horizontal zone of a landscape, whose breadth does not exceed the field of view of the telescope. The objects contained in the different fields of view, will be arranged in a circle whose diameter is equal to the distance of the eye from the centre of motion.

This instrument is admirably fitted for taking a correct outline of the visible horizon, with all the various indentations with which that line is generally broken by the intervention of valleys and mountains. Unless the horizon is extremely and unusually contracted, the field of view of a common telescope will contain a zone which will easily comprehend every depression and elevation; and even when the place of the observer is embosomed in an amphitheatre of mountains which rise around him with various elevations, the field of view may be enlarged by diminishing the magnifying power of the telescope. For this purpose, the micrometrical telescope, invented by Dr. Brewster, is particularly applicable, as the magnifying power can be increased or diminished without changing any of the lenses; and as the distance between the eye and the centre of motion O, can be altered, even though the telescope is fixed to its stand. The micrometrical telescope having also the properties of a compound microscope, any long object which cannot be contained in the field of view, in the direction of its length, may be delineated in a similar manner. This contrivance cannot be applied to the common compound microscope, as it has not a motion round an axis.

The camera lucida of Dr. Wollaston might be fitted up with a horizontal motion, and without the aid of a telescope, so as to delineate one continued zone of a landscape; but when the objects are small; or at a considerable distance, a telescope becomes indispensably necessary. See the Philosophical Magazine, vol. xxi. p. 343; Nicholson’s Journal, vol. xvii. p. 71; vol. xxiii. p. 372; vol. xxiv. p. 146; and Brewster’s Treatise on New Philosophical Instruments, Edin. 1812, book i. p. 11, book iii. p. 138, and book vi. CAMERA OBSCURA. See OPTICS.

CAMERARIA, a genus of plants of the class Pentandria, and order Monogynia. See BOTANY, p. 141.

CAMERARIUS, PHILIP, a learned author, who flourished in the sixteenth and earlier part of the seventeenth century. Camerarius is the same name as Chamberlain, one which is known over the whole continent, and evidently derived from the office of chamberlain to princes and religious houses.

Philip Camerarius was the son of Joachim Camerarius, a distinguished character of his time, who was regarded as among the most learned men in Europe. He was born in the year 1597, and called Philip after Melancthon the reformer.

Philip Camerarius, at an early age, testified the same love of literature which has characterised other members of his family, and after receiving the instructions of his father, professedly studied the law. Having spent some years in this occupation, he left his native city Tubingen, and crossed the Alps to make a tour in Italy. An interesting fragment of a journal written on that occasion is preserved, which shews the state of the different places visited in his route, and proves that he possessed a mind capable of acute remark. The taste which he had acquired for the knowledge of the ancients, led him to those remains of antiquity which were most celebrated in history, and to cities such as Padua, Mantua, and Rome, which had given birth to eminent men.

The doctrines of the reformed religion had at that time made rapid progress in Germany, and the followers of Calvin and Luther were viewed with a jealous eye in countries subjected to the papal dominion. While Camerarius was walking the streets of Rome at mid-day with his companions, he was suddenly seized by the officers of justice, and carried to the prisons of the inquisition. Here he was confined a considerable time, and underwent repeated examinations concerning the religion he professed, the cause of his journey to Italy, and his acquaintance with certain individuals there. The fame of this sanguinary tribunal, and the danger of implicating the innocent, could not but fill both himself and his relatives with the most lively apprehension; though, by unusual good fortune, after the inquisitors having in vain endeavoured to make him a proselyte to the Roman Catholic faith, he was liberated. Being ordered to quit Rome, he repaired to his brother Joachim at Nuremberg in 1566.

Camerarius, after passing through some intermediate gradations, was promoted to be vice-chancellor of the university of Altorf in Franconia, and one of the state counsellors, offices which he filled with great applause during forty-two years.

At this time he was occupied, in conjunction with his brother, in editing the literary works of their father, which appeared in 1593 and 1595; and he was also engaged in the publication of his own writings. Of these, three volumes successively appeared under the same title, being Opera Horiorum subsidiestorum sine Meditations Historiae, which contain a number of philosophical and critical remarks, though more the result of reading than of actual experience. This work being well adapted to the prevailing taste of the times, was translated into several foreign languages; but the doctrines it contains, being too liberal for a people enslaved by bigotry, an edict was published at Rome in 1603, prohibiting every individual from having it in his possession, under the severest penalties. After this it entered the Index expurgatorius; libri quam prohibitorum.

Camerarius was also occupied in corresponding with his learned cotemporaries, such as Ritterhusius, Grynaeus, Langius, Hotomannus, and others;
CAMERONIANS, a Presbyterian sect in Scotland, which arose in the persecuting times of Charles II. They derived their name from one Richard Cameron, a young clergyman, who, having received ordination in Holland, where he had gone previous to the affair at Bothwell, returned to his native country, became a zealous and a popular field preacher, took an active part in the opposition, which was then made to the oppressive measures of the king, and was at last killed, along with several of his adherents, in an engagement which took place between them and the royal troops at Airsmoss, in the year 1680. When government found, that the Presbyterians could not be subdued into conformity, by the harsh and tyrannical measures which had hitherto been employed, it was agreed to attempt the same object by gentler methods; and for this purpose, an indulgence, as it has been called, was granted by the king’s authority, in 1683, to such of the ejected ministers as had “lived peaceably and orderly.” They were allowed to return to their respective parishes, and exercise their professional functions; and patrons were at liberty to present them to vacant churches. But the act was clogged with certain reservations and restrictions, which rendered the indulgence very disagreeable to men of scrupulous consciences. A second indulgence was issued by the lords of council, in 1679, holding out similar liberties, and qualified by similar conditions. Of these acts many took advantage, without feeling themselves chargeable with any violation of their covenant engagements. Many, too, who considered them as an encroachment on their religious rights, accepted of the boon which they offered, with a declared exception to their legality, and satisfied themselves with giving an open testimony against the Erastian power, exhibited in the acts of the council, and the ecclesiastical supremacy which had been exercised by the king. There were several, however, who peremptorily refused compliance upon any terms, and resisted every effort that was made to procure their submission. These were the persons afterwards denominated Cameronians. They conceived that such compliance necessarily involved an acknowledgment of the power, which the civil rulers claimed to give or withhold at pleasure their unalienable privileges, and consequently a declination of those principles which they were bound to maintain, both from a regard to Christ, the only head of the church, and from a regard to the solemn vows which they had taken before the world; and therefore they determined, whatever might be the consequences of their conduct, to separate from their conforming brethren, and struggle with the hardships and difficulties of their situation, till Providence should bring them deliverance. To the persecution, which, in consequence of their disobedience, they had reason to expect, they were soon subjected. The most arbitrary and vexatious proceedings were instituted against them. And such oppressions were practised, and such punishments inflicted, as were sufficient to instigate and to justify that rebellious spirit, which they afterwards displayed. It is very easy, as it is very common, to stigmatise these people with the epithets, fanatical and seditious; and it is not to be denied, that, in some instances, they went farther than either prudence or duty could warrant. But if we say this of men who were comparatively unenlightened, whose consciences were insulted in the nicest points, and who were hunted like beasts of prey, because they would not become the worst of slaves to the worst of masters, what language should be held with respect to the rulers whom they opposed—rulers who, by deeds of folly, injustice, and inhumanity, the most abominable in our national records, drove them into extremities, which they would otherwise have abhorred, and by which they must have been more certain of entailing misery upon themselves, than of giving any serious uneasiness to their oppressors? The Cameronians undoubtedly were intolerant, and gave harsh names and illiberal treatment even to the Presbyterians, whose general sentiments corresponded with their own, but from whom they found it necessary to separate. The charge of intolerance, however, should not be brought against them, by the admirers of Charles or of James. Their violent attachment to the reformation rights and the solemn covenants, may appear, to superficial thinkers, an expression of great weakness and ignorant zeal; but a very moderate attachment to these objects, which certainly contained the leading principles of liberty, was at that period equivalent to no attachment at all; neither indicative of sincerity, nor fitted to accomplish any substantial good. And, however much some of us may condemn, and others of us lament their excesses, both in doctrine and in practice, it is not very difficult to trace some connection between those very excesses, and the religious liberty which we enjoy—a connection well calculated to soften our censure, and diminish our regret.

The Cameronians became more united, systematic, and explicit in their views, in the year 1680; and in the following year, they began to form themselves into societies, and to have quarterly, or more frequent meetings, as circumstances permitted; and took the name of The Societies United in Correspondence. A paper was found on Mr Hall of Haughhead, at Queensferry, (called from that the Queensferry Paper,) containing the principal tenets of that sect; but containing also some expressions and sentiments, to which as a body they did not give their assent. They particularly disavowed the assumption of magistratical authority, to which the authors of it had ventured to lay claim. The tenour of this paper, and the conduct of a few people in attempting to rescue Mr Hall, provoked the council to issue a proclamation, granting power, among other things, to seize suspected persons, and mentioning Mr Richard Cameron and others by name. These having now completely broken off from the rest of the Presbyterian ministers and others, who would
not adopt their peculiar notions, met in arms at San-
quiar, and published a declaration or testimony, in
which they disowned the king’s right to the crown
and government of Scotland, and protested against
the succession of James, on account of their popery
and breach of covenant to God and the church. Mr
Richard Cameron wrote a vindication of this paper,
and a keen and lengthened controversy took place.
The rejection of the royal authority, thus broadly
and boldly avowed, is that part of their conduct,
which has given the chief handle to the opponents
and enemies of the Cameronians. Even some of their
own number were dissatisfied with the language of the
Sanquhar Declaration; and afterwards they a-
med and explained certain parts of it, while they
defended it in general, in their Informatory Vindic-
tion, drawn up by Mr Renwick in 1687. Besides
that declaration, Mr Cameron and about thirty others
composed and subscribed a bond for their mutual de-
defence. Very soon after this, the rencontre at Air-
moss happened, when the Cameronians were defeat-
ed, and Cameron and many more killed. In the
course of the year, those who had been made pri-
soners in that engagement were executed as traitors.
And a very strict search was made for the followers
of Cameron throughout the country, some of whom
were taken, and put to death for their non-conformi-
ty and rebellion. For a long while these unfortu-
nate people were the objects of persecution and ven-
gence. No pity was shown to age or sex—to cha-
acter or condition; and government seemed resolved
to demonstrate to the world, that they did not in
any measure deserve the allegiance which they so ri-
gidly demanded, and for withdrawing which the Ca-
meronians were so severely punished. It is unneces-
sary to give an account of the sufferings which they
endured, from the resentment and cruelty of their
rulers. In 1686, there were some divisions among
them. A considerable number disapproved of the
violence of Mr Renwick, who was now at the head
of the party; and not only separated from them, but
published testimonies against some of their proceed-
ings. The great point of difference seems to have
been, that the former would not unite with such of the
suffering Presbyterians as did not go all lengths
with them, while the latter acted on more liberal
principles, and were for associating with all who held
the same general sentiments, and were in the same
distressful circumstances. It was on this occasion
that the Informatory Vindication was drawn up. In
1688, Mr Renwick, who appears to have been a
pious worthy man, was seized, tried, and executed
at Edinburgh. He died in the avowal of those doc-
trines, respecting the authority of the king, which
he had hitherto maintained. He was the last who
suffered publicly for the cause of religion. The re-
volution put an end to the calamities of the Camero-
nians, as it put an end to arbitrary sway, and to per-
secution for conscience sake. The Cameronians still
exist as a distinct sect; but they are as inconsider-
able in numbers, as they are decent and peaceable in
their deportment. See Wodrow’s History of the

Sufferings of the Church of Scotland; Hind let
Loose; and Burnet’s History of his own Times. (+)

CAMILLUS. See Rome.

CAMOENS, Luis De, the epic poet of Port-
ugal, was born at Lisbon in 1517. His family was
of considerable note, and originally Spanish. His
misfortunes began early in life. In his infancy, his
father, Simon Vaz de Camoens, commander of a ves-
sel, was shipwrecked at Goa, where, with his life,
the greater part of his fortune was lost. His mo-
ther, however, provided for his education at the
university of Coimbra; where, in spite of Voltaire’s
rash assertion, that his youth was spent in idleness
and ignorance, it appears from his works that he
must have imbibed the matter as well as the spirit of
classical learning. When he left the university, he
appeared at the court of Lisbon, and mixed in its
fashionable intrigues; but his personal beauty, his
ardour and accomplishments, are supposed to have
tempted him to amours above his rank, for he was
banished from court; and as he has ascribed, in his
poetry, the misfortunes of that period of his life to
love, he is conjectured, like Ovid, to have cherished
the passion too ambitiously.

He retired from court to his mother’s house at San-
tarene, where he began his poem on the discovery
of India, but quitted his retirement to join an expedition
which sailed from Portugal against Ceuta, in Africa. In
a naval engagement with the Moors in the Straits of
Gibraltar, he lost an eye, but distinguished his brava-
sory so much in this and other actions, that he was
recalled to court. From thence he was chased once
more by the characteristic jealousy of his country-
men, who still dreaded poetic gallantry amongst the
court ladies, though his countenance had been so
sadly marred.

In 1553, he sailed to India, with a resolution ne-
er to return, and little foreseeing the evils that were
to shake that resolution.

When he arrived in India, an expedition was ready
to sail to avenge the King of Cochín on the King
of Pimenta. Without any rest on shore, he joined
this armament, and in the conquest of the Alagada
islands, displayed his usual bravery, not forgetting
his duty as a poet, to celebrate the victory.

In the year following, he attended Manuel de Vas-
cellos in an expedition to the Red Sea. “Here,”
says Faria, “as Camoens had no use for his sword,
he employed his pen.” Nor was his activity confined
to the fleet or camp. He visited Mount Felix, and
the adjacent inhospitable regions of Africa, which
he so strongly pictures in the Lusiad, and in one of
his little pieces, where he laments the absence of his
mistress. When he returned to Goa, he had tran-
quility to review his great poem, but imprudently
he stepped out of the epic strain to indulge in satiriz-
ing the viceroy Francisco Baretto, by whom he was ba-
nished to China. Even in exile, however, he still
found friends, and his talents made him useful. He
was appointed commissary of the estates of the de-
funct in the island of Macao, where he continued
for several years, proceeding with his Lusiad, and

* Quoted by Mickle.
acquiring a small fortune. This fortune he unhappily lost on his return to Goa, by the permission of a new viceroy. He was shipwrecked in the gulf, near the mouth of the river Mecon, saving only his poems, which he held in one hand, whilst he saved himself with the other. At last, reaching Goa, he found a friend in the new viceroy, Don Constantine de Braganza. Still, however, the fate of the poet seemed to be

"Marking each change of place with change of woe."†

A new governor succeeded Constantine, who suffered Camoens to be thrown into a common prison, on a charge of misconduct in the commissariat of Macao. He fully acquitted himself at a public trial, but was detained in confinement by his creditors till the gentlemen of Goa set him at liberty. He now resumed the profession of arms, and attended Don Pedro Baretto, who went as governor to the distant and barbarous settlement of Sofala. A ship bound homeward having touched at this place, Camoens determined to return in her to Europe. He was detained for a while by the governor, on a mean charge for the hospitality he had received at his table. Two friends of the poet paid the pitiful demand; and thus, says Faria, Camoens and the honour of Baretto were sold together.‡

He returned to Lisbon after an absence of sixteen years, unfortunate even in the time of his arrival, when the pestilence raged in the city, which prevented the appearance of his poem for three years. At last the Lusiad was printed in 1579. It is not certain whether he ever obtained a pension from Sebastian, then the sovereign of Portugal. If he ever did, it was but a small one, and was probably revoked by Cardinal Henry, who succeeded Sebastian. The latter prince was young and illiterate, and more capable of enjoying the sports of the field than the beauties of poetry. But though the story of the pension is doubtful, and is said to have been held on condition of the poet's residing at court, an expence which the sum would not afford, it is not more wonderful that the young king should be sensible of the honour bestowed on him by Camoens in his address at the opening of the first, than that a bigot like Cardinal Henry should neglect the greatest genius of his age and country. Henry patronized learning indeed, at least what was called learning by the monks and friars. They transmitted to him all their childish forgeries of inscriptions and miracles. This same Henry was the persecutor of George Buchanan; the patron of the Inquisition, of which he extended the horrors even to Goa in the east. Under his weak, and wicked hands, the kingdom fell into utter ruin. When we find Camoens exhorting, in his patriotic poetry, young Sebastian, this priest-king's predecessor, to exclude the clergy, by which he meant, in the first instance, Cardinal Henry from state affairs; when we look to the man of genius neglected by this worthless sovereign; traduced by his monkish contemporaries; yet, in his old age and misfortunes, lamenting less for his own fate, than for the approaching ruin of his degenerate country,—Camoens, with these worthy sentiments, and this unworthy destiny, commands an elevated and respectful sympathy. It is not merely the old man, or even the neglected man of genius dying in an hospital—it is the patriot and the patriot bard—the hero and the soldier—the friend of truth, as well as the encourager of fiction, ennobling even his death upon a flock-bed, by those sentiments, which deepen, by contrast, the disgrace and degeneracy of his country. "I am ending (he says in one of his letters) the course of my life—the world will witness how I have loved my country." By some, it is said, he died in an alms-house. It appears, however, that he had not even the certainty of subsistence which those houses provided. He had a black servant who had grown old with him, and who had long experienced his master's humanity. This grateful Indian, a native of Java, who, according to some writers, had saved his master's life in the unhappy shipwreck, where he lost all his effects—this Indian, grown old and white haired in his service, begged in the streets of Lisbon for the only man in Portugal on whom God had bestowed those talents which have a tendency to erect the spirit of a downward age. He died in the year 1579, in his 62d year.

While Trissino, says Voltaire, was clearing away the rubbish in Italy which barbarity and ignorance had heaped up for ten centuries in the way of the arts and sciences, Camoens, in Portugal, steered a new course, and acquired a reputation which lasts still among his countrymen, who pay as much respect to his memory as the English to Milton. This criticism, though true as it respects Camoens, is quite French with regard to Trissino. Ariosto did a thousand times more to restore poetry in Europe than Trissino, who wrote a heavy poem in strict imitation of the ancients, intended as an antidote to the magic wonders of the bard of Reggio. But it did not succeed; and Tasso, who made the ancients more expressly his models, was still obliged to adhere to the speciosa miracula of the fabulous school.

The able translator of the Lusiad, Julius Mickle, has indignantly spurned at the charge of incongruous machinery which Voltaire brought against the Lusiad. Voltaire, as an instance of this, quotes the passage where Gama, in a storm, addresses himself to Christ, and where Venus comes to his relief. "There is no such passage," answers Mickle, "in the Lusiad. Gama, in a tempest, prays to the Holy Power, to whom nothing is impossible—the Sovereign of earth,
It is true that Mickle has exposed several glaring instances of ignorance and misrepresentation in Voltaire's critique; his mention of Emanuel II. of Portugal, for instance, and his notion of the poet having actually sailed with the discoverer of the passage to India. It is true, also, that whenever a good joke was in view, especially if the Virgin Mary could be included, our French philosopher was generally seized with a shortness of truth. But if we look to Mickle's vindication of the Portuguese poet's machinery, it is not satisfactory. Gama prays to the Sovereign of Earth and Heaven, who delivered Paul and the children of Israel. It is needless to tell us that this is the Jupiter Optimus Maximus—the great Philosopher (Voltaire and by Voltaire, he means it—very clearly—by a saint, by savage, and by sage). It is the living and true Deity of the Bible; and being such, Venus (though we should call her the celestial Venus, and the great principle of love) has nothing to do where such a sacred name is implored. The criticism of Voltaire still remains unanswered: that the hero and the object of the entrepreneur being Christian, Heathen deities are improperly introduced. His translator contends, that whatever may be said against the ancient machinery in a modern poem, candour must confess that the allegory of Camoens, which arms the genius of Mahommedanism against the expedition of his heroes, is both sublime and most happily interesting. The genius of Mahommedanism, we cannot but remark, had no motive to oppose the success of Gama and his followers, unless it was to oppose the progress of Christianity. Had the political genius of Asia been alarmed and brought into action, the poet might have supposed his readers to forget the religion of Europe; but when the religious genius of Asia is brought forward as an agent in the poem, it is needless to excuse Camoens, by alleging, that Christ is not mentioned; the Christian religion is irresistibly brought to our recollection; our hopes are awakened for the success—our fears for the misfortunes of its cause. How much more consistent is the machinery of Tasso, who leads our imagination to blend the interests of witchcraft, Paganism, Mahommedanism, and hell itself, in one common view, as opposed to the cause of Christianity! This is a great and consistent machinery, fully copied by Milton, who identifies the Pagan deities, and the Infernal cherubim and seraphim, and thus cloaths himself in the spoils of superstition. On the whole, the defence of Camoens for his Venus, Mars, Neptune, and Jupiter, though ingeniously pleaded by Mickle, is not made out. It is a maxim in law, that the insinuatio legis is not an apology for delinquency; and all that can be said for Camoens is, that he knew not the law of consistency.

Another objection to the Lusiad, very generally adduced, is the baldness and want of elevation of the style. This Mickle has strenuously denied, and insists, that an uniform simplicity and manly diction characterises the Portuguese epic. This question we ought to leave Portuguese scholars to decide; observing, at the same time, that the translator's ornamental diction is not a proof of such a fault in the original. English poetry was in a high state of artificial efflorescence when Mickle wrote, and he might find or deem it impossible to arrest the public attention by a faithful adherence to the primitive simplicity of his author. Mickle has also added considerably to the outlines of the very story of the poem. In so doing, he has been generally commended by the best judges. This we think a more conclusive circumstance against Camoens. The colour of a poem may require heightening in passing from a simpler to a more refined language; but the form and substance of a story we should suspect to be defective, which needs addition to make it interesting in any transmission.

Paradoxical as it may seem, it has been said, perhaps with more truth of the Lusiad than of any other epic, that its defects prove its beauties, since the attractions of the poem have prevailed to render it popular in spite of those defects. The Lusiad abounds with pictures of manners, from those of the highest chivalry to those of the rudest, fiercest, and most simple barbarism. The characters are strongly sketched; the heroism of Gama and of his friend Monzaida (the Achates of the Lusiad), are nobly contrasted with the base, selfish, and perfidious portraits of the Zamorim and the Moors. To the manners of the piece, the novelty of fire-arms is also added; and this artificial trait in the modern materials of a battle, is introduced with a most dignified and dexterous simplicity. The island of Venus of Camoens furnished to Tasso the prototype of his enchanted forest, as the garden of Armida furnished our Spenser with his bower of bliss. In this part of his poem he is alike rich and original. The apparition which, in the night, hovers athwart the fleet

* The Messiah, however, and the Catholic faith, are abundantly mentioned throughout the Lusiad.

† Mickle justifies this allegorical machinery by the Henriad; but this against Voltaire is merely an argumentum ad hominem. Allegory under any form, but most of all under Pagan names, is unfitted to support a modern epic poem. It is in vain that Botuloe tells us—

Chaque vertu devient une dignité ;
Monceau est la Prudence, et Venus la Beauté.
Ce n'est plus le sageur qui produit le tonnerre
C'est Jupiter armé pour effrayer la terre.
Un orgue terrible aux yeux des mélètes,
C'est Neptune, en courroux, qui gourmande les flots.

L'Art Poétique, Chant 3e.
near the Cape of Good Hope, is one of the grand-
est of poetical fictions, and the invention is com-
pletely his own. We subjoin the translation:

— "Rising through the darken'd air,
Appall'd, we saw a hideous phantom glare;
High and enormous o'er the flood he tower'd,
And 'twas their way with sullen aspect lower'd.
An earthy paleness o'er his cheeks was spread;
Erect upon his hair's wither'd red.
Withering to speak, his sable lips disclose,
Sharp and disjoin'd, his gnashing teeth's blue rows;
His haggard beard flow'd quivering on the wind;
Revenge and horror in his mien combin'd.
His clouded brow, by withering light'nings scar'd,
The inward anguish of his soul declar'd.
His red eyes glowing from their dusky caves,
Shot livid fires — far echoing o'er the waves
His voice resounded; as the cavern'd shore
With hollow groan repeats the tempest's roar."

CAMP. See Castrametation.
CAMPAGNA DI ROMA, formerly Campania, is
a province of Italy, which comprehends the greater
part of ancient Latium. It is bounded on the north
by Sabina; on the east and south east by Abruzzo
Ultra, and Lavoro; on the south west by the Me-
diterranean; and on the north west by the Patrimony
of St Peter.

The Campagna di Roma, which is about 45 miles
broad in almost every direction, is, as its name de-
notes, a flat and level district, interspersed with but
few elevations. In approaching Rome from the north,
the sky-line towards the south and south-west has
the appearance of one uninterrupted level, except
where the dome of St Peter's rises majestically above
the horizon, and indicates, at the distance of many
miles, the position of Rome. The soil of the Cam-
pagna is wholly volcanic, and seems to be com-
posed chiefly of the detritus of pumice-stone. It is
generally dry, but wherever there is moisture, the
vegetation is very luxuriant.

The elevations of the Campagna, to the south of
the Tiber, have commonly the form of great waves,
whose summits are very distant from each other, and
the intervals between these elevations are valleys
which drain to the Tiber or to the sea, and form
the richest meadows. These elevations are all vol-
canic, and have a nucleus of hard stone, called
peperino, or tuffa, which appears to be only the
volcanic matter in a state of higher induration.
These hills are pierced in every direction by ca-

CAMPAGNA

the whole of Latium was formerly a gulf of

vans, and the pebbles were stratified

at the time when the submarine volcanoes were in-

action. "Toutes ces cavernes prouvent que les eaux
qui ont stratifié ces galets ont fait leur ouvrage dans
le tems des volcans, qui melant leur ejections parmi
les depots des fleuves, ont enfin fait sortir de la mer
le sol de cette Rome, destinee comme les volcans dont
elle est issue, a devenir le foyer d'autres bouleverse-
mens."

The highest eminence in the Campagna is Monte
Albano, now Monte Cavo, which is about six leagues
from Rome, and rises about 2920 feet above the le-
vel of the sea. It is united at its base, on one side,
to the Algidus of the ancients; and on the other, to
Monte Velletri, and forms an immense insulated mass,
situated on an extensive plain, and almost at an equal
distance from the sea and the calcareous mountains
of Sabina. A chain of hills surrounds the base of
Monte Cavo; and on the tops of those which encircle
the northern side of its base, are placed the villages
of Compiti, Colonna, Monté Porcia, Frascati, Rocca-
di-Papa, Marino, Castel Gandolfo, Albano, Larri-
cia, Gensano, and Citta Livigna. This mountain
is composed of volcanic ejections, and the Rocca di
Papa consists of tuffa.

Mount Soracte, which is about eight leagues north-
east of Rome, is completely insulated, and rises to
the height of about 2119 feet.

The next principal eminence in the Campagna,
is the Villa Millini, which is placed on the summit
of Monte Mario, about half a league to the north
of Rome. Its height, above the level of the sea, is 440
feet, and as it occupies the centre of the great plain,
it commands a most extensive view of the Campagna.

The rock of which it consists, is filled with shells,
but is slightly indurated, and the base of the hill rests
on the volcanic matter which surrounds it. Bonset-
ten supposes that Mount Albano and Soracte have
both a calcareous nucleus below the volcanic mat-
ter, and that the whole base of the Campagna is
likewise calcareous. As a proof of this, he mentions
that in the Grotto del Mondo, at Tivoli, large cal-
careous stones are found embedded in the volcanic
ejections which form the vault of the caverns. The
great plain of Rome is completely free of stones, and
those which do occur are either brought there by the
hand of man, or detached from some neighbouring
volcanic rock. The streets of Rome, and all the
ancient roads, are paved with hard lava; and it is only
on the side of Palestrina, the ancient Prenesti, that
calcareous stones appear in the volcanic soil.

The volcanic ejections seem to have had their prin-
cipal direction from north to south, since Monte Ca-
vo, the highest elevation, is entirely enveloped, while
the Villa Millini is scarcely covered; and on the cal-
careous hills to the east the volcanic soil terminates
at the height of 30 or 40 toises above the plain.

A ridge of hills raised about 300 or 400 feet above
the level of the sea, stretch in a direction parallel to
the coast, from the Tiber to Torre St Lorenzo, be-
yond Ardea. The tongue of land which lies be-
tween this range and the sea is entirely formed by
the alluvation of the Tiber and of the sea, which throws
back upon the land, the sand which is carried down by the river. The whole of the country, which was the ancient Laurentum, is extremely fertile, and the climate very temperate.

Though different travellers have pointed out craters in various parts of the Campagna, yet there appear to be only three which are characterised with sufficient distinctness. The first of these is the famous lake Regillus, which is about a quarter of a league in diameter. It is placed at the bottom of an inverted cone of hard black lava, from forty to sixty feet high, which forms bare and rugged rocks, and is entirely open on the side of the road where the lake is level with the plain. This crater is not like those of Albano and Nemi, covered with volcanic ejections which take away from it the regular form of an inverted cone; but the lava is almost completely uncoiled in its upper part.

The two other craters of Albano and Nemi are about four or five hundred feet higher than that of lake Regillus. They are covered with volcanic ejections several hundred feet in height, which prolong the cone from the hard lava which forms the basins of the lakes. These two craters are of a very regular conical form, and so extremely high that it requires half an hour to ascend from the lake to the top of the higher cone. The famous emissary made at the siege of Veii, is cut precisely between the volcanic ejections, which are easily pierced, and the hard lava which now contains the remaining waters of the lake. When the lake occupied the higher part of its extensive basin, the immense mass of waters which it contained were in danger of overwhelming the rich plains below. The wealthy citizens of Rome, alarmed for the destruction of their fields, are said to have made use of the siege of Veii as a pretext for employing the people, or a part of the army, to cut the emissary, by which the superabundant water was discharged.* The crater of Nemi is a very little smaller than that of Albano, but is equally regular and picturesque. Its cone does not appear to have been at any time entirely filled with the water of the lake. The lava in the Campagna is everywhere where of an uniform hardness and appearance; and wherever it appears, it is covered with volcanic ejections.

There are numerous sulphureous springs in the Campagna, but the most abundant of those is between Tivoli and Rome, where the water comes out of the ground almost boiling hot, and forms the lake of Solfatara. The reeds and other vegetables are so incrusted with calcareous deposition, that they have the appearance of stone, and islands of a considerable size, which are formed by them, float about the lake, and are capable of carrying several people at a time. The stream issuing from this lake has the same property, and continues to smoke till it joins the Anio or the Teverone. The Anio possesses a similar property of forming calcareous depositions of every shade, from the brilliant crystallisations, which are called confetti di Tivoli, to the darker concretions, which have incrusted a forest very near Rome. Near Subiaco the minutest insects, and the leaves of the vine, are distinctly seen in these incrustations. After the Anio has passed the fine cascades of Tivoli, it forms, by depositions in the great plain, those immense beds of travertino, of which St Peter's, a part of the Coliseum, and all the other public edifices in Rome are built. There are likewise several springs of acidulous water without any sulphur, as at Aqua Acetosa.

The Campagna contains 112,909 rubbias (a rubbia of land contains 4860 square toises) or 940 square miles, of 74 to a degree. About two thirds of this land belongs to the church, and the other three fifths to about a hundred lay proprietors. The farms are held by leases of nine years, and also by perpetual leases; but the last of these leases is abrogated if the farmer neglects for two years to pay his rent. The general price of a rubbia of good land is about twenty piastres, and the expense of cultivating it amounts to about forty piastres.

Six labourers, estimated at — 14
A rubbia† and half of seed — 12
Manure — 5 30
Reaping, carting, and thrashing — 8 50

Total expense — 40

Before the revolution, a rubbia of corn was sold at six or eight piastres; but in the year 1802, the price varied from 22 to 30 piastres.

The ground is sown every third year. During the first year it lies in fallow. It is laboured the second year, and the third year it produces a crop. The soil is wrought six times; the first operation is called rupitura; the second, which ought to be a foot and a half deep, is called reconditura; the third, reponentura; the fourth, rinquantatura; the fifth, rifrescatura; and the sixth, seminatura. From the great quantity of rain which falls, particularly in the southern part of the Campagna, and from the rapidity with which it descends, the greatest care is taken to carry it off the fields. In every field there are three kinds of ditches, viz. small parallel ditches called line by the ancients, and placed at the distance of three feet. These are traversed by wide ditches, placed at a greater distance, and large canals, called collineate, carry off from these the superfluous water.

Excellent fruit, vegetables, and almost every species of grain are produced in the Campagna. Extensive plantations of Turkish wheat grow in the lower grounds; it rises to a considerable height, and is used for various purposes. The stalks of it form canes for the support of the vines, and are also used in the construction of cottages; a leaf is employed for thatching them, and likewise for mattresses, and the flour composes various dishes, which are eaten by all ranks, and are regarded as particularly wholesome and nutritious.

The large reed, (the arundo donax), which rises to the height of twenty feet, is cultivated with great advantage. Oxen and asses feed upon the leaves of it: It forms an admirable support to the vines in a country not much exposed to violent winds, and after having served this purpose, it is still useful for burning. That part of agriculture which relates to the breed-

* This work was executed in the year of Rome 338.
† A rubbia of corn weighs 640 pounds French of 12 ounces.
of cattle is completely neglected in the Campagna. M. Bonstetten observes, that at Torre-Paterno, within seven leagues of Rome, he saw a herd of several hundred cows, which the farmer would not take the trouble of milking, though milk is as dear at Rome as in any of the other large cities of Europe. The great defect, however, in the agricultural operations of this and other parts of Italy, arises from the total want of judgment which is displayed in the application of the soil. Vineyards are planted in the most fertile and best watered land, which is particularly fitted for the growth of corn. Corn is sown in land which is particularly adapted for the vine; and wood is planted in the finest meadows; while the ground fit for wood is not used at all. "J'ai vu des champs," says Bonstetten, "escarpés et pierreux cultivés en blé, qui rendent à peine deux pour un, tandis que la vigne étoit placée dans le terrain le plus gras, et le mieux arrosé, et que les tiers du bétail avoit pour faim la foin pour le nourrir pendant quinze jours de neige."

On the day of St Lawrence, (the 10th of August,) when the harvest is completed, and when the heat is generally greater than in any other season of the year, the inhabitants begin to burn the stubble, the ashes of which is almost the only manure which is employed. As the crops of grain grow to a considerable height, the reaper never stoops, but takes off the head and about a foot and a half of the stalk, and thus leaves the stubble about two or three feet long. After the conflagration is over, numbers of snakes, of a large size, are scorched to death, and others are choked, in attempting to cross the dusty roads, in order to escape from the fire. The smoke from the burning straw is extremely offensive to the traveller; and it not unfrequently happens, that the hedges or forests are burnt down by the flames.

The very small number of farm houses which exist in the Campagna, are miserable dwellings, built as appendages to old towers or temples, and are constructed out of the fragments of these ancient edifices. The inhabitants of these wretched hovels are compelled to desert them in the middle of summer, when fevers and agues prevail in the country; and they sleep either at Rome under the porticoes of the palaces and public buildings, or in the towns which are nearest to their farms. If they remain too long in the country, they are seized with the diseases which we have mentioned; and in the month of July, August, and September, the great proportion of patients in the Roman hospitals are the peasants from the surrounding country.

It appears from the testimony of Strabo, Pliny, Varro, and other ancient authors, that the air of the Campagna was formerly very salubrious except in a few places near the sea, where the soil was marshy. The unwholesomeness of the climate is said to have commenced about the sixth century, and to have arisen from the overflowing of the Tiber, in consequence of the accumulated rains by which it was raised above its former bed. It does not appear, however, from the best observations, that the bad air (patita ariu) of the Campagna is owing to the stagnant water arising from the inundations of the Tiber, for it is chiefly in spring, in the time of the greatest drought, and in the months of August and September, long after the inundations of winter, that the bad air prevails. When the first rains of autumn succeed to the great droughts, the bad air completely disappears. On the Rocca di Papa, and on one side of the plain of Tivoli, the bad air is never experienced; but at different heights below this line, it seems to be equally prevalent. In 1775, the heights of Trinita del Monte were reckoned out of the reach of the bad air, but in 1802 they were completely under its influence.

The Pontine marshes which lie at the southern boundary of the Campagna are so extremely insalubrious, that it is dangerous even to travel through them in summer and autumn. Various attempts have been made by the popes to drain this unwholesome tract. "Pope Pius VI. at a great expense," says an anonymous author, "converted a very considerable part of these pernicious marshes into pasturage, corn fields, and rice plantations. He made a canal 20 miles in length, which conveys the once stagnant waters into the sea; and he intersected it with many lesser channels, which direct them so as to fertilize the fields, which they once rendered useless and pestiferal." It appears, however, from the observations of M. Bonstetten, that the insalubrity of the air has rather increased than diminished since this partial draining was completed.

The south-east and south-west winds, the scirocco and libeccio, are extremely oppressive and insalubrious, though in winter the former contributes much to the mildness of the climate. The tramontano, or north wind, is delightful in spring and autumn, but in winter it occasions severe cold. The ponente, or west wind, still retains the character of the zephyrs, and the Eolian brezes of the ancients.

The wind commonly blows from the east in the morning; declining sometimes to the north, it becomes north-east, and at other times, turning to the south it settles in scirocco. It is generally south, however, at noon, and then declines to the east or west, but most frequently to the latter, and often becomes due west, which continues all the evening and part of the night. This and the northerly winds are generally accompanied with a considerable dew. The south wind, which prevails at noon, particularly in summer, is a sea breeze, and renders the meridian heat of the sun. It appears from a meteorological table kept at Rome in March, April, and May 1803, that the average height of the thermometer exposed to the north in March was 60° Fahrenheit, in April 70°, and in May 68°. The minimum height during these three months was 52°, and the maximum 75°.

We have no information respecting the trade and manufactures of the Campagna, which must be very limited. Sulphur is obtained in great quantities from a mine about four miles from Nettuno; and at a place called Campo Leone, there are iron works belonging to Prince Doria. There are several manufactures of paper, iron, and corn mills erected on the stream Marrana, near Grotta Ferrata; and there are various manufactures of paper, iron, and oil upon the Anio. Gunpowder is made on the spot where the villa of Maecenas once stood. Flax is cultivated in considerable quantities in the Valle di Laricia; and a good deal of manna and turpentine is collected in the neighbourhood of Monte Spaccato. The cultivation of the vine is well understood in the Campag-
na, but no where are the inhabitants so little ac-
quainted with the art of making wine. Oil is made
in great quantities, and the proprietors derive a con-
considerable part of their income from this source. The
principal towns in the Campagnia are Rome, Velletri,
Frascati, Palestrina, Terracinas, Nettuno, Ostia, and
Tivoli. See Pliny, lib. xviii. cap. i.; Varro, lib. ii.;

CAMPBELL, Archibald, Marquis of Argyle,
son of that Marquis of the same name who suffered
dean unjustly in the reign of Charles II. The fa-
ther was firmly attached to the Presbyterian church
of Scotland, and to the constitution of his country,
settled by law. He never disguised and never
changed his sentiments with regard to either. But
he lived in critical times; he was under the reign of
a weak monarch; and he had many enemies among
those who, while they unfortunately enjoyed the royal
confidence, were profligate enough to abuse it to the
purposes of bigotry, selfishness, and resentment. He
was tried before the Scottish parliament for abetting
the usurpation of Cromwell; though, in point of
fact, he had done nothing more than submitted to it
from necessity; and if it was criminal and treasonable
do so, his prosecutors and his judges were as guilty
as himself. His destruction, however, was resolved
upon; and in spite of the ability of his counsel, the
demonstrations which were given of his innocence,
and the precautionary conduct of the king, who ra-
ther interfered in his behalf, he was condemned to be
beheaded at the cross of Edinburgh. He bore his fate
with heroic intrepidity and Christian resignation.
It has been the general, and should be the universal,
opinion that he suffered most unjustly. Clarendon's
account of his conduct, trial, and execution, is given
with great spirit, but with every degree of unfairness;
nor is Mr Hume's representation of him much more
consistent with truth.

The subject of this article was educated in the
principles of loyalty and religion, and soon distingui-
ished himself by his personal merits. When Lord Lorn,
he was appointed colonel of the foot guards by a
commission from the king, in which command he dis-
played great bravery at the battle of Dunbar. He
persevered in his attachment to the royal cause long
after its affairs were desperate, not merely continuing
faithful as a soldier to his military trust, but even
joining with the enemies of his family in promoting
the king's interests, and doing every thing that he
could to alleviate the sufferings of his master. Nor
did he refrain from his opposition and active hostility
to the new government, till he received orders from
Charles himself, in 1655, to capitulate. This con-
duct, of which the monarch seemed to entertain a very
high opinion, and which he rewarded at the time with
marks of his confidence and favour, gave great of-
fence to Cromwell, who pursued him with the keepest
resentment, and excepted him out of the general par-
don which he issued in 1654. After his capitulation,
he lived as a peaceable subject; but his submission
was evidently constrained, and accordingly he was
the object of perpetual suspicion. He refused to own
the authority both of the Protector and of Richard.
Informations were repeatedly lodged against him;
formal security was taken for his good behaviour;
persons in his service were bribed to watch him; he
was even committed to prison in 1657, when some
disturbance took place in Scotland; and what shews
as much as any thing the tone of his political prin-
cipals, the king reposed in him as much confidence
as he placed in any other person in the kingdom.

When Charles was restored, Lord Lorn went up
to London to congratulate his Majesty upon that
event, and carried with him a letter from his father,
which the king received in a kind and flattering man-
ner. He remained at court during his father's trial,
and employed all his influence to prevent the unjust
and melancholy fate in which it issued. This labour
of filial love, which was as amiable as it was unsuc-
cessful, instead of winning the esteem, only embittered
the animosity of his enemies, who immediately sought
his destruction on the most frivolous pretense. Hav-
ing convinced the Earl of Clarendon that his father
had been treated most unfairly and injuriously, he
wrote a letter to Lord Dufus, communicating that
important fact, and using some free expressions re-
specting the conduct of those who had been most ac-
tive in carrying on the prosecution. The letter was
intercepted, carried to Lord Middleton, exhibited to
the Scottish parliament, considered by them as a libel
on their proceedings, and made the ground of a re-
presentation to the king; who, though he confessed
there was nothing criminal in it, yet pronounced it
indiscreet, and commanded Lord Lorn to go down
in Edinburgh. His Lordship had no sooner arrived
than he appeared before parliament, and made a speech
in his own vindication. He was, however, committed
prisoner to the castle. A process was commenced
against him, and being found guilty of lessing mak-
ing, or of creating disension between the king and
his subjects, by giving the former false information,
he was condemned to lose his head; and to forfeit all
his estates. The day of his execution, however, was
left to the king's pleasure. When the news of this
proceeding reached England, it filled the court with
astonishment. Charles himself had no conception
that any body of men could turn such a slight mis-
demeanour into a capital offence. And Clarendon
deplored, that if his majesty suffered such a danger-
ous precedent to take place, he would leave the king-
dom as fast as his gout would permit him. After
ten months imprisonment, Lord Lorn was liberated,
June 4, 1663. By this time, Middleton, his invariable
foe, had fallen into disgrace, and his own friends
risen to power. A royal patent restored to him his
grandfather's title and estate, and, besides other ad-
Advantages of a similar kind, the king, as a mark of his
The Earl of Lauderdale, to whom he was partly indebted for this change in his fortunes, received from him considerable support in the administration of public affairs. Argyle, however, would never countenance or assist him in any of his violent measures. They were both Presbyterians; but Lauderdale carried the prerogative high, and vigorously maintained the bishops in Scotland, because he found all this conducive to the preservation of his influence at court; whereas, Argyle acted in strict conformity to his principles, and was a Presbyterian both in heart and in practice. Through the tyrannical procedure of Lauderdale, Archbishop Sharp, and others, a spirit of rebellion was engendered among the people, and in 1666 it burst forth in the west with considerable fury. The Earl of Argyle retained the loyalty by which he had been uniformly distinguished, and raised 1500 men to be employed in quelling the insurrection, though the Archbishop was too jealous to call them into the field. The rebels were defeated at Pentland. Great cruelties were perpetrated by the king's troops after the battle, and cruelties still greater and more extensive were committed by his ministers and judges under the form of trial, and under the pretexts of justice. His majesty himself interposed to prevent the further effusion of blood: but it was not long before his servants had recourse to the same excessive severities which had formerly provoked the country to take up arms. Lauderdale, who was now created a duke, began to forsake some of his old friends, who refused to lend their sanction to his arbitrary conduct. Among these was the Earl of Argyle. But the minister knew too well his influence with the king, and his interest in the country, to deprive him either of his seat at the privy council board, or of his place as a lord of the treasury. Lauderdale, in 1678, most inhumanly brought down the Highlanders, at that time a lawless and savage band, to live at free quarters in the western parts of the kingdom. To this measure, at once impolitic and barbarous, Argyle refused to give any active concurrence; but, at the same time, he acted a moderate and prudent part, by not joining in the attack which was made upon ministry in consequence of that unjustifiable step. The Duke of York, being sent by the king in 1681, to take the management of Scottish affairs, he conducted himself with so much temper in general, and so obligingly to the earl in particular, that they were on good terms for a considerable time. But the duke, having questioned Argyle pretty closely about the government in Scotland, he discovered that he had principles and views quite adverse to those by which he himself and his brother were actuated; and, therefore, though still externally civil to him, he began to assume a coldness and reserve which indicated a change of his sentiments, if, indeed, his real sentiments towards the earl were susceptible of any change. An act was passed this year by the parliament for establishing a test, obliging all who filed any office, to swear that he would attempt no alteration in the constitution of church or state. While this act was under discussion, Argyle opposed it with the utmost boldness and vigour. And after his opposition had proved fruitless, he would not take the test without an explanation of the meaning which he attached to it. This was also done by the Marquis of Queensberry; while many expressed their scruples about the oath, and others refused to take it at all. The earl sent his explanation to the Duke of York; his royal highness declared himself satisfied with it; and the earl was permitted to sign it in the qualified sense which he had affixed to it, and to sit and deliberate accordingly as a privy counsellor. It is also worthy of remark, that the privy council themselves, on the very same day, gave an explanation of the test similar to that which had been given by Argyle, and that the clergy were allowed the privilege of signing it, with an adjection to that purpose. But his lordship was an obnoxious man to those in power, and what was reckoned venial or innocent in others, was in him an unpardonable crime. A design was formed against him, and through the malice of his enemies, and his own consistency and firmness, on which they could always calculate, it unfortunately succeeded. He was most unreasonably required to take the test a second time as a commissioner of the treasury. He offered the same explanation; but when desired to subscribe it, which demonstrated to him that there was some insidious view in the proposal, he refused to comply with it. A complaint was sent to the king against him, and in the mean time he was committed prisoner to the Castle. But before an answer from his majesty could arrive, a prosecution was commenced. He was first accused of slander, leasing-making, and depravation of the laws; but after the king's letter came to hand, authorizing the procedure which was intended, the charge was altered, and he was indicted before the Court of Justiciary for high treason and perjury. The conduct of the prosecutors in every part of it, shewed that there was a determination to cut him off. The plainest maxims of justice were violated without remorse; and a degree of zeal was exhibited to procure his condemnation, which was altogether indecent even in those times of violence and oppression. The earl requested that Sir George Lockhart, his ordinary advocate, might be allowed and authorised to appear in his behalf. This most reasonable petition was refused once and again. About eight gentlemen at the bar, eminent for their talents and character, gave a written opinion, in which they declared that the earl's explanation of the test contained nothing illegal or criminal; and this was taken so heinously amiss, that it was made a matter of formal consultation whether those lawyers should not be prosecuted for scandal against the government. Argyle delivered a speech in his own defence, and offered two letters, one of them from the king, and the other from Middleton, in proof of his loyalty and faithful services, requesting them to be read and recorded in process; but the court would not allow them to be recorded after they were read, plainly because they went far to invalidate the interpretation put upon his conduct with regard to the test. After pleadings were heard at great length, the judges deliberated on the relevancy of the indictment, and it so happened that they were equally divided on that point, while the presiding judge declined giving his casting vote: but they were relieved...

and endeavoured to accomplish by force what he could not hope to obtain by gentler means. To this proposal he readily acceded. It was not against his own country, but in its behalf, that he was about to take up arms. It was to maintain the cause of civil and religious liberty—of justice and humanity—of patriotism and of truth; it was to restore a constitution which had been destroyed by its lawless and savage administrators; it was to give back to the people of Scotland those rights of which they should never have been deprived; and to re-establish the connection which he and his followers naturally had with that kingdom, and which had been dissolved by the hand of unprincipled violence. These were the views which actuated the breast and sanctified the conduct of Argyle, in that rebellion, as it has been called, by a very ordinary misnomer, which he directed against the government of King James. But it did not please Providence at that time to crown the efforts of patriotism with success. The skill of Argyle’s management, indeed, was not equal to the excellence of his object and the purity of his intention. Many untoward and unforeseen circumstances occurred to thwart his plans. Of the people from whom he looked for active and zealous assistance, but who were now greatly dispirited by the harsh treatment they had experienced, much fewer joined him than he had reason to expect. His measures were even disconcerted by the refractory temper of those who, though under his command, were yet too essential to his success to have their opinions slighted. The Duke of Monmouth, too, who engaged to make a similar attempt in England, conducted himself weakly and imprudently, and this tended to throw discredit on the corresponding movements in Scotland, and to render the accomplishment of their united purpose impracticable. The whole enterprise failed almost as soon as it commenced. Argyle was taken prisoner in the neighbourhood of Paisley. He was immediately carried to Glasgow; and from that, in a few days, to Edinburgh. The manner in which he was compelled to enter that city was most ignominious. More disgraceful treatment could not have been given to the vilest criminal; but at that period it was the wise and the good who chiefly suffered, and great personal merit seemed to be almost uniformly the signal for persecution and death. The Earl’s fate was speedily fixed. It was indeed a subject of deliberation, whether he should be punished according to his former sentence, or in consequence of a new trial and conviction. But it was decided without any hesitation, that he should be put to death; and, as if it had been to shew how utterly the rulers of the country at that time set all the maxims of law and justice at defiance, and how much they disregarded the opinions of the world and of posterity, they condemned him to die on the sentence pronounced against him in 1681, which nobody could justify or defend, instead of impeaching him for taking up arms against the government, which was at least a plausible ground of accusation. The Earl bore his fate with all the composure and magnanimity of a Christian. He was beheaded at the Cross, on the 30th of June 1685, and both in his whole behaviour, and in the speech which he delivered on the scaffold, gave a most unequivocal testimony to the truth and power of religion. Of his deportment on
that interesting occasion, Wodrow has given a very
particular and affecting account, which is highly
worthy of the reader's perusal, and of which he
may also see a beautiful abridgment in Fox's History
of the Reign of James II. See Wodrow's History
of the Sufferings of the Church of Scotland; Bur-
net's History of his own Times; Scots Misc cleared
up; Original MSS. in the possession of Mr. Black-
wood, Bookseller, Edinburgh. (x)

CAMPBELL, GEORGE, D.D. was born at Aber-
deen, on the 25th of December 1719. His father, who
was one of the ministers of that city, died suddenly
in 1728, and left his family, consisting of three sons
and three daughters, in circumstances not very af-
fuent. This event, which at first bore an unfa-vour-
able aspect on the future fortunes of young George,
proved advantageous to him, by the necessity of per-
sonal exertion which it imposed, and by the early
and powerful stimulus which it gave to the innate
energies of his mind. He studied the languages at
the grammar school and university of his native
place. In the former, the Latin tongue was taught
with great ability, and in the latter, a taste and
zeal for Grecian literature had been happily intro-
duced by Professor Blackwell, whose eminence in
that department is well known to every scholar.
George Campbell made great proficiency in both,
and thus laid the foundation of that critical erudition
by which he was afterwards so much distinguished.
At first he intended to follow the profession of a
lawyer, and actually served an apprenticeship with a
writer to the signet in Edinburgh. But, from what
cause it is not known, he soon abandoned that view,
and began to qualify himself for the clerical office.
The short time, however, which he spent in study-
ing law was attended with advantage, as it furnished
him with a general knowledge of that important
subject, accustomed him to closeness and ingenuity
of reasoning, and gave him the faculty of drawing
up papers with accuracy and skill. And though in
making these acquisitions he had been tempted to
neglect his Greek, yet he soon recovered what he
had thus lost, when exertion and application became
necessary. Having attended the theological classes,
both at Edinburgh and Aberdeen, during the requi-
site number of years, and having undergone the pro-
bationary trials prescribed by the laws of the church
in such cases, he was licensed to preach the gospel
by the presbytery of Aberdeen, on the 11th of June
1746. In the following year he was a candidate for
the parish of Fordoun, but for reasons which it is
unnecessary to mention, he did not succeed in the ap-
plication. Another year, however, did not elapse,
till he received preferment. In 1748, he was ordain-
ed minister of Banchory Ternan, in the presbytery of
Kincardine-o-niel, which living he obtained through
the generous and disinterested patronage of Sir Alex-
ander Burnett of Leys. In this parish he was chiefly
distinguished by his powers of lecturing or expounding
the scriptures, a practice which forms a regular
part of the service observed in the church of Scot-
land, and has been found extremely useful in pro-
moting the religious knowledge of the people. And
it was while engaged in this important and laudable
exercise among the humble rustics over whom he was
set, that he first entertained the great design which
he afterwards so ably and happily executed, of giving
a new translation of the gospels. It is curious also
to observe, that in this country parish, where scarce-
ly any thing could occur to draw his attention to
the niceties of grammar and the beauties of compo-
sition, and where all his ordinary duties and pursuits
were rather hostile to metaphysical investigations, he
composed a great part of his acute and excellent
work on the Philosophy of Rhetoric. Here, too, he
entered into a matrimonial union, by marrying Miss
Grace Farquharson of Whitehouse, a lady of good
understanding and amiable dispositions, who uniform-
ly and minutely attended to his comfort, and who was
happily spared to him till a very few years before
his death.

In 1757, he was translated to Aberdeen, and be-
came one of the city ministers. This new situation,
in which he had easy access to books, enjoyed the
opportunity of associating daily with literary men,
and lived in the immediate neighbourhood of two
universities, which held out to him objects of ambi-
tion and of hope, stimulated him to greater efforts,
and led him on to higher attainments than he could
have been expected to make in the narrow sphere to
which he had been hitherto confined. Accordingly
we find him more active in the pursuit of knowledge,
and more successful, both in the acquisition and ap-
plication of it. While he did not neglect the pecu-
lar duties of his profession, and was especially so at-
tentive to one branch of these, as to establish, and
even increase his reputation as an expositor of holy
writ, he allowed his studies to take a wider range,
and began to cultivate, with equal diligence and suc-
cess, the taste which he already indulged for litera-
ture and philosophy. About a year after his set-
tement in Aberdeen, a society was formed, which af-
forded him the means at once of improving his mind
and displaying his talents. This society will be deem-
ed worthy of record, when it is recollected that its
leading members consisted of such men as Campbell,
Reid, Gregorv, Gerard, and Brattie, and that in it
were first conceived, and partially produced, many
of those writings by which these eminent men have
done honour to themselves and service to mankind.
Its constitution was well calculated to sharpen the
intellect, to elucidate truth, and to ameliorate the
social dispositions. Instead of that stiff formal
procedure, common in such associations, which obli-
ges the mind either to remain at rest, or to move in af-
fected dignity, there was a spirit of freedom which
expressed itself rather in easy conversation, than al-
ternate debate, and combined pleasure with advan-
tage. And in room of that party temper which
sometimes takes possession of learned bodies, sacri-
ficing truth and harmony and every thing else to its
own contracted views, and converting a season pro-
fessedly devoted to intellectual and social intercourse
into an occasion of indulging illiberal feelings and
angry passions, there was a predominance of good
will and affection, which rendered the discussion of
the gravest points agreeable, and invested philosophy
with that moral charm and influence which should
always grace her. At the meetings of this society
a great variety of subjects were handled, into all of
which Mr Campbell entered with his characteristic
acuteness; and he himself delivered some very inge-
nious essays on rhetoric, criticism, and other topics
to which his attention had been particularly directed.
He was made principal of the Marischal College in 1759. This preferment he owed to the patronage of the Duke of Argyle, (then the minister for Scotland,) to whom he applied for it by letter, and who, in consideration of his relation to that noble family, as well as of his acknowledged merits, procured the situation for him in preference to other two candidates of no inconsiderable pretensions. Hitherto he had published nothing but a sermon preached before the synod of Aberdeen in 1752, on the character of a minister as a teacher and pattern; and he himself thought so little of it, as to exclude it from the collection of sermons which he made a short time before his death. In 1760, he was appointed to preach a second time before the synod of Aberdeen, and on that occasion he delivered a discourse on miracles. This he was requested to publish, and he agreed to do so after having moulded it into the form of a dissertation. As his object was to controvert the unsound and dangerous positions of Mr Hume, he bestowed the greatest care on this performance. He submitted the manuscript first to the Rev. Dr Blair in Edinburgh, and then to Mr Hume himself. By these gentlemen, one of whom was his friend and the other his opponent, he was favoured with various remarks, of which he very candidly took advantage, for the purpose of improving his work. Mr Hume complained that in some cases he had used harsh expressions, pointed out certain misapprehensions of his meaning, and stated objections to what Mr Campbell had advanced. Mr Campbell, with the modesty and ingenuousness which distinguished him, removed what had given offence, either by its real or apparent severity, and at the same time introduced such additional arguments and illustrations as were suggested by the observations of Mr Hume. Having thus corrected his treatise, he gave it to the public in 1769, previous to which time it had received, without any solicitation on his part, the degree of doctor in divinity from King's College in Old Aberdeen. The Dissertation on Miracles is a work of great ability. The author shews a perfect acquaintance with his subject, detects the sophistry of Mr Hume with much sagacity, exposes all the equivocations of his language, and, in the course of a few pages, overturns the whole fabric of infidelity which that plausible metaphysician had raised, by demonstrating the fallacy of that hypothesis on which it had been built. Indeed a more masterly or conclusive performance can scarcely be conceived; and, without undervaluing the works of Mr Adams and Bishop Douglas, both of which are excellent, it may be safely asserted, that a careful perusal of Dr Campbell's Dissertation alone, is sufficient to do away all the effect of Mr Hume's reasonings on the subject of miracles. Mr Hume himself was much pleased with it, as he declared, in a private letter which he addressed to the author; and though he did not confess that it was victorious, he yet praised it for the learning and ingenuity which it displayed, and for the civil and obliging manner in which the Doctor had conducted such an interesting dispute. At the same time it should not be overlooked, that he continued to publish his Essay on Miracles mutilated, and unexplained, and defended, sheltering himself, no doubt, under the convenient resolution of never noticing any answers to his writings that might appear, but certainly acting, in this respect, without any of that candid and enlightened regard for truth by which, as a philosopher, he ought to have been actuated. The Dissertation was very favourably received by all who took an interest in those disquisitions which it embraced, and was particularly acceptable to the religious world, who saw in it a complete antidote to the poison circulated by Mr Hume, and in its author a champion for the truth, from whom still greater efforts might yet be expected. It was also soon translated into the French, Dutch, and German languages; and from this time Dr Campbell's name was honoured and respected among all the learned men in Europe.

The twelve years during which he held the offices of principal of Marischal College, and one of the ministers of Aberdeen, were employed by him in a diligent discharge of his professional duties, and in such other studies as his inclination led him to cultivate. He became a proficient in the science of Botany, which he afterwards found useful in the critical illustration of scripture. He improved his acquaintance with the Greek and Latin. He acquired a competent knowledge of the Hebrew. He made himself so far master of French and Italian as to become a critic in these languages. And he made considerable progress in the composition and revision of his work on the Philosophy of Rhetoric.

In 1771 the town council of Aberdeen appointed him professor of divinity in Marischal College, in consequence of which he resigned his situation as one of the ministers of the city, though he was still under the necessity of preaching once every Lord's day in one of the established churches. In his new capacity he made great exertions to be useful. He even did more, in the way of lecturing on theology, than the ordinary rules of his office prescribed; and introduced several improvements into the mode of teaching his class, which shewed the soundness of his own judgment, and the zeal with which he laboured for the advancement of his pupils. The same year in which he was raised to the divinity chair, he published a Sermon which he had preached before the synod of Aberdeen, entitled, The Spirit of the Gospel, neither a Spirit of Superstition nor of Enthusiasm. This sermon, which abounds in enlightened views and liberal sentiments, was violently attacked both by Nonjurors and Methodists; but the author did not observe any thing in these attacks sufficiently important or interesting to provoke a reply. He maintained a dignified, not a contemptuous, silence; and his discourse, from its obvious and intrinsic superiority, has survived all the clamours that were raised against it by weak or furious bigots.

In 1776, Dr Campbell published his Philosophy of Rhetoric, in 2 vols 8vo: a work on which he had bestowed the labour of many years, and which reflects the highest honour on his intellectual character. It affords a display of grammatical skill, critical acumen, discriminating taste, and philosophical talent, of which there are but few examples in the republic of letters. Throughout the whole work we discover traces of a superior mind. Those passages are particularly worthy of perusal, in which the author treats of abstraction, on which subject he differs from Dr Reid; of the cause of that pleasure which is derived from the representation of distressing scenes, of
the nature and use of verbal criticism; and of the different sources of evidence, which is perhaps the most valuable portion of the performance, and is certainly equal to any thing which has yet appeared upon the subject. The style of this production, like the style of all his productions, is simple, perspicuous, and precise.

During the same year he preached on the national fast-day, a Sermon on the nature, extent, and importance of the duty of Allegiance. In this sermon he endeavours to shew, that the Americans had no right, either from reason or from scripture, to throw off their allegiance to the British government. But though he reasons with his usual acuteness, it is not with his usual success. There are certain great principles which operate irresistibly on the feelings of a people suffering from oppression, and struggling for liberty, though they may not very readily occur to an orator in the pulpit of an established church; and it is by overlooking these, that the Doctor has so easily arrived at his conclusion. It may be remarked, that while he denies the right of the Americans to assert their independence, he very plainly hints the expediency of having granted it to them from the very beginning. Our government, labouring under a strange infatuation, were neither so just as to admit the claims of right, nor so wise as to yield to the dictates of expediency; and at length they were brought under the imperious necessity of surrendering what they had hitherto withheld; nor is there any reason to think that this event was delayed by Dr Campbell's sermon, although, at the desire of Dean Tucker, with whom the doctor carried on a correspondence, 6000 copies of it were published and industriously circulated in America, to persuade the people there to resume their political chains.

The next sermon which Dr Campbell preached and published, was of a different complexion, and calculated to be far more useful. It was delivered before the Society for Propagating Christian Knowledge: It is entitled, "The Success of the First Publishers of the Gospel a Proof of its Truth," and is certainly a very able performance—illustrating, with great distinctness and force, the argument that Christianity derives from the unifftness of those means by which it was originally propagated, taken in connection with the wonderful success which attended them.

Dr Campbell's hostility to Popery had been repeatedly evinced, and on account of it he had received injurious treatment from some Roman Catholics. His hostility, however, was not blind and indiscriminating. And while he abhorred the corruptions of doctrine which existed in the Church of Rome, he equally abhorred that arrogant temper and persecuting spirit by which she had been long distinguished; and abhorred them, too, for their own sake, not for the sake of that system of error and superstition to which they were more particularly attached. In 1779, therefore, when a bill was brought into Parliament for repealing the penal statutes against Roman Catholics, and when there was such a general and outrageous opposition to that measure maintained in this country, he published An Address to the People of Scotland upon the Alarms that had been raised in regard to Popery; and in this pamphlet, while he explains the nature of persecution, he demonstrates its contrariety to the gospel, and inculcates those tolerant and liberal principles which are dictated alike by true religion and sound policy. Such conduct, of course, exposed him to obloquy; but he had magnanimity enough to despise it, and to remain firm in his attachment to the great cause of toleration. It may be proper here to take notice of a very strange and stupid misrepresentation of Dr Campbell's sentiments with respect to the Roman Catholics, which appears in Mr Good's Memoirs of the Life and Writings of Dr Geddes. In that work, Dr C. is ranked among the bigots of Scotland, who opposed the repeal of those penal laws to which the Catholics were subjected, and is even said to be the author of a tract in which that opposition is vindicated. The fact is, that Dr Campbell was an avowed and strenuous friend to the repeal; and the tract just mentioned bears on its title-page, that it was written in answer to his address to the people of Scotland in behalf of that measure. Such a gross blunder on the part of Mr Good is altogether unaccountable, except on the supposition that he wrote without any attention to the accuracy of his statements. In the same year, Dr Campbell published a sermon preached at the assizes at Aberdeen, on The happy Influence of Religion on Civil Society. This subject, which is rather a trite one, he has discussed with great precision, and with some originality. Indeed, the excellence of this and others of his discourses which have been published, makes it a matter of regret that the world has not been favoured with a more copious collection.

The last work which he published was, The Four Gospels, Translated from the Greek, with Preliminary Dissertations, and Notes Critical and Explanatory. It appeared in 1789, in 2 vols. 4to. Of this production it is not easy to speak in too high terms. It must be considered, and is actually considered by all who are capable of forming a judgment, as a most important acquisition to the library of the biblical student. The translation is well executed; and though it unquestionably is in several respects inferior to the common version, yet the more it is read and studied, the more will it be admired. It is wonderfully free, as might have been expected in the productions of such an author, from the undue influence of system, and is frequently very happy in throwing light on what was formerly obscure, and in giving a meaning to what was formerly unintelligible, by the simple alteration of a word or a phrase. Dr Campbell, however, intended rather to call the attention of mankind to a new translation, than to exhibit his own as faultless. The Notes are extremely valuable—not so much for the extent of learning, as for the judicious application of that learning to the elucidation of scripture, which they uniformly display. Some of them are master-pieces of annotation. The Preliminary Dissertations contain some of the ablest critical discussions that are any where to be found. They are marked by a thorough acquaintance with the original scriptures; by an exercise of judgment at once discriminating and profound; by a perfect knowledge and a sound application of the canons of criticism; and by that perspicuity of statement, and that simplicity of style, which are necessary to give the other properties their full effect.

In 1791, Dr Campbell was seized with a violent
illness, and his life was despaired of. On this occasion, he gave a testimony to Christianity, which it is proper to record: “God has been pleased,” said he, “to give me some understanding of his promises in the Gospel of his Son Jesus Christ. These I have communicated to others in my life. I now entertain the faith and hope of them, and this may be considered as the testimony of a dying man.” Contrary to all expectation, he was restored to the capacity of engaging in his former duties and studies. After labouring for four years longer, having lost his wife whom he tenderly loved, feeling himself inadequate, from age and infirmity, to the vigorous and multifarious exertions which his several offices required, and satisfied that he was to be succeeded by a person who was every way qualified to fill the situations from which he was to retire, he resigned them all in the year 1795, in favour of Dr W. Lawrence Brown, with whom he soon acquired habits of intimacy, and with whose appointment he frequently declared himself highly pleased. He received from government a pension of £300 a year; a mark of public respect and gratitude which gave him uneffaced satisfaction, but which he did not live long to enjoy. On the 31st of March 1796, he was affected with a stroke of palsy, which deprived him of the power of speech, and seemed to deaden all his sensibilities. He languished under it for some time, and died without pain, leaving behind him a reputation for piety and worth, talents, learning, and usefulness, of which there are not many such examples in the history of the church. In private life, he was sincere, affectionate, and friendly. His manner, in company, was unassuming and mild; his conversation lively, agreeable, and instructive. By the few whom he honoured with peculiar confidence and intimacy, he was remarkably beloved. All who were acquainted with him, paid him the willing homage of esteem and veneration. In him the sternest and the gentler virtues were happily united: he owed by his unbounded regard to integrity and truth, and he delighted by his affability and condescension. He belonged to what is called the moderate party in the church, but he was truly moderate. No entreaty on the part of his ecclesiastical friends could prevail upon him to become Moderator of the General Assembly; and no consideration could ever prevent him from speaking and acting in church courts, or in any other place, agreeably to his own independent views. He had too much candour to be the leader, and too much elevation of mind to be the adherent, of a party.

Since his death, several works which he left in manuscript have been given to the public. These are his Lectures on Ecclesiastical History, which are thought by many to be latitudinarian in their views of church government, and have been the subject of much able and angry criticism—his Lectures on Systematic Theology and Pulpit Eloquence, in which, with a great deal of sound and judicious remarks, there appears to be a portion of unreasonable prejudice against systems of divinity—and his Lectures on the Pastoral Character, which seems to be the most feeble and most faulty of the Doctor’s productions, and might with great propriety have been suppressed by the editor. (r)

CAMPBELL TOWN, or as it is vulgarly written, Campbellton, a royal burgh of Argyllshire, is situated on the east coast of Kintyre, within twelve miles of the extremity of that long peninsula. Before it received its present name, about a century ago, in honour of the Argyll family, its proprietors and benefactors, it was called Kinloch (Loch-end), and Ceanloch Chille Cirrain, in allusion to its position at the extremity of Kilkerran loch. This fine bay, which extends into the country above two miles, in the form of a crescent, is the harbour of Campbell-town. Being completely sheltered on every side by high grounds, it affords security in all weathers, the insulated rock at the entrance effectually breaking the swell. This natural harbour is two miles long and nearly one in breadth, having a depth of from 6 to 11 fathoms, and the best holding ground imaginable. The town itself, which is situated at the western angle of the bay, presents nothing particularly striking to the view; though, from the high grounds in the vicinity, there is one of the grandest prospects in the world. On the east you have the whole Frith of Clyde, covered with ships; at the distance of 12 miles the island of Arran stretches out before you; a little further to the south is the stupendous rock of Ailsa, rising out of the water in the form of a sugar loaf; beyond, at a vast distance, are the blue mountains of Ayr and Galloway; and looking in the opposite direction you see the north of Ireland, some of the western isles, and the immeasurable expanse of the Atlantic.

Dr Smith, in his Statistical Account, asserts, that here was the first establishment of the Dalriads, those Irish adventurers, who are said, in the sixth century, to have re-established the Scottish monarchy; and, as a proof of this, that one of the adjacent villages is still called Dalruidain. This is not the place for discussing the doctor’s theory, nor inquiring whether the Dalriads had any town at all. One thing, however, is certain, that there is not one vestige existing of a Scottish capital in this place; the most ancient building remembered being a castle of the MacDonals of the Isles, which occupied the spot on which one of the churches now stands. We know little more of the history of Campbelltown than, that in the 17th century, it was already a considerable fishing village; that in 1701, it was erected into a royal burgh; and that in 1755, according to the returns made to Dr Webster, the whole parish, town, and country, contained a population of 4597 souls. In 1791, the inhabitants amounted to 8700; of whom the town contained nearly 5000. The population of the town has been rapidly increasing within these last ten years, its present numbers (1812) being above 6000.

The inhabitants of Campbelltown and the neighbouring district, consist of two distinct races; the Gael and the Goil, or Highlanders and Lowlanders. About 200 years ago, a colony of the latter was invited from the opposite coast to settle here by an earl of Argyll, who, at the same time, that he afforded a comfortable asylum to an oppressed people, obtained a tenantry for his arable lands, far superior to the indolent natives. No Jews ever preserved their original character more distinctly among a strange people than these Lowlanders have done. Though never amounting to a number equal to one third part of the town, they were not情形, and his life was despaired of. On this occasion, he gave a testimony to Christianity, which it is proper to record: “God has been pleased,” said he, “to give me some understanding of his promises in the Gospel of his Son Jesus Christ. These I have communicated to others in my life. I now entertain the faith and hope of them; and this may be considered as the testimony of a dying man.” Contrary to all expectation, he was restored to the capacity of engaging in his former duties and studies. After labouring for four years longer, having lost his wife whom he tenderly loved, feeling himself inadequate, from age and infirmity, to the vigorous and multifarious exertions which his several offices required, and satisfied that he was to be succeeded by a person who was every way qualified to fill the situations from which he was to retire, he resigned them all in the year 1795, in favour of Dr W. Lawrence Brown, with whom he soon acquired habits of intimacy, and with whose appointment he frequently declared himself highly pleased. He received from government a pension of £300 a year; a mark of public respect and gratitude which gave him uneffaced satisfaction, but which he did not live long to enjoy. On the 31st of March 1796, he was affected with a stroke of palsy, which deprived him of the power of speech, and seemed to deaden all his sensibilities. He languished under it for some time, and died without pain, leaving behind him a reputation for piety and worth, talents, learning, and usefulness, of which there are not many such examples in the history of the church. In private life, he was sincere, affectionate, and friendly. His manner, in company, was unassuming and mild; his conversation lively, agreeable, and instructive. By the few whom he honoured with peculiar confidence and intimacy, he was remarkably beloved. All who were acquainted with him, paid him the willing homage of esteem and veneration. In him the sternest and the gentler virtues were happily united: he owed by his unbounded regard to integrity and truth, and he delighted by his affability and condescension. He belonged to what is called the moderate party in the church, but he was truly moderate. No entreaty on the part of his ecclesiastical friends could prevail upon him to become Moderator of the General Assembly; and no consideration could ever prevent him from speaking and acting in church courts, or in any other place, agreeably to his own independent views. He had too much candour to be the leader, and too much elevation of mind to be the adherent, of a party.

Since his death, several works which he left in manuscript have been given to the public. These are his Lectures on Ecclesiastical History, which are thought by many to be latitudinarian in their views of church government, and have been the subject of much able and angry criticism—his Lectures on Systematic Theology and Pulpit Eloquence, in which, with a great deal of sound and judicious remarks, there appears to be a portion of unreasonable prejudice against systems of divinity—and his Lectures on the Pastoral Character, which seems to be the most feeble and most faulty of the Doctor’s productions, and might with great propriety have been suppressed by the editor. CAMPBELLTOWN.

Campbell-town.

of the natives, with whom they have been all along mixed, they have to this day preserved their own original names, language, minnows, and dress, and retain even some degree of that religious enthusiasm and taste for the scholastic theology, for which Ayr and Galloway were so famous at the period of emigration. It is not 20 years since a prophet arose among them, who published visions and predictions exactly in the manner of Alexander Peden, the famous Gallovidian seer. This distinction of character is much less marked in the town than in the adjoining districts, as the English language is there universally understood, and the more frequent intercourse with strangers has diminished peculiarities. Even there, however, the Lowlanders have their own dissenting meeting-house and minister; and are remarkable for their sobriety, industry, and success. Notwithstanding the remote situation of this interesting little town, being nearly 200 miles by land from Edinburgh, the better classes are remarked for their politeness and intelligence; the females are not above three days in point of fashion behind the ladies of our metropolis; and strangers are not a little surprised to see the numerous and genteel assemblage of both sexes which can be mustered on occasions of festivity. The fact is, that from the establishment of excellent packets plying almost every day from this place to Greenock and Glasgow, the intercourse with the Lowlands is scarcely affected by the distance. The proportion of poor people is here very great, consisting of the widows and orphans of sailors, of whom several perish annually; of indigent families, who come in from the country for incidental employment; and of swarms of professed beggars, who lay the whole peninsula under contributions.

The antiquities of this place are not numerous, the only object of the kind within the town being a handsome cross, with a half obliterated inscription in Gothic characters, brought, it is said, from Iona. In taking a short walk to the westward of the town, you pass by the two batteries which defend the harbour, and arrive at Kilkerran, a most romantic sequestered spot. In the middle of the burying ground are seen the ruins of the chapel dedicated to St Kerran, who was one of the first Christian missionaries. A little further on are the remains of a castle built by James V. during his visit in these parts, to overawe the Macdonalds; but before his majesty had well left the harbour, the garrison, it is said, was taken, and the governor hanged over the walls. Turning to the south you observe some great caves in the rocks which face the Frith. One of them contains, on all sides, a range of natural seats; another, which was the residence of St Kerran, is in the form of a cross, and has three fine Gothic porticoes. On the floor of this cave is the figure of a cross, together with a circular basin, cut out of the rock, and full of sweet water; from which the saint of old derived his salubrious beverage.

The town is governed by a provost, two bailies, a dean of guild, and a council; is the seat of the presbytery of Kintyre; and returns a member of parliament, in conjunction with Inveraray, Ruthsay, Ayr, and Irvine. Having no landed property, its funds depend entirely on dues levied on commodities from the country, on harbour dues, the rents of a mill, and church seats; for the receipt and management of all which revenues, there is a public treasurer. The parish of Campbelltown, having originally consisted of four distinct parishes, has been consolidated, and comprehends a population of about 9000 souls. For their accommodation, however, there is but one serviceable church, and the Lowland meeting-house. Another church was built some time ago, at a great expense, for the exclusive accommodation of the Gaelic hearers; but owing, it appears, to some absurd miscalculation, the roof has assumed a most threatening attitude. The parish living is divided between two clergymen, each of whom preaches alternately both in English and Gaelic. The public school has two masters, and is in a flourishing condition.

The principal necessaries of life are supplied in the greatest abundance from the vicinity; as potatoes, butter, cheese, beef, and mutton; of all which articles considerable quantities are exported to the neighbouring markets. The quantity of butcher-meat, annually slaughtered for the consumption of the town and shipping, now considerably exceeds 1000 bollacks, and as many sheep. The only necessary of life, of which there is any considerable importation, is oat-meal, which, to the annual amount of 3000 bolls, is brought from the Lowlands and Ireland; but, as the writer of the statistical account justly observes, the people have themselves to blame for this apparent deficiency, upwards of 7000 bolls of grain being every year converted into whisky. Peat continues still to be used as fuel by the poorer people, though a seam of excellent coal is worked within a few miles of the town, to which the coals are conveyed by a small canal.

The situation of this peninsula town is admirably well calculated for traffic. The neighbourhood abounding in corn and cattle, provisions are obtained at a reasonable rate; and the navigation to the fishing grounds, to Inverary, Greenock, Glasgow, Ayr, and the coast of Ireland, so extremely short, that a more central position for the coasting and home trade cannot anywhere be found. The herring fishing still continues to be the principal occupation of the inhabitants, of whom above 700 men have been known to be out in one season. During its most flourishing period, the following was an average statement of seven years: 50½ vessels, 30004½ tons, 6746 men, 7412 barrels of herrings. Government fostered with unsparing liberality the infancy of this lucrative trade, from which Campbelltown alone has realised a very considerable capital, perhaps not less than L.60,000 sterling. The herring fishery, however, has of late been found rather unprofitable, and at present not above 2000 tons of Campbelltown shipping are employed in it. The people of capital are now beginning to embark in the foreign and coasting trade. Already more than 1000 tons of shipping are employed by them in these new channels; and, last year (1811), the sum of L.9000 sterling was laid out here in the purchase of vessels, larger and better calculated for general business than the herring busses.

In this place there are but few manufactures. Besides the great distillation of whisky already men-
tioned, the weaving of cotton was introduced some years ago; but with what success we are not informed. Of late, a woollen manufacture has been set a-going by Mr. Clarke, on a pretty large scale; in which the various processes of carding, spinning, weaving, &c. are carried on by the new machinery.

This extensive and laudable undertaking is patronized by the Duke of Argyle, and promises well, as a ready market is found for the cloth in the vicinity, and in Ireland. Campbeltown is situated at N. Lat. 55° 26′, W. Long. 5° 34′. (w)

CAMPDEN, or CHIPPING CAMPDEN, formerly Campedene, a town of England, in Gloucestershire, is situated near the extremity of the county, in a fruitful valley, among cultivated hills and hanging woods. The town consists chiefly of one street, about a mile long. The principal public buildings are, the court house, which is situated about the middle of the street, and seems to have been built about the beginning of the fifteenth century; the market house, which was erected by Sir Baptist Hickes, Viscount Campden, in 1624; and the church, dedicated to St. James, which is supposed to have been built in the reign of Richard I., and which stands on a gentle eminence above the town. It is a large Gothic edifice, and contains some of the finest marble monuments in England. The nave of the church is sixty feet high, with an aisle on each side. The tower at the west end is 120 feet high, and is finished with battlements and 12 pinnacles. The remains of a magnificent mansion, erected by Sir Baptist Hickes, are still to be seen near the church. It was an immense building, adorned with frizes, entablatures, and a profusion of sculpture, and is said to have occupied, along with the offices, a space of eight acres, and to have cost 29,000L. In the neighbourhood of the town there is a silk mill and manufactory.

The Coteswold games were held on Dover hill, about half a mile from the town of Campden. Number of houses in 1801, 255. Population 1219; of whom 694 were returned as employed in trade and manufactures. See Rudder's New History of Gloucestershire, fol. Cirencester, 1779; and Rudge's General view of the Agriculture of the County of Gloucester, Lond. 1897. (w)

CAMPECHE, or CAMPEACHY, from Cam, which in the Maya language signifies serpent, and peche, the little insect (acarus), called by the Spaniards garapata, which penetrates the skin, and occasions a smart pain; a town of America, in New Spain, situated in the intendancy of Merida, on the western side of a bay of the same name, which forms part of the gulf of Mexico. It stands on the Rio de san Francisco, and has a harbour which is large and shallow. The houses are built of stone; it has a good dock, and a fort which commands both the town and harbour. The exportation of the wax of Yucatan is one of the most lucrative branches of trade, but owing to the insecurity of the harbour, vessels are obliged to anchor a good way from the shore. Between Campeche and Merida are two very considerable Indian villages, called Xamapolan and Equetechcan.

The Campeche wood, (Hematoxylop Campechianum,) grows in great abundance in the neighbouring county. An annual cutting (Cortes de palo Campeche,) takes place on the banks of the river Campton, the embouchure of which is south of the town of Campeche, and within four leagues of the small village of Lerona. "It is only with an extraordinary permission," says Humboldt, "from the intendant of Merida, who bears the title of governor captain general, that the merchant can, from time to time, cut down campeche wood to the east of the mountains near the bays of Ascension, Todos los Santos, and El Espiritu Santo. In these creeks of the eastern coast, the English carry on an extensive and lucrative contraband trade. The campeche wood, after being cut down, must dry for a year before it can be sent to Vera Cruz, the Havanah, or Cadiz. The quintal of this dried wood (palo de tinta,) is sold at Camppeche for two piastres to two piastres and a half (from 8s. 9d. to 10s. 11d.). The hematoxylon, so abundant in Yucatan and the Honduras coast, is also to be found scattered throughout all the forests of equinoctial America, wherever the mean temperature of the air is not below 22 degrees of the centigrade thermometer, (71° of Fahrenheit). The coast of Florida, in the province of New Andalusia, may one day carry on a considerable trade in Campeche and Brazil wood, which it produces in great abundance." The habitual population of the town is 6000. West Long. 90° 30′, North Lat. 19° 30′. See Humboldt's Political Essay on the Kingdom of New Spain, vol. ii. p. 247, 248, 249; see also the article BUCCANEERS in this work, vol. v. p. 32, col. 2. (w)

CAMPER, PETER, an eminent anatomist and natural historian, was born at Leyden on the 11th of May 1723. His family had long held a high situation in the magistracy of that city; and his father, Florent Camper, who had for some years been a minister of the gospel at Batavia, and had returned to his native country in 1713, was distinguished by his philosophical and literary accomplishments, and associated with the most learned characters of Leyden. Boerhaave, Gravesande, Muschenbroek, and Moor, were his most intimate friends; and it was in the society of these celebrated men that young Camper spent much of his youth, and from their conversation imbibed that love of science and the fine arts for which he afterwards became so conspicuous. At an early age, Camper was instructed by the famous Moor in the art of designing and painting; a study which, though he had no intention of prosecuting but as an amusement, yet was of the utmost advantage to him in his anatomical researches, as it enabled him to make drawings of such figures and preparations as he wished to have engraved. The plates with which his works are illustrated, are consequently free from many inaccuracies which dependence upon the delineations of others often renders unavoidable. His knowledge of geometry, which he also acquired when young, under the tuition of the celebrated Laborde, proved another useful auxiliary in his future pursuits, and gave a correctness to his elucidations which they could not otherwise have possessed. These studies, however, he soon quitted for more important acquisitions; and, having entered the university of Leyden, he devoted himself in a particular manner to medicine, which soon became his favourite study. The different branches of that science were then.
taught by Gauobius, Van Rooyen, the Elder Albinus, and Trijon; the age and infirmities of Boerhaave having disabled him from attending his public duty in the university, and from becoming the preceptor of the son of his friend. Under these masters, Camper soon rose to distinction; and when he received his degree of doctor in philosophy and medicine in 1746, he published two dissertations,—the one, De Viseo, the other, De Oculi quibusdam partibus, which have both been much praised by Balderin.

Having finished his studies at Leyden, he was now desirous of visiting the different capitals and universities of Europe, and of improving the acquaintance which he had already formed with several of their most eminent literati. But the age and growing weakness of his parents demanding the presence and the tenderest attentions of an affectionate son, prevented for a time the fulfilment of his wishes. This obstacle, however, was, in a few years removed by their death, which happened in 1748; and Camper soon after set out for London. Here he associated with the celebrated physicians Mead, Pringle, Pittcairn, &c. He renewed his medical studies under Hunter, Sharp, Smellie, and Winchester; and his taste for natural history was awakened by his visiting the cabinets of Hans Sloane and Collinson, and the collections of Hill and Catesby. Endowed with an inquisitive and comprehensive mind, his researches were not confined to any particular branch of science. He delighted in the wide range of general knowledge; and examined, with the eye of a philosopher, the different improvements in every department of the arts. He attended the most eminent artists and mechanicians, deriving from each such instructions as were connected with their particular professions; and the improvements in naval architecture engaged a considerable share of his attention. Here, also, his taste for painting was not forgotten; and he even acquired some practical knowledge in the art of engraving. Having spent nearly twelve months in London, zealously engaged in scientific and literary pursuits, he went to Paris in the summer of 1749, where he was introduced to Buffon and some other distinguished characters, and where he remained about two months, visiting the principal public establishments of that capital. He then repaired to Lyons, and from thence to Geneva. During his stay at this latter city, he was appointed professor of philosophy, anatomy, and surgery, at Franeker, which obliged him to hasten his return to Holland. On his journey home, however, he staid a few days at some of the principal cities of Switzerland and Germany. At Basle, he visited Bernouilli; and, in the library of that city, examined the writings of Erasmus, and the paintings of Holbein.

A severe malady with which he was seized at Leyden, during the winter of 1749, prevented him from entering upon the duties of his new office until the following autumn, when he began his prelections with a discourse De Mundo Optimo.† Not content, however, with the knowledge of his profession which he had already acquired, or the connections which he had formed in foreign countries, he revisited London during the vacation of 1752, and a second time attended the lectures of some of its ablest physicians.

At Franeker, Camper continued to teach with increasing celebrity, and was always attended by a numerous audience, until 1755, when he was appointed professor of anatomy and surgery at the Athenaeum of Amsterdam. Here he remained nearly six years; and it was during his residence in that city that he published the first volume of his Demonstrations Anatomico-Pathologicae. But the bustle of the capital, and the wish of Mrs Camper to return to Friesland, determined him to resign his situation in the Athenaeum; and, in 1761, he retired to his country-house near Franeker, still retaining, however, the title of honorary professor in that academy. His whole time was now devoted to the sciences; and he published the second volume of his Demonstrations in 1762.

After remaining two years in his retirement, he was nominated to the professorship of medicine, surgery, anatomy, and botany, in the university of Groningen. The vicinity of this city to his present habitation—the natural activity of his mind—and his love of fame—determined him to accept the situation. During the ten years which he continued a member of this university, his reputation daily increased. Besides many valuable papers on medical subjects, which he presented to the different societies of Europe, he made several important discoveries in natural history; and, during the last years of his residence in Groningen, he gave courses of lectures on medical jurisprudence, which many of his colleagues, the magistrates of the city, and the lawyers, honoured with their presence and approbation. He quitted Groningen with regret; and received, on his departure, the most unequivocal testimonies of affection and esteem from many of the principal inhabitants. He often declared, that the years which he spent in that city were the happiest of his life; and that probably he never would have quitted a society where he was treated with such kindness and respect, had not the desire of Mrs Camper, and his resolution to superintend the education of his children, obliged him to make the sacrifice.

Camper now fixed his residence at Franeker for the education of his children; and, being freed from the labours of public teaching, he devoted himself entirely to his favourite pursuits. His studies, however, were for a time interrupted by the death of Mrs Camper, to whom he was most tenderly attached, and whose estimable qualities, during an union of twenty years, had constituted the chief comfort of his life. Une juste douleur, says his son, detest-
Camper, a pendant long-temps son esprit de toute application aux sciences. To relieve his mind from the pressure of affliction, he made a tour through the county of Bentheim, the duchy of Cleves, and Brabant. The paintings of Rubens, Vanderlyke, and the other great masters of the Flemish school, which he found at Antwerp and Brussels, fixed his attention for a while in these cities, and afforded him some moments of relaxation; and, in the following summer, he went to Paris, where he was delighted with the society of Franklin, Marmontel, Diderot, &c. He afterwards visited some of the principal cities in Germany, and associated with the most celebrated authors of that country. At Potsdam he was presented to Frederic the Great, who received him with great affability and respect; and, on his return, he had the honour of spending two days with his brother, Prince Henry of Prussia, at Rhynsberg. The researches of Camper were now more directly to natural-history; and every year added to his fame as an author and a philosopher. His studies, however, important and multiplied as they were, did not prevent him from taking a part in the public affairs of his country. He was twice elected a representative in the assembly of the province of Friesland; and, in 1763, he was appointed councillor of the city of Workum, which entitled him to a seat in the college of the admiralty of Friesland. In 1787, he was nominated one of the council of the state, which obliged him to remove his place of residence to the Hague, and where he continued till his death, which was occasioned by a violent pleurisy, on the 7th of April 1789. His body was deposited in the tomb of his ancestors, in the church of St Peter at Leyden.

The writings of Camper contain many important discoveries both in medicine and in natural history; and though he has published no work of considerable magnitude, yet, in the various memoirs which he has presented to the different learned societies with which he was connected, he displays great strength of reasoning and aptness of illustration. As he derived his knowledge more from observation than from books, he was always furnished with a multiplicity of facts to bring in support of his positions; and the clearness of his expressions and illustrations arose from the abundance of his resources. Camper was personally acquainted with the most celebrated authors of the age, and had been instructed by their conversation as well as by their works. It was his constant practice, while travelling, to keep a journal, in which he recorded every thing which he either heard or saw that was worthy of being known;—the appearance and nature of the country, and the systems, projects, and errors, both of philosophers and artists. He took drawings of every rare object in anatomy or natural history which he met with; and some of his journals contain a variety of useful and curious observations on agriculture, manufactures, and the form and composition of mountains.

Camper wrote upon every subject of medicine or surgery which was under public discussion during his time; and carried off the prize on several questions proposed by some of the learned societies on the Continent. He was also a member of many of those societies; and their memoirs were enriched by his valuable communications. Besides his Demonstrations Anatomico-Pathologicae, of which two parts only appeared, the one containing the structure and diseases of the human arm, the other the structure and diseases of the human pelvis,—he published separate dissertations upon the following subjects:— "On the cause of hernia in new-born children,"—"on the sense of hearing in fishes,"—"on the physical education of children,"—"upon inoculation for the small-pox,"—"upon the origin and colour of the negroes,"—"on the signs of life and death in new born children,"—"on infanticide, with a project for the establishment of a foundling hospital,"—"on the causes of infanticide and suicide,"—"on the introduction of air into the lungs of new-born children,"—"on the operation of lithotomy at two different times, according to the celebrated Franco,"—"on ulcers in the urethra, &c."—"upon the orang-outang and other kinds of apes,"—"upon cancers,"—"upon lameness in infants,"—"upon lithotomy,"—"upon the classification of fishes according to the system of Linnaeus,"—"and "upon the fracture of the patella and olecranon." He also presented the following memoirs to different societies; viz. "Upon the calculus of fractured bones,"—"upon the advantages and best methods of inoculation for the small-pox,"—"upon the theory and treatment of chronic diseases of the lungs, &c."—"upon the construction of bandages for hernia, and the best method of tempering steel used for these instruments,"—"upon the structure of the great bones of birds, and the manner in which atmospheric air is introduced into them"—"upon the cure of ulcers,"—"upon the characteristic marks of countenance in persons of various countries and ages," which was afterwards published by his son in quarto, in 1791, and followed by the description of a method of delineating various sorts of heads with accuracy,—"upon the discovery of the glands in the interior of the sternum,"—"upon contagious diseases among cattle,"—"upon specific remedies,"—"upon the effects of air, sleep, &c., in the cure of surgical disorders,"—"upon the nature, treatment, &c. of dropsy,"—"upon physical beauty,"—"upon the question, Why is man exposed to more diseases than other animals?"—"and "upon the fossil bones of unknown and rare animals." After his death, his son, M. Adrian Giles Camper, published in 1792 a sequel to his "Treatise on the natural difference of Features," &c. entitled, "Lectures of the late Peter Camper on the manner of delineating the different emotions of mind in the Countenance; on the striking resemblance between Quadrupeds, Fowls, Fishes, and the Human Species; and on the constituent Beauty of Form." In the year 1803 a collection of his works appear—

* The discovery of this curious structure was first made by Camper in 1771. It has, however, been claimed by M. Hunter of London; but with what justice, it is difficult to conceive, as that gentleman's paper upon this subject was not read to the Royal Society until Feb. 1774.
ed at Paris in 3 vols. 8vo. with a folio atlas of plates, under the title of "Œuvres de Pierre Camper qui ont pour objet l'Histoire Naturelle, Physiologie, et l'Anatomie Comparée," to which is prefixed, "An Essay on his Life and Writings" by his son; and two eulogiums; viz. one by Vicq. d'Azay, and the other by Condorcet.

If the abilities of Camper as a philosopher entitle him to our respect and admiration; the better qualities of his heart call for our esteem. He was distinguished by his domestic and social virtues, and performed the duties of a son and of a father with the most affectionate solicitude. He often sacrificed his own inclinations to the wishes of his aged parents, and sweetened their declining years by his presence and tender attention. Though his literary labours occupied much of his time, yet the education of his children was always his favourite employment, and we cannot better conclude this sketch of his life than with the affectionate testimony of his son: "Les tendres soins de mes parents pour mon bonheur, leur douce et franche intimité, mille et mille biensfaits dont ils m'ont comblé depuis le jour de ma naissance jusqu'à l'instant ou un meilleur monde est devenu leur partage, rappelleront sans cesse a ma mémoire ces paroles admirables de la doctrine des Chinois: Qu'on ne saurait survivre a un père, a une mere, que pour les plier chaque moment de la vie."

(p)

CAMPHOR is a substance contained in many vegetables, and is of extensive use in the materia medica. The camphor of commerce is obtained from the laurus camphora, a forest tree which abounds in Borneo and Sumatra. It is found in perpendicular veins, near the centre of the largest and oldest trees, from which it is picked out by means of knives. It is generally procured, however, by sublimation. Small pieces of the stem and branches of the tree are put into an alembic, to the head of which is adapted a capital, containing straw. When exposed with a little water to a moderate heat, the camphor is volatilized, and attaches itself to the straw.

Camphor is also obtained by sublimation from another species of laurus, which grows in Japan; but this kind is not so much esteemed in the East as that which is obtained from Sumatra and Borneo. Camphor is likewise procured from the Laurus cinna-momum, the Laurus Sassafras, the Laurus Cassia, the Maranta Galanga, the Kaempferia rotunda, and the Asarum European; ginger, the seeds of cardamom, and long pepper; and from the essential oils of juniper, sage, hyssop, thyme, peppermint, rosemary, and lavender. See Asiatic Researches, vol. iv. p. 19; Phil. Trans. 1805; Nicholson's Journal, vol. x. p. 132; Collect. Academ. Part. Etr. tom. xiii. p. 43; Disc. Prelim. et Part. Franc. tom. ii. p. 206—223; and the Journal de la Blancheerie, 1785, p. 393. See Chemistry and Materia Medica. (a)

CAMPNOROSMA, a genus of plants of the class Tetrandria, and order Monogynia. See Botany, p. 90; and Brown's Promus Plant. Nov. Holls, p. 290.

CAMUS, CHARLES ETIENNE LEWIS, a celebrated French mathematician, was born at Cressy in Brie, on the 25th of August, 1699, and was the son of Etienne Camus, a surgeon of that place. At a very early age he displayed a great attachment to mechanical pursuits, and while his companions were amusing themselves at play, he was often found constructing some machine, with no other instrument but a knife. Before the eleventh year of his age, he felt such a passion for mathematical learning, that he entreated his parents to send him to the college at Paris; but from the narrowness of their circumstances, they at first hesitated about the prudence of such a step; and it was only from a well founded confidence in the wisdom and talents of their son, that they at last resolved to send him to the college of Navarre.

In a short time Camus became one of the best scholars at the college; and at the end of two years he was able to give lessons in mathematics, and thus to defray all the expences of his education.

Under the care of the celebrated Varignon, Camus applied himself to the study of the higher branches of mathematics, and he at the same time directed his attention to the subjects of civil and military architecture, mechanics, and astronomy. His knowledge of these subjects gained him the acquaintance and friendship of M. de Cotte, Couplet, and Cassini, and paved the way for his introduction into the academy of sciences. In the year 1727, that learned body having proposed as the prize subject, "The best method of mastng vessels," Camus entered the lists, and had the good fortune to be among the number of those whose memoirs on this subject were published by the academy in the Recueil des Prix.

In consequence of this proof of his talents, Camus obtained, on the 18th August 1727, the place of adjunct mechanician, vacant by the promotion of M. Pitot. In the year 1728, he wrote a memoir on accelerated motion by living forces, a subject which was then agitated with much heat. On the 16th December, 1730, the academy of architecture appointed him professor of that science; and in 1733, he was honoured with the office of secretary to the same academy. He obtained the degree of associate to the academy of sciences on the 18th of April, 1733. On this occasion the celebrated Clairaut was his competitor, and appeared upon counting the votes to have a majority of one in his favour. It was imagined, however, that some mistake had been committed in taking down the votes, and in consequence of this suspicion, the king, at the request of the academy, nominated both the candidates.

In the year 1736, Camus was sent along with Clairaut, Maupertius, and Monsieur, to measure a degree of the meridian at the north polar circle. During this operation, which was completed in 1737, Camus rendered himself highly useful, not merely as an astronomer, but as a mechanician and an artist; and to his address and genius the operation owed a great part of its success.

When M. Mairan succeeded Fontenelle as secretary to the academy, Camus was appointed, on the
CAMUS.

18th January 1741, to the situation of pensioner-
geometrician held by that learned philosopher. In
the same year, his attention was directed to the sub-
ject of measuring the capacity of vessels for contain-
ing liquids; and he invented a gauging-rod and slid-
ing-rule for calculating the contents of casks of every
form. In 1746, Camus found a difference be-
tween the length of the standard ell, and that which
was fixed by law; and the academy he was consulted
on this subject, he was appointed, along with M.
Hellot, to examine it. The cause of the difference
was soon discovered, and likewise the reason why
the ell was not composed of any aliquot parts of the
toise. In 1747, Camus published a memoir on the
tangents of points common to several branches of the
same curve; and, a short time afterwards, he was
appointed to the place of examiner of the schools of
engineers and artillery. In this new situation, his
time was much occupied by travelling, but he still
found leisure to compose a complete course of ma-
thematics for the use of the engineers, which ap-
peared at different times, in 4 volumes 8vo.

In 1756, Camus was one of the eight academi-
cians who were appointed to examine, by a new mea-
surement, the distance between the centres of the
pyramids of Villejuifve and Juvisy, which had for-
merly been measured by Picard; and he has given
a full account of this operation in the Memoirs of
the Academy for 1754.

Camus married, in 1733, Mademoiselle Fournier,
by whom he had four daughters, only one of whom
arrived at maturity. This lady, whom her father
loved with the most unusual tenderness, was married
to M. Pagin, treasurer to the Count de Clermont.
In the rigorous winter of 1766, Camus caught a
severe cold in his breast during his travels to exa-
mine the schools of artillery; and his health had just
been re-established by M. Petit, when the death of
his only daughter, on the 4th December 1767, oc-
casioned a relapse. After this distressing event, his
health gradually declined, and he expired on the 4th
of May 1768, in the 69th year of his age.

M. Camus was above the middle size, and was dis-
tinguished by the frankness of his manner, and by
an unyielding integrity of character. He left be-
hind him a great number of manuscripts, among
which were, treatises on the various subjects of Dial-
lng, Mechanics, the Differential and Integral Cal-
culus, Algebra, Hydraulics, Conic Sections; Per-
spective; on the Division of Time, and the Ma-
achines which are employed to measure it; on the
Toise; on Vaults; on Winches; on Practical Geo-
metry; on the application of Algebra to Geo-
metry; on the Mines of Sweden.

The following is a complete list of the writings of
Camus:

1. Cours de mathématiques à l'usage des Ingé-
nieurs. Paris, 4 vol. in 8vo.
2. Éléments de mécanique.
3. Éléments d'arithmetic.
4. Du mouvement accéléré par des ressorts et des
forces qui résident dans les corps en mouvement.
See Mem. Acad. 1728, p. 159. Hist. 73.
5. Solution d'un problème de géométrie de M.
Cramer. Id. 1732, p. 146.
6. Observations sur la figure des dents des roues,
et des ailes des pignons pour rendre les horloges plus
parfaites. Id. 1733, p. 117. Camus afterwards dis-
cussed this important subject at greater length in the
10th and 11th books of his Cours des Mathematique.
7. Obs. sur l'action d'une balle de mouquet, qui
perce une pièce de bois d'une épaisseur considerable,
sans lui communiquer de vitesse sensible. Id. 1738,
p. 147, H. 98.
8. Obs. sur la meilleure manière d'employer les
seaux pour clever de Peau. Id. 1739, p. 157, H. 49.
9. Obs. sur les meilleures proportions des pompes,
et des parties qui les composent. Id. 1739, p. 297, H.
49.
10. Problème de statique. Id. 1740, p. 201, H.103.
11. Obs. sur un instrument propre à jauger les
tonneaux, et les autres vaisseaux qui servent à con-
tenir les liqueurs. Id. 1741, p. 385, H. 105.
12. Obs. sur l'étonal de l'aune du bureau des Mar-
chands Merciers de la Ville de Paris. Id. 1746,
p. 607, H. 108.
13. Obs. sur les tangentes des points communs a
plusieurs branches d'une même courbe. Id. 1747,
p. 272.
14. Obs. sur les opérations faites par ordre de l'
Académie pour mesurer l'intervalle entre les centres
des pyramides de Villejuifve et de Juvisy, en conclure
la distance de la tour de Montlhéry au clocher de
Brice-Comte-Robert et distinguer entre les différentes

Canada.

Canada, sometimes called New France, or the Province of Quebec, is an extensive tract of country in North America; and is the principal British possession in that quarter of the globe. The relative position of this colony to the United States, and its immense extent of territory; its growing commercial importance, and its ability to supply our West India islands, in the event of interruptions to their intercourse with the Americans; the circumstance of its being hitherto little known to the inhabitants of Great Britain, and of much useful information having been recently acquired respecting it; all these considerations justly entitle it to a much larger space than it has hitherto occupied in works of this nature. The name Canada, in its most extended sense, and especially according to the usage of the French geographers, has been applied to the whole of that immense district, which is comprehended between the 49th and 50th degrees of north latitude, which reaches from the Atlantic to the Pacific ocean, in an inclined direction from north-east to south-west; but, in its more confined acceptance as a British colony, it is computed to extend about 1300 geographical miles, between the 64th and 97th degrees of west longitude; while its breadth, at a medium, is rated at 200 miles, though its greatest width, from Lake Erie on the south, or lat. 43, to lat. 49, is about 360 miles. It is bounded on the east by the Gulf of St Lawrence; on the north, the west, and south-west, by the territories of different Indian nations; on the south and south-east by New York, New England, New Brunswick, and Nova Scotia; but, except on the east, its precise limits are nowhere well defined. Even on the side of the United States, its boundaries are not yet definitively fixed; and have been the subject of much discussion, from the era of American independence to the present day. According to the treaty of peace between the colonies and the mother country, upon the termination of the American war, the line of division was to run from the north-west angle of Nova Scotia—along those high lands which divide the rivers that empty themselves into the St Lawrence, from those that fall into the Atlantic Ocean, to the north-westernmost head of the Connecticut river; along the middle of that river to the 45th degree of north latitude; along the said latitude, due west, till it strikes the river Iroquois or Cataragoy; along the middle of that river, of Lake Ontario, of Lake Erie, of Lake Huron, of Lake Superior, of the Long Lake (which, however, has no existence), and of the Lake of the Woods; thence, on a due west course, to the river Mississippi; and along the middle of that river, till it intersect the northernmost part of the 31st degree of north latitude.

It is divided into two provinces, called Upper and Lower Canada. The former, which is the western division, is situated on the north side of the great lakes, or sea of Canada; and is inhabited chiefly by English settlers. The latter is situated on the river St Lawrence, towards the east, and is peopled by a greater proportion of French inhabitants. The lower province is divided into twenty-one counties; Gaspé, Cornwallis, Devon, Hertford, Dorchester, Buckinghamshire, Richlieu, Bedford, Surrey, Kent, Huntingdon, York, Montreal, Effingham, Leinster, Warwick, Saint Maurice, Hampshire, Quebec county, Northumberland, and Orleans; 17 of which send two representatives each to the Provincial Assembly; and the other four, one each. It contains the following towns, besides a number of large and populous villages:—Quebec, the seat of government, situated on a lofty point of land, on the north-west side of the St Lawrence, nearly 400 miles from its mouth, very strong by nature, and completely fortified by art, contains about 15,000 inhabitants, and sends four representatives to the Assembly:—Montreal, 180 miles above Quebec, built on the east side of an island formed by the junction of the St. Lawrence with the Utawas, the boundary between the two provinces, contains 6000 inhabitants, and also sends four representatives:—Trois Rivieres, or Three Rivers, nearly midway between Quebec and Montreal, formerly a place of great resort to the Indians, contains about 250 houses:—The Borough of William Henry, (so named in compliment to his Royal Highness the Duke of Clarence), situated in the Seigniory of Sorelle, on the south side of the St Lawrence, about 45 miles below Montreal, and which was originally laid out by the surveyor-general of the province, is principally inhabited by American loyalists and disbanded soldiers, who obtained small grants of land at the end of the American war, the Seigniory having about that time been purchased by the crown, in the view of forming a military position at this place; contains upwards of 100 houses, a Protestant and a Roman church, a government-house (the only brick building of any magnitude in the province), and a military hospital: the inhabitants are chiefly employed in ship-building.

In the Upper province, the principal settlements (for they can scarcely yet be called towns), are:—

Kingston, 385 miles above Quebec, near the egress of the St Lawrence from Lake Ontario, which has increased and improved very rapidly since its foundation in 1784, and which contains several commodious dwellings built of excellent stone, a barracks, a jail, a court-house, a church, an hospital, several extensive store-houses, and a naval dock-yard:—York, or Toronto, the seat of government in Upper Canada, and about 450 miles above Quebec, which was laid out as the site of a town only in 1797, and has already made very considerable advancement:—Niagara, or Newmark, at the west opening of Lake Ontario, and about 525 miles from Quebec, a very thriving and beautifully situated town:—Queenstown, about eight miles beyond Niagara, a neat, flourishing place, where all the merchandise and stores for the upper province are landed from the vessels in which they have been conveyed from Kingston, to be transport-
Canada. ed in wagons to Chippawa, or Fort Welland, about ten miles distant, which contains several store-houses, two or three taverns, and a wooden fort, with a garrison of 25 men.

Fort. The principal forts or military postsm, Fort Carlton, a little higher up the river, well garrisoned and fortified, and possessing an excellent harbour; Fort Niagara, situated at the ingress of the St Lawrence into Lake Ontario, and of great importance for the protection of the British Indians; Fort Amherstburgh, between Lakes Erie and Huron; and Fort St Joseph, upon an island at the western end of Lake Huron, and particularly essential to the commercial interests of Canada.

Name. The import of the word Canada, and the reason of the country having been so named, are equally unknown; and, as a sufficient proof how little certainty there is on the subject, the following account of the matter, more ludicrous than satisfactory, may be submitted to the reader. A band of Spaniards having landed on the coast in quest of gold, which was then the sole object of pursuit with every voyager to America, and finding that the country yielded none of their favourite metal, frequently exclaimed to one another on their departure, in the presence of the natives, Acce nada, i. e. there is nothing. Upon the arrival of the French some time afterwards, the Indians, with a view to hasten their departure also, repeatedly pronounced the words which they had heard from their former visitors at their re-embarkation; upon which their new friends, imagining that it was the name of the country, immediately called it Canada.

Discovery and History. This country appears to have been first discovered in 1495, by the famous Italian adventurer John Cabot, who sailed under a commission from Henry VII. of England, but who was not permitted by that cautious prince to attempt any regular settlement on the coast. In the beginning of the 16th century, it was visited by some French mariners, who were fishing on the banks of Newfoundland; and, in 1520, Francis I. sent four ships under the command of Verazani, a Florentine, to make discoveries in North America; but, after two unsuccessful attempts, having sailed from a third expedition, he was never heard of more. In 1544, Jacques Cartier, a native of St Malo, sailing under a commission from the French king, landed at several places on the coast of the Gulf of St Lawrence, and took possession of the country in the name of his sovereign.

In the year following, he made a second voyage, with a more formal commission, and with a much larger force; sailed up the St Lawrence, as far as the island of Orleans; experienced the most hospitable treatment from the natives; and, after wintering at St Croix, returned to France, with a flaming account of the fertility of the soil, and the value of the productions, but with no specimens of the precious metals. His failure in the discovery of these last mentioned commodities, brought him into some degree of disgrace; and in 1546, he was sent out only in the capacity of pilot to M. de Roberval, who was appointed viceroy of Canada; who made various attempts to discover a north-west passage to the East Indies; who frequently returned to France for new recruits; and who was lost, with a numerous train of adventurers, in 1749, without any tidings ever being received of his fate. By this calamitous event the government of France was so much discouraged, that, for nearly 50 years afterwards, no measures were employed to support the few French settlers, who still remained in North America. At length, Henry IV. appointed the Marquis de la Roche, lieutenant general of Canada; but that nobleman, sailing from France in 1598, having injudiciously attempted a settlement on the isle of Sable, and cruized for some time on the coast of Nova Scotia, without any success, returned home in disgrace, and died of grief. Other governors, however, were more successful in their expeditions; and by the increasing attractions of the fur-trade, were enabled to collect great numbers of settlers, and to form a permanent establishment in Canada, or New France, as it was then designated. One of the most active of these adventurers was a naval officer called Champlain, a man of considerable enterprise and ability, who completely explored the banks of the St Lawrence, discovered the lake, which bears his name, and built the city of Quebec in the year 1608. At this period two Indian nations, the Algonquins and Hurons, who occupied the district in which the new colony was planted, happened to be very hard pressed by their invertebrate enemies the Iroquois; and, in the hope of procuring important assistance to their cause, readily welcomed and befriended the new settlers. Champlain, instead of endeavouring to unite the natives in general in an attachment to France, inconsiderately took a side in their contests; and thus raised up an enemy, of whose power and ferocity he was little aware, and whose rooted hostility presented perpetual obstructions to the future prosperity of the colony. The Iroquois never forgave this interference on the part of the French; and kept them in such a state of almost unceasing warfare, that, during a whole century at least, the European residents were never altogether free from fear; were seldom permitted to reap and sow in safety; and were frequently in hazard of total extermination.

The infant colony was, for a long time, very much neglected by the mother country; and its support was chiefly entrusted to private individuals, who fitted out expeditions at their own expense and risk. As the persons, however, who conducted these enterprises, were generally men of rank and fortune; and as they received from government the exclusive right to trade with the Indians in furs; they found no difficulty in procuring as many individuals to accompany them, as they were able to support; but still, their strength and numbers were never sufficient to ensure protection against the barbarous incursions of the savages.

The province of New France very soon became as much a missionary station, as a commercial settle-
ment. A very general zeal for the Christian instruction of the Indians, was excited throughout the French empire; and many individuals of rank and property devoted their lives and their fortunes to the cause. The Jesuits, however, soon engrossed the sole direction of this undertaking; and were greatly instrumental in obstructing the prosperity of the colony, both by their perpetual contentions, which they maintained with the governors, and by the pernicious effects which their labours produced upon the character of the natives. The individuals, indeed, who were personally employed as missionaries, were generally men of true piety, always possessed of undaunted zeal, and frequently distinguished by extraordinary talents. Their astonishing hardships, unceasing perseverance, and heroic sufferings, can never be too highly applauded, and can scarcely be adequately described. Besides the ordinary perils and privations, to which they were daily exposed, they have often been known to rush into the midst of contending savage armies, for the purpose of discharging the duties of their office; calmly to employ themselves, amidst the horrid carnage of an Indian engagement, in baptizing the wounded and the dying; and generally in such cases to terminate their labours by the patient endurance of the most excruciating tortures. But all their exertions were unhappily attended with very little success; and in some respects even proved rather hurtful than beneficial. They habituated themselves to the modes of savage life; assumed the dress and occupations of the Indian tribes, whom they went to instruct; rendered themselves in a great measure dependent upon their protection and services; and in this manner too often incurred the contempt, instead of acquiring the veneration of the natives. Even when they were successful in their ministrations, they may be said to have made allies to the French, rather than converts to Christianity. They did little more, in most cases, than admit the Indians by baptism into the bosom of the Catholic church, instruct them in a few unmeaning ceremonies, and inspire them with a bigotted hatred of the unconverted tribes; while they left them as rude with regard to the arts of life, as ignorant of the principles of society, as averse to industrious habits, as regardless of Christian duties, as complete barbarians in short, in every respect, as ever they had been. Their converts even lost, in a great degree, the useful qualities of the savage, without acquiring the virtues of the Christian; relaxed their wonted courage and vigilance, and trusted to the Saints for defence against their enemies; depended upon their new allies, in many instances, both for protection and provisions; and thus became a heavy burden, instead of proving a useful barrier to the colony. The degraded appearance, also, and enfeebled spirit of the Indian band, who thus submitted to the tuition of the Catholic colonists in Canada, compared with the industrious pursuits, orderly conduct, improved habits, and increasing comforts of those, who were instructed by the protestant missionaries, on the borders of New England, tended greatly to inspire the natives, in general, with a growing respect and attachment to the English, while it confirmed their contempt and dislike of the French. The English colonists naturally exerted their endeavours to encourage this predilection; and many of the Indians became still more partial to their intercourse, for this additional reason, that they found in these states a better price for their furs, than what the French merchants could afford. These two circumstances, the mutual hatred of the converted and unconverted natives of Canada, the former of whom were generally in alliance with the settlement at Quebec; and the principle, which the French adopted of treating all those Indian tribes as enemies, who carried their commodities to the traders of New England, or who received English missionaries among them, kept the province of Canada in a state of perpetual contest, as long as it remained in the possession of France. These ecclesiastical proceedings were so interwoven with the civil affairs of the colony, and had such an influence even upon its commercial interests, that this short sketch of their nature and effects, seemed necessary to explain and account for succeeding events; but it has led us rather to anticipate the general history of the province, and we now return to the narrative of a few of the most prominent particulars in its progress.

Until the year 1637, the prosperity of the settlement was greatly retarded by religious dissensions among the colonists themselves; but, at this period, the French minister, Richelieu, who cordially hated the Protestants, put the province of New France under the management of a chartered company. He endowed them with great privileges, upon condition, that they should exclude the Huguenots, and establish Catholic priests in every district; and gave them a constitution, which, with the exception of what regarded religion, has been reckoned as a model for colonial establishments. About this time Charles I. of England entered into a war with France; and Sir David Kirk, or rather Kertk, a French Calvinist, having received the command of three English ships, sailed upon an expedition against Quebec; defeated the squadron which was sent to its relief; and, after reducing the colonists to the greatest extremities, compelled them to capitulate in the year 1629. He fulfilled so faithfully the terms of surrender, and treated the vanquished with so much humanity, that the greater part of the settlers declined the privilege of being conveyed to old France, and remained under their conquerors in Canada. The colony was restored to France by the treaty of St Germain, in 1632; but it was only by the most astonishing exertions of a succession of able and enterprising governors, that its existence was preserved amidst the various difficulties, under which it laboured. From the neglect which it experienced on the part of the mother country, from its own intestine divisions, and from the desolating excursions of the hostile Indians.

About the year 1662, it was reduced to the eve of destruction by the rash and haughty temper of the governor general, D'Avaugour. Previous to that period, he had issued the strictest orders against selling spirituous liquors to the savages; and a woman of Quebec, having been detected in that pernicious traffic, was instantly committed to prison. By the entreaties of her relations, one of the fathers among the Jesuits was induced to intercede with the governor for her release. D'Avaugour, enraged to find
that his salutary regulations were thus thwarted by those, who, ought to have most vigorously seconded his injunctions, replied, in a paroxysm of passion, that, since the crime was not punishable in that woman, neither should it be so in any other person. He considered it as a point of honour not to retract his declaration; and, in consequence of the licence thus permitted in the disposal of ardent spirits, both the natives and the soldiery became so completely debauched, that all order and decency were disregarded, the clergy openly insulted, and the bishop compelled to embark for France, in order to lay his complaints before the king. Almost immediately after his departure, the whole system of nature in Canada appeared to have undergone a fatal revolution. The most tremendous hurricanes, earthquakes, thunderings, and fiery meteors, prevailed almost every quarter of the province, to a degree altogether unprecedented in that country. The largest trees were torn up by the roots, and the rivers turned out of their courses; mountains were overthrown from their foundations, and whole districts enveloped in flames, which issued from the bowels of the earth; the coasts were covered with sea monsters cast ashore, and every element, in short, seemed labouring to announce the dissolution of the world. These awful calamities were so

The following particulars of this remarkable event, extracted from the journal of the French Jesuits at Quebec, and first published in Lambert's Travels in Canada, (though rather to be regarded as a curious legend, than a creditable record,) may prove interesting to our readers. "It was on the 5th of February 1663, about half past five o'clock in the evening, that a great rushing noise was heard throughout the whole extent of Canada. This noise caused the people to run out of their houses into the streets, as if their habitations had been on fire; but, instead of flames and smoke, they were surprised to see the walls reeling backwards and forwards, and the stones moving, as if they had been detached from each other. The bells rang of their own accord. The roofs of the buildings bent down, first on one side, and then on the other. The timbers, rafters, and planks cracked. The earth trembled violently, and caused the stakes of the palisades and posts in a instant to sink in the earth. We cannot say what would not have occurred, but that we did not see it in reality or that moment it was, that every one ran out of doors. Then were to be seen animals flying in all directions; children crying and screaming in the streets; men and women seized with affright, stood horror-struck with the dreadful scene before them, unable to move, and ignorant where to fly for refuge from the tottering walls and trembling earth, which threatened, every instant, to crush them to death, or sink them into a profound and immeasurable abyss. Some threw themselves on their knees in the snow, crossing their breasts, and calling upon their saints to relieve them from the dangers, with which they were surrounded. Others passed the rest of this dreadful night in prayers; for the earthquake ceased not, but continued at short intervals, with a certain undulating impatience, resembling the waves of the ocean; and the same qualmishe sensation, or sickness at the stomach, was felt during the shocks, as is experienced in a vessel at sea. The violence of the earthquake was greatest in the forests, where it appeared as if there was a battle raging between the trees, for not only their branches were destroyed, but even their trunks are said to have been detached from their places, and dashed against each other with inconceivable violence and confusion; so much so, that the Indians, in their figurative manner of speaking, declared, that all the forests were drunk. The war, also, seemed to be carried on between the mountains, some of which were torn from their beds and thrown upon others, leaving immense chasms in the places from whence they had issued; and the very trees, with which they were covered, sunk down, leaving only the tops above the surface of the earth. Others were completely overturned, their branches buried in the earth, and the roots only remained above ground. During this general wreck of nature, the ice, upwards of six feet thick, was rent and thrown up in large pieces; and from the openings in many parts, there issued thick clouds of smoke, or fountains of dirt and sand, which spat up to a very considerable height. The springs were either upheaved or impregnated with sulphur. Many rivers were totally lost; others were diverted from their course, and their waters entirely utterly devoured. Some of them became red, and the great river of St Lawrence appeared entirely white as far down as Tadousac. This extraordinary phenomenon must astonish those who knew the size of the river, and the immense body of water in various parts, which must have required such an abundance of matter to whiten it. They write from Montreal, that, during the earthquake, they plainly saw the staves of the picketing, or palisades, jump up, as if they had been dancing; that, of two doors in the same room, one opened and the other shut of their own accord; that the chimneys and tops of the houses bent, like the branches of trees agitated by the wind; that, when they went to their windows, they felt the earth following them, and rising at every step they took, sometimes striking against the sole of the foot and other things in a very forcible and surprising manner. From Three Rivers they write, that the first shock was the most violent, and continued with a noise resembling thunder. The houses were agitated in the same manner, as the tops of trees during a tempest, with a noise, as if fire was crackling in the garrets. The first shock lasted half an hour, or rather better, though its greatest force was properly not more than a quarter of an hour; and we believe there was not a single shock, which did not cause the earth to open more or less. As for the rest, we have remarked, that, though this earthquake continued almost without intermission, yet it was not always of an equal violence. Sometimes it was like the pitching of a large vessel, which dragged heavily at her anchors; and it was this motion, which occasioned many to have a giddiness in their heads, and qualmishe at their stomachs. At other times, the motion was hurried and irregular, creating sudden jerks, some of which were extremely violent, but the most common was a slight tremulous motion, which occurred frequently with little noise. Many of the French inhabitants and Indians who were eye-witnesses of the scene, state, that a great way up the river of Trois-rivieres, about 15 miles above Quebec, the hills, which border the river on either side, and which were of a prodigious height, were torn from their foundations, and plunged into the river, causing it to change its course, and spread itself over a large tract of land recently cleared; the broken earth mixed with the waters, and, for several months, changed the colour of the great river St Lawrence, into which the waters of the Trois-rivieres disembogued. In the convulsion of nature, lakes appeared where none ever existed before; mountains were overthrown, swallowed up by the gaping earth, or precipitated into adjacent rivers, leaving in their place frightful chasms or level plains. Falls and rapids were changed into gentle streams; and gentle streams into falls and rapids. Rivers, in many parts of the country, sought other beds, or totally disappeared. The earth and the mountains were violently split and rent in innumerable places, creating chasms, whose depths are, and may never yet be ascertained. Such devastation was also occasioned in the woods, that more than a thousand acres, in one neighbourhood, and which were completely overthrown, and where, but a short time before, a thing met the eye but one immense forest of trees, now to be seen extensive cleared lands, apparently just turned up by the plough. At Tadousac, about 150 miles below Quebec, on the north shore, the effect of the earthquake was not less violent than in other places, and such a heavy shower of volcanic ashes fell in that neighbourhood, particularly in the river St Lawrence, that the waters were as violently agitated as during a tempest. Near St Paul's bay, about 50 miles below Quebec, on the north side, a mountain, about a quarter of a league in circumference, situated on the shore of the St Lawrence, was precipitated into the river; but, as if it had only made a plunge, it arose from the bottom, and became a small island, forma
powerfully seconded by warnings and exhortations of the clergy, that a general reformation was effected, both among the French and Indian residents. The baneful commerce in spiritious liquors was universally proscribed; nothing was to be seen but penances, processions, and pilgrimages; and the affairs of New France began to assume an entirely new and highly promising appearance. The company of Canada, however, either unwilling or unable to support, any longer, so unprofitable a settlement, made a voluntary surrender of their rights to the French king in 1664, who entirely new modelled the government of the colony; but committed the trade of the country to the company des Indes Occidentales. Considerable reinforcements, both of troops and settlers, were sent from France. Numerous forts were erected along the lakes, to check the encroaching commerce of New England, to protect the Canadian traders in their excursions, and to keep the hostile Indians in awe. The attention of the French court was strongly attracted to its American possessions, by the able representation of M. Talon, intendant of Quebec; and it is from the active administration of this enlightened magistrate, that the province of New France dates its prosperity.

About the same time the Jesuit missionaries began to have at least more political success among many of the more distant savage tribes. Besides the Hurons, Algonquins, Outaouais, and particularly the Abenakis, who had long been their allies, the Outagamis or Foxes, the Illinois, the Sioux, the Assinibois, the Knistenaux or Creek Indians, the Nipissings, &c. were brought to a friendly intercourse with the colony. Many powerful chiefs, also, among the Ondagas or Onontagues, the Agniers, the Oneywouths, the Tsonnonthouans, and other nearer branches of the hitherto hostile Iroquois, became converts to Christianity, and were of the greatest service in attaching their countrymen to the French interest. But the colonists of New France, always intoxicated with the idea of their national greatness, were continually exciting the jealousy and hostility of their Indian neighbours, by attempting to treat them as subjects rather than as allies, or by endeavouring to gain advantages over them, through manoeuvring and treachery; while, by imitating the savage practices of the natives in the field of battle, and wasting their strength in ill-concerted expeditions, they only exposed their own inferiority, and incurred the contempt of their enemies. Their trade with most of the Indian tribes was thus daily declining, while the influence of the English, on the contrary, was rapidly gaining ground; and hence it was resolved, in the year 1689, seriously to attempt the conquest of New York, as the only mean of securing the prosperity of Canada. The French court readily approved of the plan; and though a negotiation was actually pending at the time, for adjusting the claims of the two nations in America, the government of Canada was authorized to make a secret expedition against the English, without any formal intimation of hostilities. The measure was as bloodily executed, as it had been dis-honourably devised; and, in a cowardly assault upon some of the settlements in New York, even the defenceless women and children were cruelly put to the sword. The English being thus well advertised of the inveteracy of their enemy, soon discovered, on their part, that the reduction of New France was equally essential to the existence of their colonies; and from this period to the final conquest of Canada, the history of that province exhibits a continued and systematic struggle between the French and English colonies in North America, to enlarge their Indian alliances, to extend their share in the fur-trade, to encroach upon each other's boundaries, and to hasten the complete subjugation of the rival settlement.

It would not be easy, and it is now altogether immaterial, to ascertain the justice of their respective claims, and alleged reasons of invasion. It may be mentioned, however, in general, that the English had fairly bargained and faithfully purchased from the Indians the greater part of their territories; and that, therefore, they had a just title both to claim a property in the lands themselves, and to regard as subjects of Great Britain, those savage tribes who remained upon the soil, under the protection of their government. They enforced this claim, however, so gently, that the Indians, while they enjoyed the greatest advantages, experienced no sense of subjugation, but were always treated as a free and independent nation, even while receiving pay as auxiliaries in the field. The French, on the other hand, claimed a direct dominion over all the native tribes in North America, and even over such as, by long residence, had become naturalized subjects of Britain; because, as they alleged, they were the descendants of nations who had

† It was afterwards found to have extended through Upper Canada, where it overturned a chain of free-stone mountains, more than 300 miles in length.
The efforts of the English, however, in the course of the war were of little avail. They had been so fully occupied with their own affairs that they had no leisure to attend to those of their allies. The Indian tribes were divided in their opinions, and the French, as usual, took advantage of their differences. They made use of the Indians' enmity to their own advantage, and were able to keep them in a state of constant ferment.

The following account is taken from a document published in the year 1759, and is a faithful report of the events that took place.

**The Battle of Plains of Abraham.**

On the 13th of September, 1759, the British army under General Wolfe advanced towards Quebec. The French, under General Montcalm, were posted on the Plains of Abraham, in the expectation of an attack.

The British troops advanced in three divisions, under the command of General Wolfe, General Hawley, and General Mann. The French were surprised by the unexpected attack, and were soon driven from their works. The British gained a complete victory, and the French were compelled to retreat. The battle lasted for several hours, and the French lost a great number of men.

The British troops, after the battle, proceeded to the capture of Quebec, and the French were compelled to surrender.

**The Capture of Quebec.**

On the 13th of October, 1759, the British army entered Quebec, and the French were compelled to surrender. The city was invested by the British, and the French garrison was compelled to capitulate.

The British troops, after the capture of Quebec, proceeded to the capture of Montreal, which was also surrendered to the British.

**The Treaty of Paris.**

The Treaty of Paris, which ended the war, was signed on the 10th of February, 1763. The terms of the treaty were:

1. The French were to cede all their possessions in North America to the British.
2. The British were to pay the French 20,000,000 livres.
3. The British were to assume the debt of the French, and to allow the French to retain their credit in the British colonies.
4. The British were to grant the French the right of的方式, and to allow the French to retain their credit in the British colonies.

The treaty was signed by the British and French commissioners, and was ratified by the respective governments.

The following account is taken from a document published in the year 1764, and is a faithful report of the events that took place.

**The Battle of the Plains of Abraham.**

On the 13th of September, 1759, the British army under General Wolfe advanced towards Quebec. The French, under General Montcalm, were posted on the Plains of Abraham, in the expectation of an attack.

The British troops advanced in three divisions, under the command of General Wolfe, General Hawley, and General Mann. The French were surprised by the unexpected attack, and were soon driven from their works. The British gained a complete victory, and the French were compelled to retreat. The battle lasted for several hours, and the French lost a great number of men.

The British troops, after the battle, proceeded to the capture of Quebec, and the French were compelled to surrender. The city was invested by the British, and the French garrison was compelled to capitulate.

The British troops, after the capture of Quebec, proceeded to the capture of Montreal, which was also surrendered to the British.

**The Treaty of Paris.**

The Treaty of Paris, which ended the war, was signed on the 10th of February, 1763. The terms of the treaty were:

1. The French were to cede all their possessions in North America to the British.
2. The British were to pay the French 20,000,000 livres.
3. The British were to assume the debt of the French, and to allow the French to retain their credit in the British colonies.
4. The British were to grant the French the right of superiority, and to allow the French to retain their credit in the British colonies.

The treaty was signed by the British and French commissioners, and was ratified by the respective governments.

The battle lasted for several hours, and the French lost a great number of men.

The British troops, after the battle, proceeded to the capture of Quebec, and the French were compelled to surrender. The city was invested by the British, and the French garrison was compelled to capitulate.

The British troops, after the capture of Quebec, proceeded to the capture of Montreal, which was also surrendered to the British.

**The Treaty of Paris.**

The Treaty of Paris, which ended the war, was signed on the 10th of February, 1763. The terms of the treaty were:

1. The French were to cede all their possessions in North America to the British.
2. The British were to pay the French 20,000,000 livres.
3. The British were to assume the debt of the French, and to allow the French to retain their credit in the British colonies.
4. The British were to grant the French the right of superiority, and to allow the French to retain their credit in the British colonies.

The treaty was signed by the British and French commissioners, and was ratified by the respective governments.
of getting out of the hands of the savages. I told him, that I would give him every assistance in my power, and to this purpose bid him lay hold; but in a few moments he was torn from my side, and by his shrieks I judged was soon demolished.”—“It was computed, that 1500 hundred persons were killed or made prisoners by these savages during this fatal day. Many of the latter were carried off by them, and never returned. A few, through favourable accidents, found their way back to their native country, after having experienced a long and severe captivity.”

“Thus the unprovoked cruelty of this commander was not approved by the generality of his countrymen, I have since been convinced by many proofs. One only, however, which I received from a person, who was witness to it, I shall at present give. A Canadian merchant, of some consideration, having heard of the surrender of the English fort, celebrated the fortunate event with great rejoicings and hospitality, according to the custom of that country; but no sooner did the news of the massacre, which ensued, reach his ears, than he put an immediate stop to the festivity, and exclaimed, in the severest terms, against the inhuman permission; declaring, at the same time, that those, who had connived at it, had thereby drawn down on that part of their king’s dominions the vengeance of heaven.” (See Carver’s Travels in North America, p. 316, &c.) It has been alleged, in extenuation of this bloody transaction, that it was impossible to restrain the fury of the Indians; but it will not be easy to convince the world, that a body of 10,000 Christian troops could not have prevented the massacre from becoming so general; and there is a practical proof of the contrary, in the conduct of Sir William Johnson in the invasion of Canada, who made such unwearied exertions to keep the Indians in the English army, within the bounds of humanity, that not a peasant, woman, or child was hurt by them, or even a house burnt, while they were in the enemy’s country.
